Request by Professor Flügkiger.—The late Professor Flügkiger has bequeathed to the Imperial University and National Library in Strasburg such of the scientific works in his private library as that institution may desire. Such a gift will be a welcome addition to the Library, and commemorates in a fitting manner the name of the donor.

Chemical Lecture Charts.—Messrs. Sampson Low, Marston and Co. have issued a series of chemical lecture charts, consisting of twenty-five sheets, each 40 inches by 30 inches. They are intended to supplement the use of apparatus, those details of chemical manipulation being figured which it is either impossible or very difficult to perform in the lecture-room, of which the isolation of fluoride, the liquefaction of oxygen, nitrogen, etc., and the electrolytic preparation of aluminum may be mentioned as examples. A large number of the figures depict such manufacturing processes as are necessary to be understood by all students of chemistry; for example, the manufacture of nitric acid, sulphuric acid, hydrochloric acid, boracic acid, etc., on a commercial scale; also the smelting of iron, the Bessemer process, Pattinson's process, the extraction of sulphur, distillation of iodine, extraction of phosphorus, and others.

British Association.—The British Association meets at Ipswich on September 11 next, under the presidency of Sir Douglas Galton. The list of presidents of sections is as follows:—Section A (mathematical and physical science), Professor W. M. Hicks, of Firth College, Sheffield; B (chemistry), Professor R. Meldola, of the City and Guilds Technical College; C (geology), Mr. W. Whitaker, of the Geological Survey; D (zoology, including animal physiology), Professor W. A. Herdman, of Liverpool University College; E (geography), Mr. H. J. Mackinder, reader at Oxford; F (economic science and statistics), Mr. L. L. Price, bursar of Oriel College, Oxford; G (mechanical science), Professor L. F. Vernon Harcourt, of University College, London; H (anthropology), Professor W. M. Flinders Petrie, of University College, London; K (botany), Mr. W. T. Thistlethwaite, director of the Royal Botanic Gardens, Kew. The two evening discourses will be given by Professor Silvanus Thompson, on "Magnetism in Rotation," and by Professor Percy F. Frankland, on "The Work of Pasteur and Its Various Developments." There will be, as usual, two soirées, and also excursions to places of interest in the neighbourhood of Ipswich.

Acetylene as an Illuminant.—The value of acetylene as an illuminant has been tested in the photo-chemical laboratory in Charlotteburg. The extremely high price of the gas (a cubic metre costing 50 marks), and its inferiority to coal gas when used in an incandescent burner, indicated its unsuitability for general illumination purposes, but most serious of all is the fact that after it had been kept for two days in a gasometer its illuminating power had almost entirely disappeared.

Conversations at St. Bartholomew's Hospital.—On the occasion of the centenary of the Abernethian Society, a conversation was held at St. Bartholomew's Hospital, and particular interest attached to the lantern demonstration by Dr. A. A. Kautz, of photomicrographs of bacteria. Dr. Kautz is Lecturer on Pathology to the Hospital, and chief of the Pathological Laboratory, and although quite a young man, has already achieved a European reputation as a bacteriologist.
HEROIC REMEDIES FOR INFLUENZA.—A "certain" cure for la grippe has been discovered by a Lieut.-Colonel and Master of Gymnastics, residing at Gifef, Sweden. In the first case experimentally upon—that of a stout man—he administered a mixture of one teaspoonful each of spirit of camphor and rectified turpentine, followed immediately by two aloe pills. The next day the patient "returned completely recovered, and remained so," having perspired freely and slept well. The experimenter next treated all the members of his family and other persons afflicted with influenza, "all of them with the same absolutely good effect." The aloe pills, he observes, are to be given in the presence of headache only.

SALE OF DIPHTHERIA ANTITOXIN IN ZURICH.—
The Board of Health in Zurich has issued the following instructions with regard to the sale of diphtheria antitoxin serum:—The sale of the serum is limited to the public pharmacies of the canton; it is to be included among the powerful drugs, and to be sold only when prescribed by a registered physician. The serum must be obtained from one of three stated factories, the name of which, together with the date of filling and other details, must appear on each label. It is also to be kept in a cool place, and not sold unless free from permanent cloudiness or from any considerable deposit.

NEWSPAPER ACCURACY.—In the report of the Annual Dinner of the Pharmaceutical Society, published in the Daily News of Wednesday last, there occurs an amusing mistake, Sir Richard Quain being described as the President of the Board of Trade. This slip is all the more remarkable since the Daily News is generally understood to be the organ of the present Government, and, as such, should be exceptionally acquainted with the various office-holders.

CONFERENCE BLUE LIST.—The list of subjects for papers, annually published in connection with the British Pharmaceutical Conference, is now being issued. Some new subjects have been added to the list published in the Journal last June, and the attention of those proposing to contribute papers this year is called to the fact that the Bournemouth meeting will commence on Tuesday, July 30, so that papers should be in the hands of the Executive Committee as early as possible in July.

PROCEEDINGS UNDER THE PHARMACY ACTS.—At the Bloomsbury County Court on Thursday, John S. Armitage, dentist, etc., 1, Colva Street, Dartmouth Park Hill, N., was proceeded against for penalties under the Pharmacy Act for keeping open shop and selling chlorodyne and Powell's balsam, he not being a registered chemist and druggist. Mrs. Lavinsia Hill, of 91, Lower Marsh, Lambeth, was similarly proceeded against for keeping open shop and selling Powell's balsam, and J. A. Hogg, 45, Walworth Road, S.E., for selling Hogg's rodention vermin killer, containing a very large proportion of arsenic. A report of the proceedings will appear in next week's Journal.

Parliamentary News.

ROYAL COMMISSION ON TUBERCULOSIS.

In the House of Commons, on Thursday, May 16, Mr. Shaw-Lefevre, in reply to Mr. Knowles and Mr. Field, said the Royal Commission on Tuberculosis had recommended in their Report that the Commissioners had arrived at various conclusions of fact as to the existence of tuberculosids in animals, and as to the possibility of its being communicated to consumers of meat and milk. These conclusions appeared to point to the expediency of an extension of the system of inspection of dairies, slaughterman's shops, and looked for, and reported to the general establishment of public slaughter-houses. Until the evidence taken by the Commission had been published, and time had been given for the consideration of the very large and difficult questions involved, he would be quite unable to state the intentions of the Government on these matters, or whether it was desirable to have a further inquiry.

FOOD AND DRUGS ACT—"DRUGS."

On Wednesday, May 22, Mr. Charles Unney, of Wright, Tayman and Unney, of Southwark, gave evidence before the Select Committee of the House of Commons in reference to the revision of the Sale of Food and Drugs Acts, 1875-1879, more especially as regards drugs. The Committee now taking evidence sat during most of last Session with SIR W. FOSTER, F.R.C.P., as Chairman. On Wednesday, when Mr. Unney gave his evidence, Sir Charles Cameron, Bart., M.P., was in the chair. So far, therefore, as the Medical Profession, Analysts, and the Drug Trade are concerned, all are singularly fortunate in having as members of their committee, gentlemen who not only are authorities on medicine, but who are also chemical experts. Mr. Unney, in speaking as a wholesale druggist and manufacturing chemist with thirty years' practical experience, stated that twenty years since there was a necessity for passing the Sale of Food and Drugs Act, and in his opinion the practical effect of the Act had been that the standard of drugs had in consequence of the Act been raised so that the drugs supplied in Great Britain to-day might be equalled, but certainly were not be surpassed, by the drug supply of any country in the world.

He thought that the authorities under the Act had proceeded with great moderation, and the much abused analysts had, as a body, done their work with an accuracy that was to be commended. Public analysts had, in his opinion, much difficulty in carrying out their share of the provisions of the Act, for they had to contend with the ugly fact that the British Pharmacopoeia was not by Statute constituted the legal authority for standards in drugs. Analysts were unfortunately sometimes asked to advise authorities upon the desirability of prosecutions being taken under the Act, and as a consequence occasional errors had been made.

As chemical assayers, their opinions were, of course, reliable, but on drugs their knowledge was superficial, and consequently misleading when they acted as no recommendations.

Analysts had still another difficulty, viz., the persistence of the public in its demand for household medicines, compounded or prepared from some antiquated formula, notwithstanding the British Pharmacopoeia may have contained a similar preparation.

Less friction would certainly have arisen if analysts had looked for, and reported to the authorities upon medicinal purity rather than for absolute chemical
purity, and had this been done some of the proceed- 
ing institutes in certain districts against sometimes as 
many as twenty or more persons on one occasion, 
would not have been taken, and the public would not 
have regarded the working of the Act as a piece of 
petto tyranny on retail traders.

Mr. Umney did not spare the drug brokers, who, he 
ated, sometimes offered a spurious drug, under the 
name of the drug which it most nearly resembled or 
for which it was hoped to substitute it. Such sales, 
he thought, should be as amenable to the law as 
those of the wholesale or retail druggist.

Then followed various suggestions for embodiment 
into a revised Food and Drugs Act.

Standards for Drugs.—A revised Act should state 
definitely that the standard of strength adopted by 
the British (or Imperial) Pharmacopoeia for the time 
being, would be the legal standard for all purposes of 
the Act, and that when any substances used in 
medicine were not described in the current Pharma- 
copoeia, then the standard mentioned in that particular 
Pharmacopoeia in which such drug appeared, whether 
it be a former edition of the British Pharmacopoeia, or 
editions of the London, Edinburgh, or Dublin pharma- 
copoeias, should be adopted.

In cases where the drug did not appear in any of 
the previous Pharmacopoeias but in those of France, 
Germany, or United States of America, etc., etc., Mr. 
Umney recommended that the standard of those phar- 
copoeias should be accepted, and in the absence of 
a standard for such drugs in any of the pharma- 
copoeias referred to, then the standard should be fixed 
by a committee, to the constitution of which he re- 
ferred later on.

As to the warranty of drugs, Mr. Umney thought it 
would be convenient if drugs were divided into two 
classes:

(a) Drugs that did not decompose or alter in respect 
to their medicinal property upon keeping. For 
these he recommended that a warranty of not less 
than six months and not more than twelve months 
might be given by the wholesale druggist and accepted by the 
purchaser.

(b) Drugs that decomposed or changed upon keep- 
ing, so that their medicinal efficacy was im- 
paired, he thought should be sold under a 
warning not exceeding one month.

As to the actual form of the warranty, Mr. Umney 
suggested that this might be given in one or two 
forms, or even both of the following forms:

(a) Either by a printed or written label affixed to 
each bottle, jar, parcel, or package thus:

"Warranted in conformity to the characters and 
tests of the British Pharmacopoeia."

(b) Or the invoice in which the purchaser is de- 
bited with the goods might be the actual 

Mr. Umney thought that there should be a more 
complete definition of the word "Drugs" than 
appeared in the old Act, so that when substances 
which were used for food, or in the arts, or for house- 
hold purposes, found places in the Pharmacopoeia, and 
were used for medicinal purposes, there should not be 
the oftentimes characterised proceedings under the Act as to whether the substance was 
a drug or not. He laid special stress on the desirability 
of constituting a council or committee of advice (or 
reference), as by it, and by it only, he was of opinion, 
in cases of dispute, pharmacists would, under all 
circumstances, be treated with fairness and justice.

His view is that an authority so constituted 
under the Act should consist of nominees of the 
General Medical Council, the Inland Revenue 
authorities, Somerset House, the Institute of Chemis-

try, the Pharmaceutical Society of Great Britain, and 
the London Chamber of Commerce.

The opinions and advice that such a committee 
gave would not fail to be invaluable to authorities 
under the Act, whether prior to proceedings being taken 
or on a case of reference prior to a final judgment.

Mr. Umney also stated that as a member of the 
committee recently appointed by the Pharmaceutical 
Society to aid the Medical Council in constructing a 
new Pharmacopoeia, he should not fail to urge upon 
his colleagues on that Committee, in the compila-
tion of a new edition of the British (or Imperial) 
Pharmacopoeia, the absolute necessity of framing such 
characters and tests for chemicals, galenical prepara-
tions, essential oils, etc. so that a new edition would 
be a comprehensive one for legal standards.

Mr. Umney finally made a suggestion that it might 
be found convenient to work the Act of Parliament, 
in so far as drugs were concerned, as a sub-section of 
the Act. He thought that if it were so worked it 
would be freed from much of the complicated and 
umbersome machinery of the entire Act.

FORMULE FOR OINTMENTS WITH ADEPS 
LAME.

COOLING OINTMENT.

Adose lane, 20 parts; rose water or lime water, 30 
and 45 parts; benzoin in fine powder or oxide of zinc, 
30 parts.

FIRM PASTE FOR ECEMA.

Oxide of zinc, 6 parts; precipitated sulphur, 
3 parts; white fuller's earth, 2 parts; adose lane and 
benzoin, of each 14 parts.

BOIL PASTE FOR ECEMA.

Oxide of zinc, French chalk, of each 2 parts; olive 
and lime water, of each 2 parts; adose lane, 4 parts; 
tincture of benzoin, 1 part.

OINTMENT FOR CHILBLAINS.

Camphor, 3 parts; balsam of Peru, 1 part; oil of 
sweet almonds, 16 parts; adose lane and rose water, 
of each 20 parts.

COLD CREAM.

Botas, 2 parts; liquid neutral soap, 1 part; adose 
lane, 20 parts; rose water, 2 parts; tincture of benzoin, 
1 part.

OINTMENT FOR PSORIAS.

Oil of calced, 10 parts; adose lane, 20 parts; zinc 
ationt, 30 parts; solution of chromated lime, 40 parts.

MERCURIAL OINTMENT WITH ADEPS LAME.

Mercury, 20 parts; adose lane, 25 parts; benzoin 
in powder, 15 parts; oil of bergamot, 1 part.

UNCUTGUE INJECTION FOR CHRONIC URETHRIT.

Silver nitrate, 1 to 24 parts; oil of sweet almonds, 
10 parts; adose lane, 40 parts; distilled water, q.s. 

Notes in Brief.

DISTILLED WATER from which all gases had been 
set free, protected by covering it with oil, has been 
frozen by Prompt without any dilution of the volume 
originally taken.

ARBESIN OR MERCURY may be made into pills says 
Lang. Mon. f. Bakt. Dern.), by employing a mass 
consisting of milk sugar, 2 or 3 parts, and lanolin, 
1 part.

IRON NITROSO-COMPOUNDS, forming a new series, 
have been discovered by K. A. Hofman, and O. F. 
Wiede, and constitutes interesting examples of the 
synthetic production of complex inorganic substances.
Miscellaneous News.

[Readers are invited to send local information of pharmaceutical interest. The newspapers are sent the paragraphs to be noted should be plainly marked, whilst cuttings should be verified by the addition of source and date.]

AN INTERESTING ELECTROLYTIC PHENOMENON.—The Electrician records that at a recent meeting of the Scientific Instrument Makers' Association Mr. G. J. Reed described a curious electrolytic phenomenon observed by him. Most metals, when used as positive electrodes in electrolysis, are, he remarked, either dissolved or corroded, producing metallic salts or oxides; but when used as negative electrodes, metals do not generally undergo such corrosion. While experimenting, however, on the oxidising effect of various electrolytes upon lead electrodes, Mr. Reed noticed, accidentally, that under certain circumstances, lead behaved towards some electrolytes in a peculiar manner, the only conditions required being very high electromotive force and current density. On passing an electrolytic current through a solution of disodium hydrogen phosphate, between electrodes of sheet lead, nothing unusual was noticed during the experiment. The solution had a very high resistance, and very little current passed even with a high electromotive force. At the close of the experiment, there being no switch in the circuit, the current was interrupted by lifting one of the electrodes out of the solution. It happened to be the negative electrode. At the instant of final contact between the electrolyte and the lowest point of the electrode, as it left the solution, what appeared to be a cloud of black smoke, or precipitate, which had suddenly formed in the solution, was noticed. On examining the cloud more particularly, and repeating the experiment several times, it was found that by exposing only a very small surface of the negative electrode to the solution, there was produced a large cloud of dark blue or lead-colored precipitate, which rapidly sank to the bottom of the solution, and rendered the entire solution opaque. It was then observed that the lead cathode was being rapidly eaten away, and that the precipitate was being produced at the expense of the lead. The precipitate was collected on a filter, washed with water and alcohol, and dried. It was found to be an impalpable powdery lead, and the precipitation in the solution continued at ordinary temperatures. When rubbed in an agate mortar, it was reduced to a lustreless gummy mass, but did not assume a metallic appearance. Heated to the melting point of lead in the open air, it suddenly absorbed oxygen and formed yellow plumbic oxide with incandescence. Heated to the glass tube in absence of oxygen, it melted to a globule of metallic lead. The surface of the lead cathode, after the experiment, was reduced to a point at the end, and presented a smooth, shiny surface, like polished lead. It was of the form one would expect to find a positive electrode of copper or silver, not lead. Other electrolytes were tried, and it was found that the lead precipitate could be produced in them.

ROYAL INSTITUTION.—On the occasion of Professor Dewar's final lecture on "The Liquefaction of Gases," on May 16, the experiments, according to the Daily Chronicle, were in the main a repetition of those given on previous occasions. They illustrate the physical and chemical effects of liquid oxygen as a cooling agent in scientific research where the behaviour of matter at very low temperatures is under examination. There were, however, one or two new points touched upon. It is found that, although chemical action ceases at the boiling-point of oxygen, yet if a sufficient local heat can only be kept up at any point in the fluid it is possible to maintain combustion there. In such a case, clearly, the combustion must be taking place in a kind of vessel or sac of liberated gas, the burning substance being out of contact with the liquid oxygen, and therefore at a much higher temperature. Professor Dewar performed the experiment of igniting a burning jet of hydrogen gas right beneath the surface of a jar of liquid oxygen, and showed that the flame continued to burn fiercely, although surrounded on all sides by this inconceivably cold fluid. A large quantity of ozone was liberated during the process. In demonstrating the enormous increase in conductivity obtained by reducing metals down to minus 180° C, he pointed out the vast economy in electrical distribution which could be effected if it were only possible to keep our electrical cables at this low temperature. Another interesting experiment proved the extreme transparency of liquid oxygen to radiant heat. A lens-shaped globe was filled with the liquid, and the rays of the electric light being condensed through this vessel, it was shown that a piece of tinder could be rapidly ignited at their focus. It will be remembered that in Tyndall's famous experiment, where water was the liquid surrounded by a cylinder, almost completely filtered out the rays of radiant heat. Professor Dewar concluded a series of brilliant and highly successful experiments by freezing a soap bubble in the heavy layer of oxygen gas which lies floating on the surface of the liquid oxygen. The bubble, when frozen, presented the exact appearance of a decapitated egg-shell. In the future, the lecturers remarked, there remained a vast deal of work to be done, and doubtless they would be able to reach temperatures lower still. The very lowest temperature possible, he pointed out, was minus 273° C, the "absolute zero" of the physicist, which was probably the normal temperature of interstellar space.

TECHNICAL EDUCATION AND TRADES UNIONS.—A conference between some leaders in Technical Education and some officers of trade organisations was recently held at Watford, when the Chairman, Professor Dewar, said the occasion was that of the practicability of establishing a Technical College for Watford and West Herts. Technical classes already existed in connection with the public library at Watford; the question was whether or not these classes could be extended, and what connection could be formed with something already occupying a separate building. Two classes of persons were represented at this meeting—the public generally, and artisans in particular. It would be well to hear the views of any member of either class. Eight weeks previously he had ventured to ask the trade men and women of Watford what he would do with technical education, assuming they had got it. What would they do with young workmen whom a technical college has classified into good, better, and best? Would the trades unions come in and reduce them once more to the dull dead level of uniformity, all the men working for equal numbers of hours per day, and doing equal amounts of work, and earning equal amounts of money? For answer he had been told that the limit of the best workman to the output of the worst, and the consequent general degradation of the general capacity to the lowest level, though true years ago, is true no longer, the trades unions now demand high remuneration for good wages, and the slower workman too often having no work at all. With regard to the new unionism, no one could be expected to vote for a rate in aid of technical classes or to give ten pounds or a hundred towards a technical college whose students would be likely to be adherents of the socialistic new unionism. A man or
CHEMISTS' CO-OPERATION.—It is with much satisfaction that we hail the official announcement that the allotment letters in the Chemists' Co-operative Society were posted last week. It is not a very definite announcement, and somewhat tardy, seeing that it comes after a private reminder from ourselves, and so very long after the closing of the lists. The letter eighteen days ago, and the allotments must indeed have been numerous and complicated to render so much delay necessary. Yesterday a complaint came to hand from one who said he was a subscriber to the Society, who appealed to us apparently because of the adverse critic which we were compelled to make upon the prospects when recently appeared. The description lists, he said, were closed more than a fortnight ago, and no allotment had been made. He applied for a hundred shares, and as the delay in allotment struck him as ominous, he had twice written to the directors, demanding the refund of the amount which accompanied his application. To the first demand the secretary replied that the matter would be placed before the directors; to the second demand no reply has been vouchsafed. “Meanwhile,” he said, “the society are no doubt enjoying the interest on our application money.” We trust the complaint was unfounded, and there appears to be a mistake somewhere for our private application to the company they assured us that everything was in order, and asked us to refer complainants to them, which we have done. And they now issue the official announcement as to the posting of the allotment letters last week. It is an unprofessional act, of course we ought to hear more of the matter—the lesson remains that there should not be this delay on the part of new companies in issuing allotment letters.

A CAMPHOR FAMINE.—The news that the price of camphor was advancing at the rate of a penny or two per poundevery day, as the result of the recent war between China and Japan, and that England and the Continent were threatened with something like a camphor famine, has caused considerable alarm. That this should be so is not surprising, seeing that camphor is an article of daily consumption, and as a medicine in diseases from the most fatal form of Asiatic cholera to a mere cold in the head. Its value as a disinfectant is thoroughly established. Beyond this, its use has helped to check the spread of Asiatic cholera. It has been tried in Naples by the famous Dr. Negri, and by others, and its curative effects on cholera has never been disputed. In the great cholera epidemic of 1854 he administered camphor, taken internally, to 400 cholera patients, every one of whom recovered. Proctor, during the cholera epidemic in Liverpool in 1826, treated 125 cholera patients with camphor, and 124 were saved out of 125. The drug has indeed even more beneficial properties than the general public are aware of. A large dealer in the drug says the present unprecedented demand for it is due to the fact that more camphor has been sold for future delivery than is at the moment obtainable, and that the stock on hand does not exceed 4000 or 5000 cwt.

The greater portion of our camphor comes from China and Japan. Before the war it was cheap, but as soon as hostilities were begun the price went up. With the close of the war the manufacturers thought camphor had reached its top price and must recede, so they did not increase their stocks. But it turned out that they were wrong, and those who delayed buying had to pay a higher figure for camphor, the price of which, in fact, that of everything else, is regulated by the relation of demand to supply. Camphor costs to-day from £7 to £8 per case of a hundredweight; but a few years ago the price touched £2, and at a former period even reached £20. There is no reason why the price should not advance beyond the very moderate figure it stands at now, which is not excessive compared with what it was before the war. Camphor is dearer in China to-day than in London, a case that costs £1 16s. here being sold in China for £9.

It would appear, therefore, that there is less camphor in England to-day than is necessary to meet the requirements of the manufacturers; and when the Continental buyers begin to purchase heavily, it is more than likely that camphor may fetch as much as perhaps even £14 a case. A good deal of camphor is held by a syndicate, who, however, will, it is understood, sell to manufacturers at a moderate price sufficient camphor to carry on their business. But speculators who have sold camphor they did not have, and could not now obtain will suffer. Should a warm summer bring dysentery or cholera to England, the demand for the drug will be very great. Camphor has been nearly all obtained by the Chinese, who are greatly demoralised by the results of the war, or by the Japanese, whose Government have restricted the production by passing a law that the camphor trees shall not be cut down but only tapped. It will take the Chinese seven or eight months to prepare the new crop of camphor for the market, camphor-making from the gum being a very tedious process. The gum has to be washed and spread in the sun to dry, and undergo another treatment. Camphor-making is not a regularly organised industry, but a monopoly of certain tribes in China, some of whom are now in rebellion against the Government.

A CHEMIST CENSURED.—The coroner for the St. Clears district, on Saturday, May 11, severely commented on the conduct of a chemist named Morris William Jenkins, St. Clears, in supplying medicine for an old man named David Wilkins, whom he had not seen and without instructions from a medical man. The chemist supplied medicine for a bad cold, and the old man it was proved died from inflammation of the lungs.

ROYAL MICROSCOOPICAL SOCIETY.—May 15. The President A. D. Michael, Esq., in the chair. Mr. J. Swift exhibited an improved form of the Nelson microscope, made by Mr. T. Jenks; and a "Waller" microscope, which had been fitted with the new mechanical stage. Mr. T. Comber read a paper on the development of the young larve of Trachyna aspera; the subject was illustrated with lantern photographs exhibited upon the screen. Miss Ethel Sargent's paper, "On the First Nuclear Division in the Follen Mother-Cells of Llamia maragon," etc., was communicated by Dr. D. H. Scott. A discussion ensued, in which Professor J. B. Farmer, Mr. Spencer Moore, and Dr. Scott took part.
PHARMACEUTICAL JOURNAL. [May 25, 1893.

Irish News.

EXHIBITION AT BELFAST.—In the Arts and Industrial Exhibition at present being held in Belfast, which will in all probability be continued to the end of October, there is, as might be expected, a very large display of aerated waters of all kinds. Almost all the leading manufacturers have fine stands of exhibits. But while this is the case, there is a wonderful absence of pharmaceutical displays. In a city in which there are so many chemists supplying the public with good and evil, there is, as might be expected, a more extensive show of attractive cases was only to be expected. This, however, is not so. The principal houses are not represented anywhere, and the general absence of this class of goods is a subject of remark. At present, in the commercial capital of Ireland matters are tranquil in this trade. There is nothing specially noteworthy to be recorded.

DEVELOPMENT OF IRISH HEALTH RESORTS.—Steps are being taken to render Ireland more attractive to tourists by supplying better accommodation than has formerly existed. Thus, a new hotel has been opened at Bundoran, near Ballyshannon, on Donegal Bay, by the Great Northern Railway of Ireland, and the City of Derry, there is, as might be expected, a more extensive show of attractive cases was only to be expected. This, however, is not so. The principal houses are not represented anywhere, and the general absence of this class of goods is a subject of remark. At present, in the commercial capital of Ireland matters are tranquil in this trade. There is nothing specially noteworthy to be recorded.

CASES UNDER THE IRISH PHARMACY ACT.—On Monday, May 20, at Roscommon Petty Sessions, Mr. W. Lowden Browne presiding, Messrs. Daniel Walsh and Patrick Walsh, of Castle Street, Roscommon, appeared to answer three summonses at the suit of the Pharmaceutical Society of Ireland, the first of which charged them with having on March 1 last sold arsenic in a packet labelled "Cooper's sheep dipping powder." To the complainant, George A. Phillips, they not being properly qualified to do so; the second with keeping open shop for the retailling and dispensing of poisons without being qualified to do so; the third with selling a poison not labelled in the manner required by Section 2 of the 33rd and 34th Victoria, the Poisons Act. Mr. James Jones, of Castle Street, in the town, also appeared as the defendant in four summonses at the suit of the same Society, charging similar offences, the articles alleged to have been sold to the same complainant being "Biggs' sheep dipping composition" and "Cooper's sheep dipping powder." Mr. John M. Whelan, solicitor, of Roscommon, prosecuted on the part of the Society. Professor Tithborne, one of the members of the Council of the Society, was in attendance.

Mr. Joseph Burke, solicitor, appeared for the defendant Walsh.

Mr. Whelan said he appeared for the Pharmaceutical Society of Ireland to prosecute in these cases which were brought under Section 30 of the Irish Pharmacy Act of 1875 and the Poisons Act.

Mr. George A. Phillips, the Inspector of the Pharmaceutical Society, was sworn, and Mr. Whelan was asked examining him with regard to The Burke said he had a preliminary objection. It had been stated that these prosecutions were brought at the instance of the Pharmaceutical Society, but the complainant named in all the summonses was Mr. Phillips. Under Section 4 of the Act of 1875, the Pharmaceutical Society were made a corporate body capable of "suing and being sued." He submitted that the summonses should be dismissed.

After a considerable amount of argument, the Magistrate decided to adjourn the hearing of the summonses for not properly labelling poison until the next court day, and to dismiss without prejudice the other summonses.

Poisoning Cases and Inquests.

Belladonna and Aconite.—Annie Wittey, a schoolmistress, died at Alwalton, near Peterborough, from the effects of poison on Monday, May 6. Deceased was in the habit of taking sleeping draughts and of using liniment for her rheumatism, and the evidence at the inquest held on Monday was that he accidentally drank a quantity of the liniment, which contained belladonna and aconite, in mistake for the sleeping mixture. Verdict: Accidental death from poisoning.

Cyannide of Potassium.—Daniel Williams, aged 46, died at Low Spennymoor from the effects of cyanide of potassium, self-administered. At the inquest held on Friday, May 3, a verdict of Suicide whilst insane was returned.

Lanatus.—Richard George Tuckett, a journeyman baker, died on Thursday, May 9, at Islington, from the effects of lanatus, self-administered. Verdict: Suicide whilst insane.

Oxalic Acid.—Hannah Featherstone, aged 46, died on Saturday, May 11, at Bishop Auckland, from the effects of oxalic acid, self-administered. Verdict: Suicide.

Carbic Acid.—Martha Alice Rafferty, aged 27, died on Sunday, May 12, at Ealing Avenue, East Vale, London, from the effects of carbic acid, self-administered. Verdict: Suicide whilst insane.

Oxalic Acid.—John Gerrard, aged 53, died a Wednesday May 15, in the Southport Cemetery, Southport, Lancashire, from the effects of oxalic acid, self-administered. Verdict: Suicide whilst insane.

Strophan and Benem.—Ann Sumner, aged 31, died on Friday, May 10, at 7, Pharo Road, Eastwood, from the effects of strophan and arsenic contained in a mouse poison, self-administered. Verdict: Suicide whilst temporarily insane.

Vitriol.—Frederick Garner, aged 25, died on a Wednesday, May 15, at Mansfield, from the effects of vitriol, self-administered. Verdict: Deceased was unsound mind at the time he committed the act.

Carbic acid.—Sarah Graham, aged 25, died on a Thursday, May 16, in the Rochdale Infirmary, Rochdale, from the effects of carbic acid taken in mistake for tea. Verdict: Accidental Death.

Oxalic acid.—Louisa Lawton, aged 26, died on a Saturday, May 18, at Nelson Street, Hulme, from the effects of oxalic acid, self-administered. Verdict: Suicide whilst insane.

Carbic acid.—Mary Sheas, aged 22, died on a Friday, May 17, at 13, James Henry Street, Oxford Street, Manchester, from the effects of carbic acid, self-administered. Verdict: Suicide whilst temporarily insane.
**Country Notes.**

The Poisonous Property of the Shrew Mouse. — Both in this country and in Germany popular tradition in rural districts attributes poisonous effects to eating the shrew. Smith and the mouse. Scientific naturalists have discredited this belief, but the recent observations of Bury St. Edmunds, published in the *Revue des Sciences Naturelles*, tend to show that this popular reputation for toxicity may not be groundless. He observed that cats were afraid of the animal, and having caught one, he placed it in a cage with a common mouse. The latter, although tempted by the smell of the shrew, fled from its companion in fright, but nevertheless was bitten in the leg by its fellow prisoner. The bitten mouse speedily developed abnormal symptoms, and on releasing it, its hind-legs were found to be perfectly paralysed. It was enveloped in cotton wool, but the next morning was found dead without having moved from where it was placed. Considering that the wound caused by the bite of the shrew was very small, it would appear that the old tradition as to the poisonous properties of its bite, at least as regards the domestic mouse, is well founded.

**Preparations in Crucifers.** — The peculiar disease causing thickening of the roots of crucifers with the formation of numerous hard nodules so that the root soon decays, has been investigated at Kew. The results obtained by previous workers are confirmed, the disease being caused by a specific organism called *Plasmaphoros brassicae*, which, however, does not limit its attacks to cultivated plants, but occurs also on many common cruciferous weeds such as charlock, garlic mustard, treacle mustard, and shepherds purse. Hence it is necessary to prevent the growth of such weeds in fields and hedgebanks. The development of the organism is favoured by acids, but checked by the presence of alkalies, so that a dressing of lime, or of a manure containing potash salts, is effective, the last being most valuable, since it not only destroys the germs in the soil, but also arrests the disease in seedlings, and at the same time supplies a necessary ingredient for the healthy growth of turnips (C. R. Roy. Soc., May, 1890).

**Application for Prevention of the American Blight.** — Seventy-five parts soft soap, 5 parts linseed oil, and 25 parts carbolic acid are mixed. Add 1500 parts of water to the mixture before using. Equally suitable is a mixture of 4 parts carbolic acid with 100 parts of lampblack (C. R. Roy. Soc., May, 1890).

**Grafting Wax.** — 375 parts Burgundy pitch, 250 parts yellow wax, 100 parts Canada balsam, 75 parts olive oil or melted lard are melted together and then rolled out into sticks while soft. Or dissolve 5 parts of resin and 5 parts pitch, stir on the fire till liquid, remove and add gradually 1 part melted pitch. Preserve in well-stoppered bottles (Zeitschrift, xxxi., P. 249).

**Sticky Trap to Prevent Caterpillars Reaching Fruit Trees.** — Five hundred parts resin, 350 parts lard, and 350 to 500 parts of oil are melted together. Paste strips of brown paper round the trees and apply the hot varnish to these. This prevents the insects from climbing up the tree (ibid.).

**Ascochyla Pisi, an Injurious Fungus on Peas.** — The fungus *Ascochyla pisi* has been known for a long time as being destructive of the pea pod, but at the meeting of the Royal Horticultural Society of Berlin, Professor Beuth said that it also attacks the embryo. Such infected seeds are very difficult to recognise when dry, but by immersing them in water for twenty-four hours the mycelium develops and covers the swollen seed like a fine white skin about a millimetre thick; the seed then resembles a fly covered with the familiar *Saprolegnia*. Such infected seeds will grow to a height of 1½ to 2 feet, and appear quite healthy, but suddenly they dry up at the base, owing to the ravages of the fungus (*Gardener's Chronicle*, [3], xvii., 584).

**Immunity of Earthworms from Lead Poisoning.** — Hogg had noticed that the waste bark heap of the Elswick Lead Works was very prolific in earthworms, although the material of which the heap was composed was found to contain 0.26 per cent. of lead. The intestines of the worms are always filled with the bark; the amount of lead in the dried worms was found to range from 1.85 to 2.6 per cent. of Pb.O, and since the worms were found to contain an average of 80 per cent. moisture, this would show that the live worms contained from 0.87 to 1.02 per cent. of Pb.O. The amount of lead found in worms free from intestinal matter was from 0.009 per cent. to 0.018 per cent. Worms were kept in soil with as much as 5 per cent. of white lead for about two months, after which they disappeared; from starvation the author thinks rather than from poisoning (*Gardener's Chronicle*, i., xxiii., 329).

**Preparations for Destruction of Insects Injurious to Fruit Trees.** — The Board of Agriculture recommends several preparations for destroying caterpillars and other insect pests on fruit trees especially, apple, plum, and damson trees. The earthworms of the peat bogs and vegetable beds are the most destructive, and when they are found eating the leaves their progress should at once be checked. Where hop-washing machines are available they may be used with advantage for syringing large trees, with those of smaller growth, however, the ordinary garden engine will be sufficient.

The following are the mixtures recommended:—

No. 1. Quassia, 7 lbs.; soft soap, 5 lbs.; water to 100 gallons.

No. 2. Quassia, 5 lbs.; soft soap, 5 lbs.; paraffin oil, 5 pints; to 100 gallons of water.

No. 3. Quassia, 4 lbs.; soft soap, 4 lbs.; Calvert's carbolic acid No. 5, 4 pints; water to 100 gallons.

No. 4. Soft soap, 6 lbs.; finely powdered hellbore, 2 lbs.; paraffin oil, 1 quart; well-stirred together; water 100 gallons.

The soft soap should be dissolved in a tub of hot water; the quassia chips should be boiled in water put into another vessel; the paraffin oil (pure carbolic acid) is used it should be well stirred up with hot soap and water before adding cold water. It is important that syringing should be commenced early during the year, as there are any signs of infestation, and as the caterpillars appear in successive broods the syringings must be renewed if necessary.

Two arsenical preparations, Paris green and London purple, are largely used in America. They must, however, be used with great care. Paris green should be obtained in the damp form and mixed at the rate of 1 lb. to from 180 to 240 gallons of water according to their condition and age of the foliage. The mixture must be kept well stirred. It is not advisable to spray the arsenical solutions when the trees are in full blossom, unless the attack is very severe, in this case the solution must be weakened.

As the object is not to dislodge the larve, but to poison their food, the solution should be sprayed on in fine jets as gently as possible.

London purple is used in a similar way in the proportion of 1 lb. to 200 or 260 gallons of water. Stock must not be put upon the grass in orchards where these arsenical solutions have been used, nor must these dressings be used for gooseberries for early picking, and herbs and vegetables for early use (*Gardener's Chronicle*, [3], xvii., 588).

Applications for Patents.

[from the Illustrated Official Journal (Patents).]

No. 8444.—Improvements in apparatus for heating, cooling, or tempering water or liquids. April 29. No. 8462.—Improvement in ophthalmoscopes. April 30.

No. 8516.—Improvements connected with the treatment of resin or resins for cleansing and other suitable purposes. April 30.

No. 8534.—Improvements in bottle-stoppering devices. April 30.

No. 8656.—An improved photographic negative marker. May 1.

No. 8672.—Improvements in bottles applicable for medicinal purposes and the like. May 2.

No. 8699.—Perforated sticking-plaster. May 2.

No. 8829.—A new or improved medicinal compound. May 3.

No. 8853.—Improved air-tight cap for bottles or jars. May 4.

No. 8932.—Pneumatic truss or belt for surgical use. May 6.

No. 9059.—An expanding stopper for closing the neck of a bottle after the ordinary cork has been withdrawn. May 7.

No. 9058.—An improved temporary stoppering for bottles to enable their contents to be drawn off as required; also usable as an opener for internally-stoppered bottles. May 7.

No. 9118.—Improvements in and relating to inhalers for consumption and other patients. May 8.

No. 9154.—An improved bottling cork for liquids. May 8.

No. 9190.—Improvements in and in the mode of corking or stoppering glass, earthenware, and similar bottles for aerated waters and the like. May 9, 1895.

No. 9243.—Improvements in apparatus for producing an instantaneous "flash" light for photographic purposes. May 9.

No. 9223.—A novel process for treating and preparing ordinary gelatin bromide dry plates for transfer of negative photographs and the employment of such dry plates for direct printing by ordinary printer's ink. May 9.

No. 9278.—Apparatus for enabling the height of liquid in closed vessels to be seen. May 10, 1895.

No. 9385.—Improvements in and relating to appliances for spraying liquids on to surfaces. May 11.

No. 9393.—Improvements relating to the air-tight closing of bottles, jars, cans, and other receptacles or vessels for sterilised liquids, preserves, or the like. May 11.

Patents Published May 4.

Separating metals from ores (Atkins, G. J.).—The invention consists in replacing the potassium or other cyanide and the sodium chloride used in various processes for dissolving gold, platinum, silver, and other metals from their ores, by a "chloro-cyanide salt," preferably prepared by fusing together an alkaline ferro-cyanide such as that of potassium or sodium, with sodium chloride. Carbon may be added to minimise loss of cyanogen. In making the "chloro-cyanide salt," other than the above metals and cyanogen, to be used, and sulphuretted hydrogen may replace the ferro-cyanides. No. 7648 of 1894.

White lead (MacArthur, J. S.).—A weak neutral or slightly alkaline solution of potassium or sodium tartrate or of Rochelle salt is caused to percolate through a thin layer of mansecot, litharge, or other oxide of lead, or is agitated therewith as a boiling heat. The solution containing the bulk of the lead is filtered and a current of carbonic acid gas is passed through it at about the boiling temperature. The lead is gradually precipitated as carbonate. The liquor obtained on filtration is used for dissolving more lead oxide. No. 9056 of 1894.

Electrolysis of solutions (Holm, L. P.). The invention relates to the production of soluble products by electrolysis of solution, and comprises means for removing them as fast as they are formed, to prevent interference with the electric action. The ordinary porous diaphragms are dispensed with, and the electrodes are made of porous material, or are affixed to plates of such material. The liquid treated is passed at slight pressure, so that it tends to pass through the electrodes, and the result is that the products formed at the cathode and anode respectively pass through to receivers. The inventor states that by this method a minimum of current is required, and mentions its special applicability to the formation of caustic soda and hydriodic acid by electrolysis of brine. No. 11,987 of 1894.

Osmaco (Lamprey, J. H.).—The pointed or serrated conductors employed in the "silent discharge" apparatus commonly used for producing osmoc are replaced by wires, on which are strung metal beads alternating with glass beads or other non-conductors. The inventor prefers to have the wires thus formed and passed along both sides of a pair of glass slips between which runs the other conductor, consisting of a single strip of metal, or the latter conductor may be replaced by a rod running through a glass tube, around which the compound conductor is arranged spirally or otherwise. No. 1,510 of 1894.

Sulphuric acid (Staub, A.).—Instead of the ordinary leaden-chamber process the gases used for the manufacture of the acid are caused to pass up a column of a tower containing coke, perforated or other porous clay plates or pipes, or other material exposing a large surface, down which water slowly trickles. The waste gases escape at the top and the sulphuric acid that has been formed at the bottom of the tower is then passed in at slight pressure, and it is stated that less air is required than usual, and that a stronger acid is obtained. The waste gases may be passed through another tower, through which sulphuric acid is flowing; to absorb the nitric acid gas. The acid so produced is passed through the first tower, is then exposed to a current of air and sulphur dioxide to free it from the nitric acid and to concentrate it. The waste gas is again treated as above, so that as nitric gases are lost. No. 12,675 of 1894.

Treating nickel ores (Gibbs, W. T.).—Nickeliferous ores containing iron and copper are crushed, passed through a sieve of quarter-inch mesh, and roasted. The mixture of oxides of nickel, copper, and iron is then powdered and extracted with aqueous ammonia of specific gravity 0-900. The clear liquid containing the nickel and copper is heated in a series of three iron retorts, which may be connected so that the liquid passes successively through them. The nickel is precipitated as oxide or hydrate in the first retort, the copper as oxide in the third, and a mixture of the two in the second retort. Each retort has arrangements for condensing the ammonia which is evolved. No. 13,851 of 1894.

Vapourising perfumes, etc. (Breidenbach, R. B.).—The perfumed spirit, etc., is contained in a bottle, and the perfume is in the form of a glass or other small globe resting on the top of the cork and coated with platinum. On lighting the spirit at the wick the platinum becomes red-hot and retains its heat when the flame is blown out, by
Pharmaceutical Journal 1085

Mooting the oxidation of the spirit. The perfume is thus constantly evaporating. No. 2747 of 1895.

Acetic acid (Thompson, W. P., communicated from Lindo, C. von der).—Pyroglutmate of lime is decomposed by means of sulphuric or hydrochloric acid as usual, but the distillation by which the acetic acid is produced is separate from that by which the salt is produced, to prevent injury to the product by the distilling off of the tar products contained in the pyroglutmate. No. 3477 of 1895.

Bed pan (Diamond, M. S.).—The pan is of sheet zinc or other metal with the usual opening, but a hinged lid is packed with indiarubber in order to keep it watertight. The lid is formed at the thinnest end to facilitate cleaning. The handle is hollow, so that water may be poured through it into the pan. No. 4520 of 1895.

Bottles, stoppering (Brenzinger, A.).—The neck of the bottle is fitted with a valve, of which several forms are described by the inventor, so arranged that the contents may be discharged, but nothing can be poured into the bottle. No. 4583 of 1895.

Bottles, stoppering (Stevens, W. B.).—Comprises arrangements of valves or stoppers serving the same purpose as those described under the last patent, but of different construction. No. 4901 of 1895.

Patents Published May 11.

Homologues of vanillyl (Pitt, S., communicated from the "Chemische Fabrik auf Action," formerly E. Schering).—Refers to patents No. 24,177 and 24,178 of 1893, and consists in employing a method described therein as yielding vanillin, for the production of homologues of vanillin for use in perfumery. The inventors mention among these compounds the ethyl, propyl, butyl, iso-buty1, anil, and iso-ethyl ethers of protocatechuic aldehyde. The method of production is fully described, and consists in combining benzal-acetic acid with ethyl ether, propyl ether, etc., according to the ether which is required, saponifying it with potash, treating it with acid, dissolving out the compound with ether, and re-crystallising it from water. No. 10,112 of 1894.

Hydroxylamine, hydrozine, etc. (Wohl, A.).—The invention consists in condensing hydroxylamine, hydrozine, and their derivatives from nitrites, nitrites, ethers of nitric and nitrous acid, nitro-derivatives of the fatty and aromatic series, nitro-compounds, nitramines, nitroamines, etc., by means of finely divided zinc or other readily-oxidised metal acting in a neutral medium. In the presence or in a neutral salt, such as chlorate of sodium or calcium, the latter prevents the action of the base. The inventor describes the production of hydroxylamine free from ammonia from lead nitrate; of phenyl-hydroxylamine from nitro-benzene; of hydrozine from nitrosodiphénylamines; and of several analogous compounds. No. 11,216 of 1894.

Trade Marks Applied For.

[From the Trade Marks Journal.]

No. 186,748.—CHEMICAL SUBSTANCES used in manufacture, photography, or philosophical research, and anti-corrosives.—Burchard and Co., 35, Eastcheap, London, April 3, 1895. Device.—A Sword-fish.

No. 184,515.—A SANITARY DISINFECTING SOAP not soluble in water, others.—The British Sanitary Soap Co., Ltd., 64, Sutton Street, Tooley, Liverpool, December 27, 1894. The essential particulars are the following.—The words "Imperial Times" and the combination of clock face devices.

No. 183,651.—COD LIVER OIL.—John Thomson Coats.—"The International Pharmacy," 64 and 65, Tolbooth Wynd, Leith, November 14, 1894. Device of fishing boats at sea, and name and addresses of applicant. The essential particular is the combination of devices.

No. 183,850.—PERFUMERY, including toilet articles and perfumed soap.—Pissure and Lubin, 2, New Bond Street, London, W. November 23, 1894. Device—A musk deer and the words: "Trade Mark—Musk deer."

No. 187,025.—TOILET AND PERFUMED SOAP.—Price's Patent Candle Company, Limited, 81, Threadneedle Street, London, April 11, 1895. Device—A figure climbing a rope, formed at the thinnest end to facilitate cleaning. The handle is hollow, so that water may be poured through it into the pan. No. 4520 of 1895.

Obituary.

TOWNSEND.—On March 24, Charles Townsend, Chemist and Druggist, late of Addiscombe. (Aged 61.)

MAYS.—On May 16, R. J. J. Mays, Chemist and Druggist, Westoe, formerly of Byton-on-Tyne. (Aged 82 years.) Mr. Mays took a lively interest in public affairs, and was elected a member of the first Town Council for South Shields Ward, on November 13, 1850, to fill one of the vacancies caused by the election of an alderman, who had been returned as member of the Council on the 1st of that month, and was re-elected at subsequent dates. He was also a member of the Burial Board. The volunteer movement in its early days had in Mr. Mays an enthusiastic supporter, and he was identified for some years with the 6th Durham Rifles.

CLEGHORN.—On May 16, H. F. C. Cleghorn, M.D., Streatfeild, St. Andrews, N.B. Dr. Cleghorn was one of the oldest honorary members of the Pharmaceutical Society, having been elected in 1858. He was born in Madras on August 9, 1820, but educated at the High School of Edinburgh and at the University of St. Andrews. On leaving college in 1837 he was apprenticed to Professor Syme for five years, and held in the last year the position of house-surgeon in the Edinburgh Royal Infirmary. Graduating in 1841, he proceeded, at the age of twenty-two, to Madras, where he was attached to the Madras General Hospital to study Indian diseases. Later he was appointed Professor of Botany at the Government College, and Governor of Madras, Lord Harris, requested Dr. Cleghorn to undertake the task of organising a Forest Department, so that the wasteful system of native cultivation might be checked. Subsequently, he and Sir D. Brandis were appointed Joint Commissioners for the Conservancy of Forests; and in 1867, when Dr. Brandis returned home, Dr. Cleghorn acted as Inspector-General of Forests. Finally, in 1869, Dr. Cleghorn retired from the Indian Service, and his conscientious and able work while a member of it was acknowledged in a minute of the Government, which said: "His long services from the first organisation of forest management in Madras have without question greatly contributed to the public good in this branch of administration; and in the Punjab also Dr. Cleghorn's labours have prepared the way for the establishment of an efficient system of conservancy and working the forests of that province."

In 1885 the University of St. Andrews bestowed on him the honorary degree of Doctor of Laws, and in 1888 a large number of his friends presented him with his portrait in appreciation of his services to the cause of arboriculture in India and in this country. The sum of £200 over was, at his request, devoted to forming a Hugh Cleghorn Forestry Library in the Museum of Science and Art in Edinburgh.
New Remedies.

[The notes given under this heading for the information of dispensers, embody recent suggestions in their practice, and cover both new drugs and preparations, and old ones, under new aspects. The word "parts" is used to represent parts by weight, both for solids and liquids.]

OXYGEN GAS IN INFANTILE CATARRHAL PNEUMONIA.—Dr. J. Philip reports a case in which inhalation of oxygen gas had extraordinary restorative and sustaining effect in a nearly fatal case of pneumonia in a child aged thirteen months. When the gas was first applied in a gentle stream to the mouth and nostrils the patient was apparently sinking; after two hours the gas was applied at intervals, when collapse seemed imminent, as when the pulse became weak and cyanosis appeared; ultimately, in spite of a relapse, the child recovered (B. M. J., vol. 1, 1895, p. 1036).

PYROZILKOSIE ACID AS A DISINFECTION OF TUBERCULOUS SPUTUM.—According to Goriansky, pyrozilkosis acid is the most active of the wood-tar products for destroying tubercle bacilli, which it kills in cultures in one hour, and in sputum in two hours (Pub. Health, vol. vii., No. 8, p. 285, after Rev. d'Hygiene).

TREATMENT OF PHOBIA.—Coffin, in moderate cases, removes the scales by alkaline washes, and then applies glycerin of starch, oil of cade, of each 3 oz., soft soap, 75 grains, salicylic acid, 45 grains. The parts are washed with warm water and tar soap every three or four days. In obstinate cases the scales are removed and the following ointment employed:—Iothyl, pyrogallol, and salicylic acid, of each 30 grains; vaselin, lard, and lanolin, of each 1 ounce (Brit. Journ., Derm., vol. vii., p. 167, after Le Sperimentale).

IODOL IN AURAL ECZEMA.—In dry eczema of the auricle the parts are washed with a very weak warm solution of mercuric bichloride and the following salve applied:—Iodol, 15 grains; lanolin, 1 ounce. When the external meatus is involved the scales should be removed and the canal filled with iodol, 15 grains; while vaselin oil, 1 fluid ounce, and a plug of wool inserted to retain the fluid (Brit. Journ. Derm., vol. vii., p. 167, after Rev. Intern. de Bte. Med.).

GUAIACOL DRESSINGS IN GONORRHEAL ORCHITIS.—Taviani recommends guaiacol preferably in an ointment thus compounded:—Guaiacol, 5 parts; vaselin, 50 parts; to be applied locally to the affected part and to the groin.

PAPAINE IN ICHYOSIS.—Papaïne is administered in the following pigment in ichyosis:—Papaïne, 8 parts; salicylic acid, 4 parts; glycerin and castor oil of each 16 parts (Journ. des Mal. Cutan. et Syph., Feb. 1885).

GUAIACOL IN GASTRITIS.—Dr. Anders prescribes guaiacol in the following combination:—Guaiacol and glycerin of each 1 dram; spazminta water to 1 ounce. One dram to be taken every four hours (Therapeut. Gazette, March, 1886).

MYDRIATIC SOLUTION CAUSING A DILATATION OF THE PUPIL OF VERY SHORT DURATION.—Greeneou employs —Ephedrine hydrochlorate, 1 gramme; homatropine hydrochlorate, 1 centigramme; distilled water, 10 grammes. The instillation of 2 or 3 drops into the conjunctival sac causes a slightsmarting, and is followed by mydriasis, which attains its maximum in half an hour, but which completely disappears in an hour, while no paralysis of the ciliary muscle takes place, and the disturbance of vision is very slight and of short duration. The above solution gives better results than that of atropine in dilating the pupil for orthoscopic examination (Rev. Intern. de Med. et de Chir. Prat., April 10, 1885).

JAUNDICE AFTER MAIS FERN.—Grawitz has frequently observed jaundice to follow the administration of mais fern; the active agent in producing this is fillicoid acid, and as this is more readily absorbed when dissolved in fatty oils, he questions the wisdom of giving mais fern with castor oil. He also concludes that it is dangerous to give it to patients with hepatic derangement, and quotes two cases on record in which jaundice has been followed by fatal results (Glasgow Med. Journ., vol. 43, p. 395, after Am. Med. Surg. Bull).

TURPENTINE IN PERSISTENT HICCough.—Dr. Widmer Ralph has found the administration of a dose of 20 drops of turpentine successful in stopping an attack which had lasted nearly two days (Lancet, May 4, 1885).

SULPHIDE OF CALCIUM AS A PROPHYLACTIC OF INFLUENZA.—Dr. Green recommends a daily dose of one grain of sulphide of calcium in pill form. This treatment was tried successfully on the employees of two railways in the Isle of Wight, as well as in private cases as far as could be determined, and no case of influenza occurred when the pills were taken regularly (Brit. Med. Journ., May 4, 1885).

ERUPTION AFTER ANTIHYDRIN.—Dr. Gaston, at a meeting of the Société Française de Dermatologie, showed a patient who, one hour after taking a gramme of this antihydrin, experienced a sudden tingling all over his body covered with large patches, some violet and livid, others pigmented and brownish, those at the angles of the mouth and on the lips resembling a false membranous stomatitis (Med. Press, May 5, 1885).

TREATMENT OF INFLUENZA.—Unless contrab indicated by such states as old age, vascular derangement, etc., antipyrin still remains one of the most pleasant and rapid remedies for relief of the symptoms of influenza. It should not be given in too large doses at too long intervals. By using the following formula, relief is speedily secured and depressing effects avoided:—Antipyrin, 5 grains; bicarbonate of soda, 5 grains; sal volatile, 10 minims; tincture of opium, 2 minims; dill water to half an ounce. One such dose every half an hour for three doses, then every two hours, every three hours, and afterwards every hour if needed. The combination of a small dose of landanum appears to prevent nervous prostration. The headache of influenza can be generally best relieved by phenechus thus combined:—phenechus, 5 grains; granular effervescent hydrobromate of caffeine to 2 drachms. To be taken in a wineglass of water, and repeated every two hours for three doses unless relieved (Practitioner, April 1893).

NAPHTHALIN IN TREATMENT OF OXYURIDES IN CHILDREN.—Prof. Unningar, after thoroughly clearing the bowels by means of a mild purgative, gives naphthalin in doses of 15 centigrammes for a child of one or two years old, up to 40 centigrammes for two or three years, this dose being repeated twice daily for two days. Then a pause of eight days is made, and if necessary, the course repeated. The naphthalin may be given in cachets or in powdered sugar. Fat should be avoided in the diet, as it favours the absorption of the drug. It is asserted that naphthalin given in this way is less dangerous than santoin (Intern. Med. Mec. after Therap. Wochehiich., Feb., 1885).
Notes and Queries.

The information given in this column includes notes of practical interest to pharmacists, and replies to queries which seem to possess sufficient interest to readers generally.

SANDAL-WOOD OIL IN PILLS.

[860.] M. Calmel (Rer. pharm. des Flandres) mixes sandal-wood oil, 5 Gm., with calcined magnesia, 0·5 Gm., and then adds the mixture to colophony, 4 Gm., which has been melted at a gentle heat. The mass is said to be easily rolled and cut into pills after cooling.

ADULTERATION OF CATECHU (GUTCH).

[861.] According to Gehe and Co., adulterations of catechu in the countries where it is produced are largely practised, the chief material used being decoctions of the bark or wood of other trees; the following species are said to be employed for this purpose: "Man" (Terminalia oliveiri), "Tank-kyan" (Terminalia tomontosa), "Leen" (Terminalia bialata), "Hpaongh" (Terminalia chebula), and in a lesser degree other species (Pharm. Centrale, April 25, 1885).

ACID CEMENT.

[862.] The following preparation is recommended for cementing glass, porcelain, or other vessels intended to hold corrosive acids:

- Asbestos.
- Barium sulphate.
- Silicate of sodium.

2 parts.
3 "
2 "

By mixing these ingredients a cement strong enough to resist the strongest nitric acid will be obtained. If hot acids are dealt with, the following mixture will be found to possess still more resistant powers:

- Silicate of soda (50° Baumé).
- Fine sand.
- Asbestos powder.

2 parts.
1 part.
1 "

Both these cements take a few hours to set. If the cement is wanted to set at once, use silicate of potash instead of silicate of soda, and it will be instantly effective, and possesses the same power of resistance as the other (Journal de Pharm.).

SEPARATION OF SALICYLIC ACID FROM WINE.

[863.] Claassen first renders the wine markedly acid with sulphuric acid, then shakes out the salicylic acid with a mixture of ether and light petroleum ether of specific gravity 0·87). The salicylic acid is obtained in this manner directly in so pure a state that the farric chloride reaction can be applied at once to the etheral extract. Separation of the etheral fluid takes place readily, far more rapidly than when pure ether or chloroform are employed. It is better to treat the uncondensed wine direct by this method, since the etheral solvent separates more readily from a dilute than from a denser vinous solution (Pharm. Rundsch, Feb., p. 38).

EMULSION OF CASTOR OIL.

[864.] The following has been suggested as an emulsion of castor oil, which might be added to the Pharmacopoeia. Castor oil, 1 oz.; gum acacia, 4 drachms; elixir saccharin, 20 minims; essential oil almonds, 2 minims; oil of caraway, 2 minims; distilled water to 2 fluid ounces. Dissolve the gum in the water, add the oil gradually, and lastly the flavouring (flavonatum).

The method here directed is scarcely that which should be followed. A little of the oil should be added first to the gum in a dry mortar; then water, a little; followed by the rest of oil; lastly remaining water.—Ed. Ph. J.

CLEANING NICKEL-PLATED SURGICAL INSTRUMENTS.

[865.] Lay the instruments for a few seconds in a bath of 1 part of sulphuric acid and 50 parts of alcohol. Then wash them with water, rinse with alcohol and dry with a linen rag. This process cleans nickel perfectly, the yellowest and brownest articles being restored to brightness by leaving them in the acid solution for fifteen seconds (Journ. Brit. Dent. Assoc, after Literary Digest).

CAOUTCHOUC CEMENT FOR INDIA-RUBBER SHOES.

[866.] No. 1, caoutchouc, 10 parts; chloroform, 280 parts. No. 2, caoutchouc, 10 parts; brown resin, 6 parts; thus, 2 parts; oil of turpentine, 40 parts. Solution No. 1 is produced by simply leaving the caoutchouc standing in a bottle with the chloroform. For solution No. 2 melt the finely cut caoutchouc and the resin, add the turpentine, and dissolve the whole in the oil of turpentine. Mix both solutions (Zeitschrift, xlix., 249).

CAOUTCHOUC CEMENT FOR CYCLE TIRES.

[867.] Bisulphide of carbon, 160 parts; gutta-percha, 20 parts; caoutchouc, 40 parts; isinglass, 10 parts. This cement is dropped into the crevices after they have been properly cleaned. If the rent is very big, apply the cement in layers. Bind up the rubber tyre lightly with thread, let dry for twenty-four to thirty-six hours, cut off the thread, and remove the protruding cement with a sharp knife, which must previously have been dipped in water (Zeitschrift, xlii., 249).

REMOVAL OF IRON MOUNT FROM LINEN.

[868.] A. Schneider (Pharm. Centralbl.) recommends the following two processes after extended experiments. The first is preferable. 1. The spots must be rubbed while the clothes are still wet with an aqueous solution of tannin, 1 in 20, then put aside for six hours. Then rinse the clothes wash thoroughly with soap, and rinse again in clear water. Rub the spots with an aqueous solution of oxalic acid 1 in 20, and set aside for six hours. Last of all wash off the superficial oxalic acid with clean water. 2. Rub the spots, after soaking, with a 1 per cent. aqueous solution of sulphide of lime, put aside for six hours. Run clean water on the spots, wash with soap, again run on clean water. The spots will now have turned black; then rub with diluted acetic acid by force, and finally rinse out in clean water (Zeitschrift, xlii., p. 240).

DEPILATORY COLLODION.

[869.]—

Iodine
Oil of turpentine
Castor oil
Alcohol
Collodion

75 centigrammes
20 drops
2 grammes
10 "
30 "

To be applied once daily for three or four days. When the colloid is removed, the surface beneath is rendered free from hair (Bull. de Pharm. de Lyon, after Jour. de Pharm. May 1, 1895).

LOTION FOR CHAPPED HANDS.

[870] Chapped hands, fissured lips, and analogous effusions are benefited by the following lotion:—Compound tincture of benzoin, 10 minims; rectified spirit, 2 drachms; rose water, 30 minims; glycerin, 1 fluid ounce. To be applied to the chapped surfaces after washing with soap and warm water and thoroughly drying (Therapeut. Gas. [3], xix., p. 271).

FERROFYLIN AND FERRYPHYN.

[871.] It would appear that the same substance has been described under these different names. It would therefore be preferable to limit the nomenclature to ferrypyrin (Therap. Monats.).
Communications for the Current Week's Journal should reach the Office, 11, Bloomsbury Square, London, W.C., addressed to "EDITOR," not later than the first post on Wednesday. Telegrams can be received at Thursday Morning. Telegraphic Address—"Pharmaceutical Journal, London." Advertising (except for the "Exchange" columns), orders for copies of the Journal, and instructions from Subscribers regarding the sending of copies of same, must not be addressed to the Editor, or delay will be caused. See directions on Editorial page.

Correspondents who wish notice to be taken of their communications must write in ink on one side of the paper only, and should authenticate the matter sent with their names—of course not necessarily for publication. No notice can be taken of anonymous communications.

Drawings for illustrations should be done with pen and ink (Chinese), and consist of clean, sharp lines, without shading. They should also be sent twice the desired size, so as to allow for reduction.

Names and formulae should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

*Correspondence should be addressed "Editor," and will be replied to as early as possible after receipt, answers of sufficient general interest being given under the heading Notes and Queries.*

LETTERS.

The Preliminary Examination.

An Associate, who veils his identity under the nom-de-plume of "Excelsior," writes as follows:—I read with much pleasure the letter of your correspondent, Mr. A. Campbell Stark, in your issue of last week, and I cordially agree with his remarks all through. It does certainly seem to me to be commencing at the wrong end to teach chemistry and physics to students who do not know how to think algebraically. I used to be much surprised, when studying for the Minor, to find that my tutor, himself an M.P.S., never worked any of his problems by algebra, in fact, algebra was never mentioned either by him or by my fellow-students, and such a thing might not have existed. When up for the Minor, too, I noticed that candidate did not seem to grasp the bearing of questions on theory which would not have presented any difficulty if algebra had been part of their mental training, and it seems to me that students would be better able to assimilate the technical information laid before them by their tutors if this were the case; in other words, the knowledge would be taken in easier and would come out easier. The raising of the standard of the Preliminary would also lessen the immense gap—which at present exists between that and the Minor—and the student who has the brains to compass a Preliminary equivalent to that required by the Medical Council will not consider the Minor such a terrible bogey when he comes to it. I think, with your correspondent, that the Pharmaceutical Council ought to take the matter up now, and adopt the same line of Preliminary examinations as that accepted by the Medical Council for registration as medical student, and I do not see why this should be thought too severe a test.

C. A. T., Dumfarton, also refers to this subject, and says, if one, would like to ask what is the aim of the Science students to poor such an examination? I think the subjects useless in the extreme, and would suggest that a student who holds a certificate of having passed the sixth or ex-sixth standard of our modern schools, and has an intention of being chemist, could have that accepted for the Preliminary, and that an examination in the shape of a little practical dispensing, pharmacy, chemistry, etc., be passed before the age of twenty-one years, and the present Minor examination in the usual way. The existing gap between the Preliminary and the Minor would thus be lessened. Of course, Mr. Stark’s method might suit a few who realise that it has been a good job for them that their fathers were born before them, but the poor fellows who (like the poor) are born not made druggists would be simply out of it.

ANSWERS.

"Pharmako."—Your inquiry should have been addressed to the "Editor." The inflorescence is from the plant Aconitum, (P. G., Rem. 2, 3). The formations on the leaves are galls caused by the activity of some insect. Possibly we may be able to ascertain what the insect is and inform you later.

HUMILIS.—The specimens sent are from Rhus coriaria, the leaves of which, when dried and powdered, furnish uannah.

John H. Smith.—The account sent does not possess sufficient general interest to merit publication.

J. D. Rose.—You will observe that the conditions are now altered.

J. B. Hill.—Many thanks for enclosures.

"Demosgenes."—Compressed sulphurised hydrogen is supplied in cylinders by Baird and Talbot, Cross Street, Hatton Garden, E.C.

J. F. J. Rodger.—What you require is probably tinct. cupri acet. (Rademacher). To prepare this, boil together copper sulphate, 50 g., scrapings of natron, 50 g., and distilled water, 5100 g. Subsequently add to the decanted and cooled liquid, spirit of wine, 3000 g. See Hager’s ‘Handbuch der pharmazeutischen Praxis’ for further details.

Communications, Letters, Etc., have also been received from Messrs. Cracknell, Ewell, Greenish, Jesper, Nightingale, Prior, Rebman, Redhead, Shepperson, Sleath, Smith, and Umney.

The publication of several reports is unavoidably deferred until next week.

Publications Received.

[Publishers are requested to state the price of books sent for review.]

FALLOWFIELD’S PHOTOGRAPHIC ANNUAL 1895-6. Pp. 780. Price 1s. 6d. post free. (Jonathan Fallowfield, 148, Charing Cross Road, W.) From the Publisher.

REPORT OF THE PHARMACIST BOARD OF VICTORIA FOR 1894. Pp. 10. From the Secretary and Registrar.

BULLETIN VAN HET KOLONIAAL MUSEUM TB HAARLEM FOR MARCH, 1896. Pp. 28, with four illustrations. (J. H. de Bussy, Amsterdam.) From the Kolonial Museum, Haarlem.

"THE MONTH."

Acotine. Following up the conclusion that this alkaloid is constitutionally an acetylated benzocaine, Dunstan and Carr have endeavoured to prepare it synthetically by acetylated benzocaine. Various experiments made with that object have furnished diacetyl, triacetyl, and tetracetyl derivatives, but the monacetyl derivative expected to correspond with acotine could not be obtained. The products obtained by acetylation benzocaine are described as being apparently non-toxic, and in the respect differs from acetylated derivatives of acotine. In reply to the letter by Freund, published in the March number of the Berichte (Ph. J., ante, p. 773), the authors state that the last of their three papers published in the Journal of the Chemical Society, for March, 1894, was not presented to the Chemical Society at the same time, January 18, 1894, as the other two, because the quantitative determination of the acetic acid produced in the conversion of acotine into isacotine (benzocaine) had not been made when the last was read. For the same reason, the formula representing isacotine to be an isomer of acotine was retained in the first of the papers published in that number of the Journal of the Chemical Society. The statement of the quantitative determination of acetic acid, which was subsequently included in the third paper by direction of the President of the Chemical Society, while the Journal was passing through the press, is also stated to be the only complete proof which has hitherto been adduced that acotine is acetylbenczocaine. In regard to the empirical formula for acotine and its derivatives suggested by Freund as being more consistent with his analytical data, the authors prefer to adhere to the formulæ they have hitherto adopted (Journ. Chem. Soc., lxvii., 459).

O. Tanet describes some interesting molecular modifications of glucose, which he has obtained artificially. Glucose α, the ordinary glucose, when crystallised, has a rotatory power [α]D = + 106°; whilst in the case of glucose β, formed when an aqueous solution of glucose α is boiled for a few minutes, [α]D = + 170°-175°. Sugar for glucose γ, produced in small quantities when amorphous glucose is heated for some time at 100°-110° = [α]D = + 22°-50. The aqueous solution of glucose α also yields glucose β if heated for seven or eight hours at 15°, or for thirty hours at 0°, and instantly in the cold on the addition of 1/100 of potash. In alcoholic solutions the transformation is less rapid and less complete. The three forms of glucose are all crystalline, and the cryoscopic method proves them to have the same molecular weight. Glucose γ in aqueous solution is completely transformed into glucose β, under the same conditions as glucose α, the rotatory power rising to [α]D = + 59°-5 as rapidly in one case as in the other. The action in alcohol is also the same in both cases (Comp. rend., cxx., 1060).

Cedanite. O. Helm expresses the conviction that the cedanite in which E. Aweng found succinic acid was in reality not true cedanite, but a well-known variety of succiunite. True cedanite is, according to Helm, free from succinic acid (Archiv., ccxxiii., 191).

Argon in Minerals. Professor Hodgkinson has obtained from euxonite and samarskite, when heated, twelve times their volumes of gas, the colour and spectrum of which when it was sparked, pointed to the presence of a hydrocarbon. On adding oxygen and exploiting, a decided contraction was observed, which was greatly increased on introducing potash. The spectrum was no longer like that of a hydrocarbon after absorption of the excess of oxygen, but had a close resemblance to that of argon (Chem. News, lixxi., 245).

Methylyamine Hydrochloride. A simple method for obtaining benzocaine from methylamine hydrochloride in a pure state has just been described by Brochet and Cambier. The principle of the method depends upon the interaction of formaldehyde and ammonium chloride. About 2 kilogrammes of commercial formaldehyde (40 per cent.) is mixed with 1 kilogramme of ammonium chloride in a flask of about 3 litres capacity. Vigorous action takes place, and when completed the liquid is distilled, when a large quantity of methyl [H·CH(OCH_3)₂] is produced, by condensation of the formaldehyde with the methyl alcohol obtained as the solvent, distill over. The residue is then further concentrated by evaporation until the ammonium chloride in excess just begins to separate. The liquid is next cooled, and the ammonium chloride separated by filtration; the filtrate is a solution of almost pure methylyamine hydrochloride, which is separated by evaporation of the filtrate in vacuo and subsequent purification by repeated crystallisation from absolute alcohol. When excess of formaldehyde is employed a certain amount of trimethylamine hydrochloride is formed, but only traces are obtained by the above method, using excess of ammonium chloride. The method gives very good results, since from 2 kilogrammes of commercial formaldehyde, containing about 40 per cent. of real formaldehyde, 850 grammes of methylamine hydrochloride (about 95 per cent.) was obtained by the first crystallisation. It is thus easy to prepare 1 or 2 kilogrammes of pure methylamine hydrochloride in the course of a day or two (Bull. Chim. Soc. Paris, [3], xiii., 533).

Sugar and Alcohol from Peat. Verveug obtained sugar and alcohol from peat by putting for 24 hours an equal quantity of peat and 3 per cent. sulphuric acid under steam pressure of nearly two atmospheres. The resulting black, turbid liquid is then saturated with calcium carbonate, filtered, and decolourised with animal charcoal. Part of the sugar obtained is converted into caramel, the rest fermented with water and yeast at a suitable temperature, and the alcohol obtained by distillation is rectified. The author considers that 1000 kilogrammes dry peat will furnish at least 60 litres pure alcohol. The sugar obtained from peat will doubtless never be of any value except as a source for preparing alcohol (Pharm. Cent., xxxvi., 290).

Chemistry of the Thyroid Gland. C. Scherenges, in a preliminary communication, states his conviction from experiments made, that the thyroid gland contains a considerable proportion of lecithin, the presence of which he regards as having an important relation to the physiological action of the gland (Pharm. Zeit., xi., 314).
Heliocon.
J. Juresca has prepared and examined a bismuth pyrogallate containing 57 per cent of bismuth, and protests against the name heliocon (Pharm. Post, xxviii., 169).

Methyl Salicylate.
H. T. Thater prepared an artificial winter-green oil by taking salicylic acid, 505.45 Gm., and methyl alcohol, 690.85 Gm. The acid is added in small portions to the alcohol contained in a wide-mouthed flask until a saturated solution is obtained. This is next heated to boiling point on a water-bath, the flask being connected with an upright condenser. Dry hydrochloric acid gas is then passed through the hot solution until saturated, the flask disconnected, 10 grammes of salicylic acid added, the flask replaced, and the solution again saturated with hydrochloric acid gas. The additions of salicylic and hydrochloric acids are repeated in the same way until all of the former has been added, and the passage of hydrochloric acid gas is then continued for about two hours. The upper of the two layers of liquid in the flask is then decanted, and the dark brown oily liquid remaining washed with water until no longer acid to litmus paper. Next, distil it from a flask with the aid of steam, separate the oil from excess of water by means of a separating funnel, and completely dry by the use of anhydrous calcium chloride. The process is described as practical and economical, and yielding an oil of great quality. With the quantities mentioned the yield is above 500 Gm. of a colourless or slightly yellowish oil of agreeable odour which improves on keeping, e.g. 187, and b.p. 221° C. Ethyl salicylate of a good quality can be prepared by the same process (Am. Journ. Pharm., lvii., 243).

E. Gilson has been able to prepare pure chitin from the tissues of certain fungi, Agaricus campestris being mainly experimented upon. The fungi in small pieces were treated successively with dilute caustic soda solution, boiling dilute sulphuric acid, alcohol, and ether. The residue after this treatment was white, and on drying became hard, compact, and horny. It possessed all the properties of chitin, being insoluble in all solvents except strong acids. Treated with warm, concentrated hydrochloric acid it furnished numerous crystals of glycosamine hydrochloride, and heated to 180° with caustic potash it yielded mycosin. Chitin has been prepared chitin from Ammonia marina, Cantharillus carabina, Hypholoma fasciata, Polyergus officinalis, P. fuscum, Russula, Boletus, Tricholoma, Bovista, and Claviceps purpurea. It appears to serve the same purpose in the cellular membrane of fungi that cellulose does in that of phanerogams (Comp. rend., x., 1000).

Toxicity of Aconitine.
At a recent meeting of the Société de thérapeutique, M. Mouquet stated that a horse weighing about 400 kilos, died some thirty-five minutes after the subcutaneous injection of 10 Min. of aconitine nitrate (Rap. de Pharm. [3], vii. 180).

Rhus Toxicodendron.
Pfaiff and Orr find Maish's toxicodendric acid to be inactive, and ascribe the poisonous properties of Rhus toxicodendron to a principle resembling, but not identical with, cardol (Pharm. Zeitung, xl., 339).

Disinfection by Formaldehyde Vapour.
Gambier and Brochet publish in the Revue d'Hygienne a suggestive paper on the value of formaldehyde vapour for destroying all dust germs, even anthrax bacillus and its spores, provided that the room be hermetically sealed and the exposure is sufficiently prolonged. Moulds and nonpathogenic forms of bacilli are most resistant, but those causing putrefaction quickly succumb. The penetrating power of the gas was shown in the complete sterilisation in twenty hours of dust placed in beakers to the depth of a centimetre, the beakers being placed in a cupboard. Formaldehyde disinfection would be valuable in the case of breakable or precious objects; it has the great advantage over corrosive sublimate spray that it is not necessary to displace the majority of articles.

Any germs that escape a first operation are destroyed by a second.

Localization of Brucine and Strychnine.
Sauvan states, as the results of some preliminary micro-chemical tests on the seeds of Strychnos nux vomiaca and S. gaultheriana, that these alkaloids of nux vomica are found solely in the cells of the albumin and of the embryo, and not in the seed coats. Further, the reactions for strychnine and brucine do not take place in the same cell, so that it would appear that the alkaloids exist separately in adjoining anatomical elements. The author promises to continue his researches in this direction (Journal de Pharm. [6], i, 497).

Alkaloids of Berberis.
H. Pommersheine ascribes to oxyxanthine the formula C_{6}H_{9}NO_{4}; it is to be regarded as a tertiary base, and is strongly dextro-rotatory. The formula of berberine he finds to be C_{36}H_{33}NO_{5}. From berberine he has prepared a neutral sulphate, a true bicarbonate, and a well-defined hydroxydine (Archiv., ccxxxii., 173).

Methyl Salicylate.
M. P. Romburgh has detected methyl-salicylate in the distillate from coca leaves. It appears to exist as a free ester. Leaves pre-formed in the leaves, but only in very small quantity, very little bromine being consumed in Erythroxylon betulinum to 0.13 in very young leaves (Rec. des trav. chim. through Chemiker Zeitschrift, x., 130).

Rhubarb.
R. Otto has examined the petioles of several varieties of rhubarb in common use for culinary purposes, and finds that, in addition to considerable quantities of insoluble calcium oxalate, they contain as much as 2 to 3 per cent. of oxalic acid either in the free state or as a water-soluble oxalate. Otto considers that the continued use of these petioles as a vegetable must be injurious to health (Landw. Jahrh., 1886, through Apoth. Zeitung, x, 354).

American Storax.
K. Molhr describes, as an eye-witness, the collection of American storax from the sweet gum trees (Liquidambar styraciflua) in Mississippi State. The trees are completely ringed by a cut penetrating deep into the sap wood; the resin exudes from the wood and hardens to clear colourless drops. Occasionally cavities filled with resin are formed in the bark. The resin is used as a chewing gum and also as catarrh (Ph. Rundsch., through Pharm. Zeitung, xl., 338).
A new adulteration of senega root has been found to have been practised by an American firm by mixing the roots of Triosteum perfoliatum, Linn., *N. O. Capsafoliaceae*, with the genuine article to the extent of 25 per cent. It is interesting to note that the same root is also used as a substitute for ipecacuanha. The genus Triosteum comprises five species. *Triosteum perfoliatum* is most frequently found in the eastern parts of the United States. The thick knobby rhizomes act as a purgative, and in larger doses as an emetic. In Georgia the rhizome is used for rheumatism; the hard seeds are supposed to furnish a substitute for coffee. The drug was formerly official in North America. It is yellow to dark brown in colour, of peculiar shape, about 9 cm. long, and shows traces of the seminal stems on top. The rootlets projecting from the main root are as a rule 0.5 cm. thick, but sometimes grow as thick as 1.2 cm. They are on the whole very similar to senega, but they do not possess the characteristic keel of true senega root; therefore on careful inspection the difference is evident (Pharm. Cent., xxxvi, 280).

Boormara finds the bark of *Plumeria acutifolia* to contain a crystalline non-poisonous principle, plumerid; boiled with dilute hydrochloric acid the solution of this body assumes first a yellow, then a red colour, finally producing a brown precipitate without the formation of any sugar. The bark of *Scorola kinigi* also contains an indifferent bitter principle apparently devoid of toxic action. The seeds of *Eugenia horsfieldii* contain a toxic, those of *Sterculia javanica* a non-toxic alkaloid. From the leaves of *Jasminium gracilisculum*, Boormara isolated a brownish-yellow amorphous bitter principle. The tubers of * Dioscorea hirtula* are used in Java as a food-stuff. For this purpose it is necessary to cut them in thin slices and expose them for twenty-four hours to a stream of running water to free them from their poisonous properties. Boormara has extracted from the tubers two uncrystallisable alkaloids, which he has named dioscorine and dioscerine; both are poisonous, the former being the more active (Pharm. Zeitung, xi, 339).

L. F. Kebler has examined three purchased samples of the preparation sold under this name in the United States, with the following analytical results:—

1. Sulphur, 81.58 per cent.; antimonious sulphide, 12.68; sand and earthy matter, 5.74.
2. Ground limestone, 55.00 per cent.; coal-dust, 47.00.

This preparation, according to A. Sapin, ought to be kept exposed freely to light rather than in the dark, and the stock renewed every month, only a small quantity being made at one time. Prepared according to the Belgian Pharmacopoeia, the tincture contains 76.49 per cent. of pure iodine, and of two specimens prepared at the same time, the one exposed to light contained 63.91 per cent. at the end of a year, while the other kept in the dark contained 63.48 per cent. only. The explanation of these facts would seem to be that the hydriodic acid and ethyl iodide, formed by the action of the iodine upon alcohol, are readily decomposed by light, and the iodine is thus liberated again. The influence of temperature in diminishing the proportions of free iodine seems to be less than would naturally be imagined. Pure or re-distilled alcohol that has been already used for some preparation causes the free iodine to disappear more rapidly, by reason of organic matters present which rapidly combine with it. Freshly-prepared tincture of iodine, if it is, of course, will not froth appreciably when agitated, but in proportion to the age of the preparation and the alteration that has taken place the froth formed is abundant (Rev. pharm. des Fländres, through Répertoire [3], vii, 197).

A. L. Lumière point out that the indirect method of photographing in natural colours has not received a proper practical application because of the difficulty experienced in selecting the colours and in preparing and superposing the monochromes. They recommend the use of orange, green, and violet screens for preparing three series of negatives presenting a maximum of sensibility to the rays which the respective screens allow to pass. Specimens of photographs so prepared were exhibited before the Paris Academy of Sciences. The printing and superposition of the monochromes have been successfully accomplished by employing bichromated gelatin, to which are added substances insoluble under certain conditions. If, for example, 5 per cent. of ammonium bichromate is added to 5 to 10 per cent. of silver bromide in the form of emulsion be added to a 10 per cent. solution of gelatin, and the preparation be spread in a thin layer upon a plate of glass, a surface is obtained which can be exposed under a negative and will reproduce the picture by the action of light. After exposure the plate is washed with cold water, and the portion of the film acted upon by light, being rendered insoluble, remains and serves to print the image from on the application of suitable colours. The silver bromide, dried by the way, may be replaced by other insoluble precipitates, is easily removed by the action of sodium hypo-sulphite, and proofs can then be printed from the plate in any colour, showing all the gradations of tint present in the negative. Polychrome prints may be obtained by receiving on the same plate monochrome red, yellow, and blue images successively, by means of three corresponding negatives, and isolating each image from the preceding one by an impervious layer of collodion. By employing dyes of greater or less concentration one by simple decoration with water, variation in the relative intensity of the monochromes is readily obtained (Comp. rend., xxvii, 875).

According to Buwa, an extremely useful and simple pill counter can be obtained by making a shallow tray in the shape of an isosceles triangle. If the pills are thrown into the tray and shaken to the apex the first row (in the apex) will contain one pill, the second two, the third three, and so on. The number of pills on the tray can therefore be easily ascertained by examining the rows and referring to a previously calculated table (Pharm. Post, xlvii, 227).
Panification of Brown Bread. According to J. Chappuis, brown bread is the result of the action of a ferment, cereal, found in the endosperm of wheat, upon starch paste. This induces lactose and glucose fermentation, and in the oven transforms starch into dextrin and glucose, whilst the gluten is also altered, the bread produced being acid, brown, and pasty. Chappuis has observed that hydrogen peroxide, which is without action upon the epicarp and endocarp of wheat, is quickly decomposed by the embryo and endosperm, and that the latter then loses the property of converting starch into dextrin. He also notes that cerealin extracted from bran by water liquefies starch normally, but not after treatment with hydrogen peroxide. The ferment being destroyed, therefore, by hydrogen peroxide, addition of the latter to inferior flour results, in the case of unleavened bread, in the production of white bread, equal in appearance to that obtained from the best flour, instead of brown. Since yeast is killed by the peroxide, fermentation is impossible whilst the latter is present; but as soon as the excess is dissipated the dough becomes capable of rising under normal conditions. It is stated, in conclusion, that wheat soaked in hydrogen peroxide solution will not germinate (Comp. rend., xx., 933). In another paper upon the same subject L. Boutroux states that the cause of the brown colour may be the dying of the gluten, or the action of atmospheric oxygen upon the bran in the presence of water, but in neither case is it due to fermentation, whilst the acidity of the leaven is actually a protection against browning (Comp. rend., xx., 934).

New Indiarubber Cork. A French firm has recently introduced a new form of indiarubber cork. The rubber is hollow and at one and a hard disc is attached, through a perforation in which a rod passes to the bottom of the cork. On pressing the rod the stopper elongates, and can be introduced into the neck of the bottle, on releasing the pressure the stopper contracts in length, but increases in diameter, and will be firmly held by the neck, of which course should be slightly smaller than the cork (Apoteker Zeitg., x., 332).

J. H. Baldock, in a discussion on the use of starch as a mountant, pointed out that the starch must be brought into a state of disintegration, not solution, the usual plan being to make it into a cream with cold water, and then, while constantly stirring, pour on boiling water until thickening takes place. More completedisintegration is obtained, however, by subsequently boiling for a few minutes, whilst a clearer jelly is obtained, and better keeping properties are secured. The paste should not be too thick, and if not made fresh at the time of using, should be boiled well, and have a little boric or salicylic acid or oil of cloves added as a preservative. Alum is objectionable in starch paste for photographic purposes. H. D. Gower said he prepared a paste that kept well by adding an ounce of starch to half a pint of water and heating, with constant stirring, until thickening occurred. Heat for a few minutes longer, remove from the source of heat, add half an ounce of glycerin and, when nearly cold, half an ounce of methylated spirit. A few drops of oil of cloves or other essential oil may be added if desired, but this is not necessary (Photography, 1895, p. 210).

Calcium Permanganate Purifying Water. Bordas and Girard suggest the employment of calcium permanganate for the purification of drinking water, since the use of this foreign soluble salt, as when the permanganates of sodium or potassium are employed. To remove an excess of calcium permanganate, the lower oxides of manganese are used, which reduce the permanganate to the insoluble binoxide. Water thus treated contains neither dead organic matter nor living organisms; but contains a little calcium carbonate and minute traces of peroxide of hydrogen, which tend to assure the asepsia of the fluid (Comp. rend., xx., 889).

To determine the relative volume of powdered preparations, take a small round measure of about 2 decimetres in height and 14 centimetre in diameter, which must be graduated from the bottom upwards in cubic centimetres; put a small amount of powder into the vessel by means of a funnel made of black glazed paper, and tap the measure against a rigid surface until after one to two minutes the volume of the powder does not diminish. Powderes which have become aggregated must of course be re-powdered; if the number of the observed cubic centimetres is divided by the weight in grammes of the powder taken, a number is obtained which Glöckmann (Zeitschr. d. Osterr. Apoth. Ver., 1896, 214) terms the relative volume. By means of this volumetric method, the approximate nature of certain preparations can be indicated (Phar. Cent., xxxvi., 279).

Lysolium Bohemium. Under this name a new preparation of tar has been brought into the market by a firm in Bohemia; it is a dark brown liquid of agreeable odour, and will mix in any proportion with ordinary or distilled water. The solution is permanently clear, and of a yellow colour, which darkens after a time without the liquid becoming turbid. The solution does not affect the hands, instruments, clothing, etc. To disinfect wounds a 1 to 2 per cent. solution is used; for disinfecting instruments a solution of 0.2 per cent. will be found sufficient (Pharm. Cent., xxxvi., 380).

Loaded Sponges. According to the Oil, Paint and Drug Reporter the rise in price in the various kinds of Florida sponges has given rise to an ingenious method of artificial weighting. Formerly lime and sand were employed for this purpose; now it is stated glycerin and solution of silicate of sodium are used, the latter being selected for its admirable weighting properties and the ease with which it can be manipulated. One sample when tested showed a loading of about 26 per cent. of this substance.

Agar-Agar in Glycerin Suppositories. Lomuller uses agar-agar (Gelidium corneum) instead of gelatin to make glycerin suppositories. It produces a more transparent mass which does not stick to the mould, does not clot, and gives a more elegant article when finished. The method employed is as follows:—Take 10 parts of agar-agar in small pieces and 200 parts of water, heat until a soft paste is formed, then add with constant stirring 200 parts of glycerin (L'Union Pharmaceut., xxxvi., 197).
NOTES ON THE ASSAY OF IPECACUANHA.

BY R. A. CRIPPS, F.I.C.

The rapidly approaching revision of the B.P. renders opportune any contribution to the subject of standardisation, especially of such important drugs as ipecacuanha.

It is necessary to determine:—1. The principle or principles to be determined. 2. The process of assay. 3. The standard to be adopted.

I desire to offer some remarks upon each of these points as applied to ipecacuanha.

1.—The Principle or Principles to be Determined.

The researches of Paul and Cowenley have considerably increased our knowledge of the alkaloids of ipecacuanha; they have isolated three, emetine, cephaeline, and another. The alkaloidal substance described by Whitty and myself in a paper read before the British Pharmaceutical Conference in 1891 ('Year-Book,' 1891, p. 385), would seem to correspond with a mixture of the first two. Indications of the presence of another crystalline alkaloid were obtained and mentioned in the same paper. In addition to these there is also present a fourth alkaloid not removable from ipecac by rectified spirit, unless previously set free from its natural combination by means of an alkali; it may, however, be readily extracted by water or dilute acid (see 'Year-Book' 1891, p. 392; also Braithwaite and Umney 'Year-Book,' 1889, p. 390).

I have been unable to confirm Arndt's statement that ipecacuanha contains a volatile alkaloid, although I have specially sought for it in two distinct samples. The relative proportions in which these alkaloids are present have not been thoroughly determined; it is probable that ipecacuanha, in common with other drugs, containing several alkaloids, contains them in widely divergent quantities. I have myself proved that the proportion of the third alkaloid, to the combined emetine and cephaeline, may vary from one-twentieth to nearly one-fourth. However, it seems to be generally admitted that the amorphous ether-soluble alkaloid (emetine) is the most important. Paul and Cowenley state that cephaeline acts as an emetic, whilst the action of the other two has not been made known. Under these circumstances it seems to me that we cannot do more than adopt as standard of total alkaloids; later on, when, perhaps, our knowledge will be more precise, it will be easy to improve by adopting an assay of one or more to the exclusion of the others.

2.—The Process of Assay.

In conjunction with A. Whitty I published a paper in the Ph. J. [3], vol. ix., p. 721, in which the results of many assays were included, and we there expressed the opinion that the process of Lyons was the best published up till that time. We also described a similar process in which acetic ether was used for extraction of the alkaloids from the crude drug. Further experience of this latter process has not confirmed my good opinion of it, for I have at times met with samples of the root which have failed to yield the whole of the alkaloids to that solvent, either alone or acidulated. I have therefore been thrown back upon Lyons' process, which I have since compared with that of Keller ('Year-Book,' 1893, p. 122, and 1894, p. 128). In the three samples compared the results have been:—Lyons, 2.32, 2.60, and 2.16 per cent.; Keller's, 2.27, 2.32, and 2.10 per cent. Although

both methods have advantages, I prefer that of Lyons, exhaustion being carried out by percolation or maceration, and the alkaloids extracted by ether, followed by chloroform, the residue from the separation of which is washed.

Other methods have from time to time been published, but none seem to me so suitable as that of Lyons; many undoubtedly give low results.

3.—THE STANDARD TO BE ADOPTED.

Closely connected with this is the settlement of the variety or varieties of ipecacuanha which it is desirable to render official. The question is really whether the Carthagenan drug shall be admitted in addition to the Brazilian, the others being all very weak in alkaloids. Published statements vary as to the relative richness of these two kinds, but the preponderance of evidence is in favour of the latter being distinctly more powerful. In the table which follows I have given the results of several workers. Moreover, Paul and Cowley state that the Carthagenan drug contains a distinctly larger proportion of the crystalline base—cephaline—than the Brazilian, the stems of this latter being similarly rich in cephaline. As the object of all standardisation is the attainment of greater uniformity, I think it would be distinctly retrograde to introduce another certain source of variation by making both drugs official. If so there could be no valid objection to the recognition of an admixture of the stems of Brazilian ipecacuanha also.

Of these processes that employed by Lyons (Dragendorff’s) gives results which are rather high. Flickiger’s process, on the other hand, yields low results, whilst that of Cesar and Lorett appears to do the same to a far greater degree. However, taking the average results of each observer, the mean of all would be as follows:

Brazilian root, 2.26 per cent., or omitting Cesar and Lorett’s low figures, 2.15 per cent.

Brazilian stem, 1.35 per cent.

East Indian root, 1.57 per cent., or omitting Cesar and Lorett’s low figures, 1.92 per cent.

Carthagenan root, 1.34 per cent., or omitting Cesar and Lorett’s low figures, 2.00 per cent.

My own results of assay, using either Lyons’ process or the acetic ether method, have been as follows:

**Brazilian Root.**

</tbody>
</table>

Average of 61 samples = 2-24 per cent.

**Brazilian Stems.**

One sample yielded 1-70 per cent.

**Carthagenan Root.**

Five samples yielded from 1-96 to 2.12 per cent.; average = 1.81 per cent.

Adding these results to those quoted above, we obtain the following averages:

**Brazilian root average of at least 146 sps., 2-25 per cent.**

**Brazilian root (omitting Cesar and Lorett’s figures) of at least 143 sps., 2-34 per cent.**

**Carthagenan, average of at least 13 sps., 1.38 per cent.**

**Carthagenan root (omitting Cesar and Lorett’s figures) average of at least 10 sps., 1.90 per cent.**

Stem (Brazilian and E. I.) average of at least 7 sps., 1.42 per cent.

These results show the marked inferiority of the Carthagenan drug.

To sum up, I would suggest:

1. That the Brazilian root be alone official.

2. That the process of Lyons be officially recognised.

3. That ipecac be required to yield by this process not less than 2-0, nor more than 2-5 per cent. of alkaloids.

4. That the preparations of ipecac be made by the present official methods, except that in the case of the wine a weaker acid be used for extraction, and the dry extract be assayed and used in such proportion that the finished wine shall contain 0.1 per cent. of alkaloids.

It may be urged in objection to this third suggestion that so low a minimum as 2-0 per cent. leaves room for admixture of stems or Carthagenan root for the purpose of dilution. Personally, however, I would prefer an easily attainable "standard" such as this to one which would give so much trouble and cause the rejection of a considerable proportion of the genuine drug entering this country, as would be the case should a standard, e.g., of 2.2 to 2.7 per cent. be required. The best settlement of this point, however, would be for those who, like myself, have assayed considerable numbers of samples, to tabulate the results for publication, and at the same time detail the processes of assay used, so that comparison may be made by the editor of the new B.P.

---

**THE UPSAS TREE.**

Professor Wisner, during his recent stay in Java, ascertained some interesting particulars with reference to the celebrated Upsas tree, *Antiaris toxicaria*. Contrary to the general impression that this tree is not uncommon in Java and Sundas Islands, an impression manifested by the statements in the leading text-books, Professor Wisner learnt that the original specimen described by Leschenhauot has been felled, and in the whole of Java there were only three individual trees belonging to the genus *Antiaris* and closely allied to *A. toxicaria*. Of these three trees one was found by Dr. Gresaff to be innocuous, and was therefore *A. insensia*, Blume, a species supposed by many botanists to be only a variety of *A. toxicaria*. The second tree proved to be poisonous, one drop of the latex being sufficient to kill a dog; the third has not been examined.

The tree has, however, been cultivated in the botanical garden, and there are now in the plantation at Tjilimarang about seventy specimens.

Neither in the botanical garden nor in the plantation could any ill-effects be observed, even after having been for some time in the neighbourhood of the trees, and the accounts of the poisonous nature of the exhalations from it are much overstated. Dr. Burck has shown that the plant gives off no injurious vapours, and the latex is poisonous only when it comes through a wound into the blood. Material brought from Java by Professor Tichonrow has been examined by Gorodetskoff. The bundles in *Antiaris toxicaria* are bi-collateral; the laticiferous cells which do not anastomose with one another contain a granular, light brown, strongly refractive matter. The juice contains a glucoside antisorin, the best reaction of which was found to be the change of colour from yellow to orange-red, shown by boiling a solution with picrate of sodium (Pharm. Zeitsh., f. Osterr., xxxii., 313, and Pharm. Zeitsh., f. Russland, xxxvi., 248).
SOME MEDICINAL PRODUCTS FROM THE STRAITS SETTLEMENTS.

By E. M. Holmes, F.L.S.,
Curator of the Museum of the Pharmaceutical Society.

Nearly three years ago attention was directed in this Journal (vol. xxiii., p. 388-390) to several products possessing medicinal properties, and to others of possible use in the future, by reason of being very active agents. Several of these could not be botanically identified at the time, owing to the difficulty in obtaining flowering specimens of the plants yielding them. Mr. Leonard Wray, who sent the previous specimens, has now been able to obtain the plants in flower or fruit, and has sent other specimens, which seem of sufficient interest to be noticed here.

BISHA.—The leaves are stated to be used as a substitute for opium, and Mr. Wray believed them to be obtained from a Rubiaceous plant of the genus Nauclea (L. c., p. 390). The plant that he has now sent does belong to that natural order, but to the genus Mitragyna, and agrees well with the description of the plant published by Korthals in the Verh. Nat. Ges. Bot. (p. 160) under the name of Mitragyna speciosa. The plants of this genus have the flowers arranged in globose heads, each flower nesting in a circle of spatulate bracts. The most curious part of the flower is the stigma, which is mitre-shaped and ribbed longitudinally, and covers the top of the style like an extinguisher, but only the lower half is free from the style. The flowers are stated by Mr. Wray to be of a pale greenish-yellow colour, but in the dried state they are brown. Now that the origin of the drug is known, there should be no difficulty in procuring it in sufficient quantity to test its medicinal value.

BUAL.—The experiments made by Dr. Stockman (Ph. J. [3], vol. xxiv., p. 561), on the physiological action of the root of this plant, showed that it probably contains two active principles, one acting on the heart muscle, and the other on the terminations of the motor nerves as a paralyst. The imperfect specimens previously sent, consisting of leaves only, were doubtfully referred to at Kew (Kew Bulletin, Nov., 1891, and Ph. J. [3], xxiv., p. 582), to the Rubiaceous genera, Lasiathanus or Urophyllum. The specimens with fruit that have now been sent show that the plant evidently belongs to that natural order, but not to either of the genera named. The specimens now received have only immature fruits, but Mr. Wray informs me that he has sent three flowers of the plant to Kew, and I learn from Dr. Stapf that he has been able to identify the genus, and will shortly publish his identification of the species.

IPOH AKER.—Mr. Wray states that he has now obtained the fruit of this species of Strychnos, which was formerly considered at Kew to be a species of Strychnos closely allied to S. malayensis, but which seemed to me to approach more nearly to S. wallichiana. The material now received at Kew will therefore be probably sufficient for clearing up the exact species yielding this poison.

POISON ROOT, No. 4281.—Concerning the root sent under this number, Mr. Wray says: "The roots of this plant are used by the Malays for poisoning rats. It is pounded up and mixed with boiled rice, and is said to be very effective." The plant which Mr. Wray sends with the root proves to be Dianella nemorosa, Lam., a Liliaceae plant of wide distribution, extending from Madagascar and India and to Australia and the Pacific.

POKO LULAY.—Under this head Mr. Wray writes, "This is the Malayan varnish tree. The varnish is one of the very best there is. It is nearly white, very brilliant, and extremely hard. It is used for polishing the woodwork of weapons, such as the kris. The bark of the tree is cut and the sap caught as it runs out. The sap is then cooked in an iron pan to expel the water, and while hot is mixed with some drying oil or turpentine. The varnish so made is applied to the wood with a piece of rag. It takes from two to four days to dry. Specimens of the resin, or getah lalu, as collected by the Malays, and of the prepared varnish, as well as herbarium specimens of the plant in fruit, have been sent by Mr. Wray. The plant evidently belongs to the genus Garcinia, and is nearly allied to G. merymania, Wright, having elliptical lanceolate-acuminate leaves with a narrow obtuse apex. The leaves are coriaceous in texture, but thin, and the veins are not prominent on the upper surface, which is shining. The mirdrib is prominent on both sides, and the veins are slightly so on the under surface. The fruit is oblong, oval, about half an inch long, and one-third of an inch broad, with an entire discoid punctate stigma depressed in the centre. I have not however, been able to identify the species in the absence of flowers.

BUAH KUMBANG SA MANGOK.—Mr. Wray says, "This fruit swells up in water and is used in cases of dysentery. I have not been able to obtain full specimens of this tree, and it has not yet been described. The tree is a tall one, and the fruits fly far and wide, so that it is not easy to find the tree in the jungle, even when you come upon its fruits." This fruit resembles that of the "Bungtalai" of Siam, which is also known by the name of "Boa-tams paiaa" (Pharm. Journ. [2], iii., p. 6 [3], viii., p. 747, 764, and in China (' Hanbury Science Papers,' p. 230) as Ta-hai-tse. The fruit in the specimens furnished by Mr. Wray has the large boat-shaped follicle (which opens long before the seed is ripe) attached to the seed. The seed differs from that of "Bungtalai" in being covered with a dense velvety pubescence, and in the inner surface of the follicle being abundantly furnished, and the external sparingly so, with stellate hairs.

The other specimens sent by Mr. Wray consist of Kulitasiwang or "Culliawan" bark (Ph. J. [2], xxiii., p. 390), and a bottle of the hair oil used by the Malays, made of coco-nut oil and pandanus flowers.

SODIUM BISULPHITE in crystals, with 7 molecules of water of crystallisation, was found deposited from a large quantity of solution during the severe frost by R. E. Evans and C. H. Desch (Chem. News, May 24). They were stored in a well-stoppered bottle, and, as the weather became warmer, partly deliquesced, leaving anhydrous sodium bisulphite in fine pearly-white crystals.
EMULSIONS.*

The emulsions are liquid preparations consisting of oily, fatty, resinous, or otherwise insoluble substances suspended in watery liquids by the intervention of gum, mucilage, or other viscid material called emulsifying agents. They may be divided into (1) natural and (2) artificial emulsions.

Natural emulsions.—In natural emulsions are included all products of animal or vegetable origin, consisting of oily or resinous substances so combined with gum or albumin as to be readily miscible with water without separation.

Of animal products milk and egg yolk are the most typical emulsions, since their fat-globules are so finely divided and so perfectly distributed in the watery liquid as to require considerable agitation to separate them from the albuminous envelope, in order to obtain the fat. The operation of “churning” milk to produce butter is a good illustration of this, and is the reverse of the process of emulsification.

The milk juice of many plants, consisting of oil and gum or albumin, is deposited in fruits and seeds upon evaporation of the water. The nuts, especially almonds, are rich in this mixture, which, upon trituration with water, is restored to its original form of milk juice or emulsion. The official almond emulsion is a good example. Associated with resin and sometimes with ethereal oil the milk juice of many plants exudes and dries into semi-solid masses or tears. Examples of these we have in the gum-resins, ammoniac, and asafetida, which furnish official emulsions by beating them in a mortar with water. The amount of gum contained in a gum-resin is not always sufficient to emulsify the other constituents, resin and ethereal oil, and it is then necessary to add gum artificially in order to produce complete emulsification.

These natural products are the most perfect emulsions, and to simulate them is the object of pharmacal art. A natural emulsion may be greatly diluted with water without causing separation of the oil. This is the best test to indicate that an emulsion is perfect.

Artificial emulsions.—These are made by mixing the oil with a certain proportion of the emulsifying agent, adding water and trituration of the mixture in a mortar or agitation in a flask. There are various methods, but these are general rules:

The emulsification of the oil should be complete before the mixture is made up to the required measure. When alcoholic liquids are to be added, they should first be diluted as much as possible. Salts should be dissolved before being added. No heat should be employed, as the oil separates in an emulsion when heated. Emulsions should be freshly prepared and be preserved in a cool place.

The most common emulsifying agents, in the order of their general value, are:

- Powdered gum acacia.—With the powdered gum contained in a capacious flat-bottomed wedgwood mortar the oil is gradually incorporated. To this one and a half times as much water as of gum is added at once, and the mixture rapidly triturated with a rotary motion of the pestle. Soon the mixture becomes stiff and assumes a milk-white colour, the pestle motion producing a characteristic “crackling” sound when the emulsification is complete. This so-called “mother emulsion” may now be diluted to the required measure and other substances, flavours, etc., be added.

The proportion of gum required varies with different oils, an oil rich in gum, such as castor oil, requiring less gum than an oil poor in natural gum, as cod-liver oil. The following proportions hardly ever fail to produce complete emulsification: Oil, 4 parts; gum, 2 parts; water, 3 parts. Whenever a lesser proportion of gum is used water must be decreased in proportion, viz.: One and a half times as much water as of gum employed. The ethereal or volatile oils require a much larger proportion of gum than the fixed oils.

- Powdered tragacanth.—This may be used in the same way, or in the form of mucilage, but it does not produce as permanent emulsions as does gum acacia.

- Mucilages of acacia or of Irish moss (N. F.).—These are not as satisfactory as powdered gum; while they produce good emulsions the division of the oil-globules is not as thorough as in the preceding; emulsification being incomplete the mixture more rapidly separates into a heavier, watery liquid and a lighter, thick gelatinous emulsion, which requires thorough mixing before use.

- Extract of malt.—Extract of malt is an excellent emulsifying agent, when its use is admissible. The oil should be added to the malt extract contained in a capacious mortar and incorporated in small quantities at the time. A good article will emulsify an equal volume of cod-liver oil.

- Condensed milk and egg yolk.—These produce the most perfect emulsions and also the most palatable, but they rapidly ferment and spoil.

- Glycerin and sugar added to emulsions for the purpose of preservation and palatability induce separation, and their use is not advisable.

- Emulsification “by intervention” is the best and only reliable method to be employed with ethereal oils and all substances of themselves not emulsifiable. It is illustrated in the official chloroform emulsion. Oil of turpentine, for example, is emulsified by dissolving the turpentine oil in twice its volume of a bland fixed oil (almond oil), incorporating an equal weight of powdered acacia, adding water and proceeding as with an ordinary emulsion.

- Pancreatin.—Pancreatin emulsionises fats in preparing them for digestion, but it does not produce a permanent emulsion when used artificially. While, therefore, not a reliable emulsifying agent, it aids the assimilation of oils and its addition to emulsions is sometimes therapeutically desirable. As it is only active in alkaline media, the emulsion should be prepared with a little sodium bicarbonate.

The addition of alkalies to emulsions should be avoided. Soaps are not emulsions; neither is the use of soap-bark to be recommended.

* Lecture from the Course of the National Institute of Pharmacy. Reprinted from the Western Druggist.
been regarded as unfair to them, as well as a practical violation of the Pharmacy Act as regards the public. Within the past week a very important decision (see page 1110) has been given by the Lords Justices in the Court of Appeal in regard to companies of this kind, which appears likely to open the way for dealing with cases of "one-man companies" which involve evasion of the Pharmacy Act as well as the Companies Acts. Speaking of the intention of the Companies Acts, Lord Justice Lindley remarked that while the Legislature contemplated that it would provide means for the encouragement of trade—by enabling persons to associate together for carrying on business with a limited capital, and without liability or risk beyond the extent of such capital—it never contemplated an extension of limited liability to an individual trader. In the case under consideration there was the requisite number of seven shareholders in the company, but six of them were relatives of the principal shareholder, and they held only one share each. Though the company was therefore regarded by Lord Justice Lindley as duly created, he held that it was created for an illegitimate purpose, and was merely a device to enable one man to carry on trade with limited liability under the protection of the Companies Act, but contrary to its true intent and meaning. Lord Justice Lopez also concurred in regarding the company—perfect as it was in its machinery—as being, in truth and fact, the business of one man. He had the beneficial interest in it, and the company was a mere nominis umbra, under cover of which he secured advantages. Hence he considered that it would be lamentable if such a scheme could not be defeated, for if it were permitted to succeed, the Companies Acts would be perverted to protecting a device never contemplated by the legislature, besides being in reality opposed to the policy and provisions of the Acts. In his opinion the incorporation of such a company might be set aside by a scire facias.

Although the considerations involved in this case were of a purely pecuniary nature, the views expressed by the Lords Justices have an important bearing on the question whether the bogus or one-man companies formed for the obvious purpose of evading the provisions of the Pharmacy Act, do not fail to secure protection under the Companies Acts, or, at any rate, whether such a misapplication of the principle of limited liability should any longer be permitted to enable an unqualified person to evade the Pharmacy Act by associating with himself six members of his family, and carrying on in that way a business which he could not carry on as an individual. In many instances of this kind the illegitimate object is clearly apparent, and in regard to such misapplications of the Companies Acts it is well that the question of their legality
has been raised. On this point the Standard remarks that such concerns have of late grown up with startling rapidity, and if the Companies Acts do not warrant the extension of the principle of limited liability to sole traders which is involved in them, the sooner the public is made aware of the fact the better. In the case of bogus drug companies, two Statutes are evaded at the same time, and therefore such cases present additional reason for enquiry.

CHEMICAL WORKS INSPECTION.

The Lehnau soda works still hold their own against those of the ammonia-soda process because of the bleaching powder which they alone can produce, and Mr. Bernard E. Smith, the inspector for the north of England, reports that whilst the number of alkali works is stationary, and the work has been anything but brisk, the salt decomposed showing a decrease of 10 per cent., the bleaching powder works have been active, though they have produced a less quantity than in the previous year. The deposit of the objectionable alkali waste has been stopped, partly by its use for sulphur-recovery, and partly by the carriage of the refuse to sea. The ammonia process is shown to be continually gaining as regards the extent of the output of soda on the Lehnau process, but, as already stated, the latter still possesses the commercial advantage accruing from the practical monopoly of the production of bleaching powder. Mr. Edward Jackson, reporting upon the South Midland District, says the number of chemical works registered is — 9 alkali works, 157 scheduled and other works, total 166. The following are the separate processes under inspection:—

3 alkali works, 4 hydrochloric acid (cylinder) works, 2 hydrochloric acid (waste pickle recovery) works, 2 copper works, 26 sulphuric acid works, 46 chemical manure works, 2 gas liquor works, 2 muriate of ammonia works, 2 chlorine works, 8 cement works, 8 salt works, 7 sulphur recovery, 18 nitric acid works, 7 nitrate of iron works, 4 Venetian red works; total, 234. Seven additional works have been added to the register during the year—three for the manufacture of sulphate of ammonia, two for the manufacture of salt, one for the manufacture of chemical manure, one for the manufacture of chlorine. Two works have been closed—chemical manure and sulphate of ammonia. There has been a net increase of five works for the year. There are 71 works on the register for the manufacture of sulphate of ammonia, muriate of ammonia, and the concentration of gas liquor. One sulphate of ammonia plant has been stopped during the year, and three additional works have been registered. Under the heading of "Chlorine Works," special reference is made to the fact that in addition to the Weldon and Peckney chlorine processes in operation in the district, a new plant, around which a great amount of interest centres, has been erected at the works of the Aluminium Company at Oldbury, for the manufacture of caustic soda and chlorine electrolytically from brine, by Castner's patents. This process is described as though it were in practical operation, and practically pure caustic soda is said to be produced, whilst chlorine of 95 to 97 per cent. purity is obtained free from hypochlorites, the remainder being hydrogen. The main features of Mr. Castner's process have been already briefly described in the Journal as consisting in the use of a moving body of mercury, which completely separates, and so prevents any re-combination of the products of electrolysis.

PHARMACY IN VICTORIA.

By the courtesy of Mr. H. Shillinglaw, the Secretary and Registrar of the Pharmacy Board of Victoria, we have been favoured with an advance proof of the report of the proceedings at the celebration of the completion of the additions to the Melbourne College of Pharmacy. The report will be found at page 1104 of this week's Journal, and should prove of interest to our readers as showing the estimation in which the College and pharmacy generally are held by the Victorian Government. As already pointed out in the Journal, Victoria is happy in possessing what is virtually an ideal Pharmacy Act, and there is every reason for believing that, when the existing conditions of commercial depression in Australia have passed away, pharmacy in that colony will enter upon a more prosperous career, and fix itself more firmly even than at present in the truly professional position which is its due. Meanwhile, the cordial congratulations of British pharmacists are freely tendered to their brethren across the sea, who are wished the greatest possible measure of success in carrying out their educational programme.

DOMINION PHARMACEUTICAL ASSOCIATION.

Steps have been taken by the Pharmaceutical Association of the Province of Quebec, the oldest pharmaceutical body in Canada, to initiate the formation of a Dominion Pharmaceutical Association, and the Canadian Drugist reprints a circular letter on the subject addressed to the various pharmaceutical bodies in Canada. The matter was once before under consideration, in June, 1893, but delay on the part of provincial associations in responding to the communications addressed to them prevented further steps being taken at the time. The council of the Quebec Association has now appointed a committee to take up the matter, and a suitable constitution and bye-laws have been drafted. Copies of these have been sent to each provincial association with a request for comments or suggestions.
PHARMACEUTICAL EXHIBITION AT BRUSSELS.

The Société royale de pharmacie de Bruxelles will celebrate the fiftieth anniversary of its foundation, on August 15 next, by a national congress of pharmacy at Brussels. In connection with this there will be an international exhibition of pharmaceutical apparatus and products. Both the Congress and the exhibition will last for three days. The five sections of the Congress will deal with pharmaceutical legislation and ethics, theoretical and practical pharmacy, professional interests, the analysis of food-stuffs and commercial products, and hygiene and toxicology, respectively. The six sections of the exhibition will be devoted to fixtures, appliances, drugs, pharmaceutical preparations, accessories, and special products. Particulars may be obtained of M. L. Van Hulst, pharmacien, 12, rue Malibran, Brussels.

THE PHARMACOPEIA COMMITTEE OF THE GENERAL MEDICAL COUNCIL.

An important part of the business transacted at the meeting of the General Medical Council, on Tuesday last, was the appointment of the Committee by which arrangements will be made for the revision of the British Pharmacopoeia. After some discussion as to the number of members to be appointed on the Committee, it was resolved on the motion of Dr. Leech that the Committee should consist of the President of the Council, Sir Richard Quain, four members to represent England and Wales, two to represent Scotland, and two to represent Ireland. Those elected for England were Sir Dyce Duckworth, Mr. Brudenell Carter, Dr. Leech, and Dr. Macalister; for Scotland, Dr. Tuke and Dr. McVail; for Ireland, Dr. Athill and Dr. Charles Moore. The first meeting of the Committee was to be held on Wednesday, at half-past twelve.

THE METRIC SYSTEM.

Strong as British prejudices are in favour of the system of weights and measures with which the public is familiar, and great as the indifference is with which the advantages of the metric system are regarded by the majority, the fact that commercial transactions are now so largely carried on according to this system may be expected before long to exercise a powerful influence in its favour. From that point of view it seems probable that legalising the use of metric weights and measures for trade purposes will be the most desirable means of promoting the ultimate general adoption of the system. In evidence given by the President of the Pharmaceutical Society before the Select Committee last week (ante, p. 1065), this view was expressed in a manner which made considerable impression upon the members of the Committee. If the legalising of the metric system were adopted, one great obstacle to its introduction into the British Pharmacopoeia would be removed.

Proceedings of Societies in London.

CHEMICAL SOCIETY.

A meeting was held on Thursday, May 16, 1895, the President, A. Vernon Harcourt, F.R.S., in the chair. The following papers were read:

KJELDAHL'S PROCESS FOR THE DETERMINATION OF NITROGEN.

BY DR. R. DYER.

The nitrogen in manures, food-stuffs, and proteins is generally determined by means of Kjeldahl's method or some one of its many modifications, and in this respect the soda-lime method of analysis has been superseded in most agricultural laboratories. In chemical laboratories, however, which are devoted mainly to organic research, the method generally employed for the determination of the nitrogen is either the absolute method of Dumas or the soda-lime process.

In order to determine whether Kjeldahl's method can be employed generally, the author has made a series of analyses of the nitrogen contained in a number of organic compounds selected as types, and the results of this investigation are now communicated. The method employed was as follows:—A weighed quantity of the compound varying from 0·2 grammes to 10 grammes is placed in a round-bottomed glass flask, made preferably of Jena glass, and about 20 C.C. of strong sulphuric acid and a drop of mercury are then added. After gentle warming about 10 grammes of potassium sulphate is added, and the contents of the flask heated till the liquid is water-white, during which process a large quantity of sulphur dioxide is given off. The liquid after cooling is then transferred to a large flask fitted with a rubber stopper with two perforations, in one of which is inserted an ordinary tap-funnel, and in the other the extremity of a long tube of block tin, which is bent twice at right angles, and acts as a condenser. To the cold liquid excess of alkali is now added, and the whole boiled for half an hour, when the ammonia distils over through the tin tube, and is received into an Erlenmeyer flask containing standard acid, which is titrated in the usual manner. When mercury is used in addition to sulphuric acid a little potassium sulphide is added, as well as a little zinc foil to prevent bumping.

Blank experiments are always first made with sugar, and the error of experiment allowed for in subsequent determinations. When nitrates are thus analysed it is necessary to add phenol or salicylic acid to the substance, next the sulphuric acid, and lastly about 2 grammes of zinc. The whole is then allowed to stand till action has ceased. In determining the nitrogen in ammonium nitrate very low results were obtained, and this was found to be due to the escape of nitrous oxide, formed by the heat of the reaction with sulphuric acid. This is best remedied by adding the sulphuric acid from a beaker suddenly so that the whole of the ammonium nitrate is at once covered.

Very good results were obtained by this method with such compounds as uric acid, asparagine, caffeine, strychnine, quinine, pyridine, and the nitrates of potassium, ammonium, and ures. With aromatic
compounds containing amidogen, or of the azo type, accurate results could only be obtained by the addition of salicylic acid and zinc, such compounds being nitro-benzene, nitramine, azobenzene, etc. Hydroxylamino hydrochloride analysed by the ordinary method only gave 3 per cent. of nitrogen instead of the theoretical 20.21 per cent., but accurate numbers were obtained by using sugar and zinc in place of salicylic acid. Acetaldolixime behaved in a similar manner, and yielded similar results. Though accurate results were obtained by analysing potassium cyanide and ferrocyanide in the usual manner, such could not be obtained with the ferrocyanide, but by the addition of thiosulphate of sodium and zinc accurate results were obtained.

All methods failed to yield satisfactory results by analysis of sodium nitro-prusside, phenyl-hydrazine, or the glucosazone. The author, as the result of these experiments, recommends the trial of this method in place of the absolute or soda-lime process as being quicker and easier than the older method.

In the discussion which followed, Dr. Kipping pointed out that this method was not to be preferred to those generally in use. The apparatus for the older methods was always at hand in organic laboratories, and the absolute method of analysis was much simpler and more certain than the method proposed by the author. A fatal objection to this method was the necessity of adding such an agent as sugar, salicylic acid, or thiosulphate of sodium in order to obtain accurate results, and the uncertainty of knowing which of these agents to add would render results untrustworthy.

NOTION LIQUATION IN CRYSTALLINE STANDARD GOLD.
BY DR. ROSE.

The author had investigated the question of the homogeneity of alloys of gold with metals, as bismuth and lead, other than those found in standard gold. Gold which reaches the refiners often contains traces of these metals, and since the value of an ingot is judged by an assay of an outer portion of the mass, it is important to know if this is a fair sample of the whole ingot. Alloys of gold with silver and copper have been shown to be homogeneous, so the effect of traces of lead and bismuth was examined in the following manner: A quantity of standard gold consisting of molten sovereigns was mixed with 0.2 per cent. of bismuth and then the molten mass poured into a spherical mould. The metal on examination was found to be brittle and non-homogeneous, the interior of the mass being richer in gold than the exterior, the proportions of gold found being 912.8 in the outer cut to 913.8 in the inner sample.

An alloy with 0.2 per cent. lead was found to give similar results, and the same non-homogeneity of the mass was found with alloys of lead and silver.

This is due to the fact that the bismuth and lead remain molten after the gold and other metals have solidified, and there are thus two freezing points of the alloy.

In assaying gold containing lead or bismuth, it is necessary not only to take a sample of the exterior of the ingot, but also to take samples from the interior of the mass by boring or otherwise.

PREPARATION OF THE ACTIVE LACTIC ACIDS, AND THE ROTATION OF THEIR METALLIC SALTS IN SOLUTION.
BY DR. PURDIE.

The salts of the two optically active lactic acids have been separated by means of the zinc ammonium double salt, and for this purpose solutions of zinc lactate and ammonium lactate are mixed, and a crystal of the desired modification added, when the mass crystallizes and as much as 90 per cent. of the active salt can be obtained. It is thus possible to obtain any modification of lactic acid required.

A comparison was now made of the freezing-point and molecular rotation of the various metallic salts. On plotting the results of molecular rotations as a curve, with the angle of rotation and the concentration as coordinates, it was found that in aqueous solutions the molecular rotation of all the salts except silver increases with dilution. This must be due to ionic rotation, resulting from dissociation of the salt; in the case of the silver salt, however, the rotation increases with concentration of the solution. In the case of the zinc salts the curve showed that the rotation of the salt itself was greater than the ionic rotation.

With alcoholic solutions very curious results were obtained, since in very concentrated solutions the sign of rotation changed, and in very dilute solutions the rotation exceeded that of aqueous solutions, showing that molecular complexities give rise to varied rotation in addition to the rotation of the salt and ionic rotation.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting was held on Thursday, May 2, Mr. H. T. Durant, Vice-President, in the chair.

The Secretary read a list of the localities which had been decided upon by the Executive Committee for botanical excursions on Saturday afternoons. A paper was then read on—

MICHAEL FARADAY.
BY BERNARD JEALOUS.

It is, of course, impossible in a few minutes to do justice to a historical character, whether great or comparatively unimportant, and I can only hope to bring before you notice some points in the life and work of one who has done so much to advance the great branch of science with which we have to a certain extent to connect ourselves.

Michael Faraday was born in London in September, 1791, of humble parentage, and was educated in
little more than the rudiments, as we should express it, of the "three R's." At the age of thirteen he went as an errand boy to a bookseller, to whom in the next year he was apprenticed without premium in consideration—as worded in the indenture—of faithful service. Here, apparently, his scientific spirit showed itself, for we read of him constantly poring over books on science, and even attempting chemical and electrical experiments; he also occasionally attended lectures in the evenings on natural philosophy, but in this respect his financial condition seemed to be somewhat of a check.

He began near the end of his apprenticeship to write letters to his friend Abbot. This lasted for a considerable time, and on reading the earlier letters one cannot but be attracted by the correctness, ease, and style with which they are written; it is from his interesting letters written throughout his life to various people that the best account of his work is to be obtained.

The most important event, perhaps, in his life—his first acquaintance with Sir Humphry Davy—took place in 1812. He attended lectures given by Davy in Albemarle Street and took copious notes, afterwards writing them out more fully in a quarto volume. This he sent to Sir H. Davy, expressing his wish to follow up the science and asking favour on his views. The result of this was that early next year he was made laboratory assistant in the Royal Institution, with the salary of 25s. a week. Once there he commenced experimenting in earnest, some of his first operations being the extraction of sugar from the beetroot, and making a compound of sulphur and carbon. Shortly after he commenced work he was engaged with Sir H. Davy on the compounds of chlorine and azote. In his letters to his friend Abbot he speaks of the rather hard time they both had, owing to the explosive activity of these. His own account of an experiment may perhaps be of interest: 

"A tube was filled with dry boiled mercury and inverted in a glass also containing mercury; a portion of the compound was thrown up into it, and it was then left to act all last night. On examining it this morning the compound was gone; a substance was formed in the tube and a gas obtained. This gas was azote, the substance corrosive mercury, evidently proving it to be a compound of chlorine or oxymuriatic acid gas and azote. On repeating the experiment this morning, as soon as it was thrown up it exploded, and the tube and the receiver were blown to pieces. I got a cut on my eyelid, and Sir Humphry bruised his hand." He then proceeds to narrate further experiments with the compounds, which resulted in more grievous wounds, and adds somewhat significantly that he has concluded with the experiments for the present.

In October of 1813 he accompanied Sir H. Davy abroad for about eighteen months, visiting France, Italy, Switzerland, and other countries. It is scarcely necessary to mention that during the time he kept an elaborate journal, and wrote many letters. It is from this interesting record that we find in December of that year he assisted his master in experiments in the then new substance, iodine, which resulted in the conclusion that it was an elementary body. At Florence next year they performed the experiment of burning a diamond in oxygen; heat was applied to the diamond by means of the great burning glass belonging to the Grand Duke of Tuscany; this experiment apparently went off successfully, the diamond burning with a brilliant scarlet flame.

On returning to England he went back to the Royal Institution, having a full knowledge of his master's great genius and power, and he was now about to see him engage in research work on fire-damp and flame, which resulted in the invention of the famous lamp for miners. In January, 1816, Faraday gave his first lectures, which took place before the City Philosophical Society, the subject being "On the General Properties of Matter," and the later lectures including the rarer metals, such as rhodium, osmium, tellurium, etc. A year or two afterwards he read a paper before the same society on "The Inertia of the Mind," a paper which shows that his ability was by no means confined to the realm of natural philosophy. During July, 1819, he took a walking tour in Wales. He does not appear to have met with much in the scientific line, though a little encounter he had with a would-be scientist is perhaps interesting and amusing enough to quote in his own words:—"I wanted," he says, "a little alcohol, and having found out a doctor's shop and a spruce doctor's man got some, I then asked for a little spirit of salt. He got me a stopped bottle, and would have poured in acid, but it was not the acid I wanted, and I again mentioned spirit of salt to him, but at the same time adding muriatic acid to save his credit if possible. He now seemed to understand me, and reaching down another bottle, again prepared to pour, but I stopped him. 'It is muriatic acid that I want.' This is muriatic acid, sir.' 'No, that is nitric acid.' 'They are the same, sir.' 'Oh, no, there is a little difference between them, and one will not do for me as well as the other.' I then endeavoured to explain that the one came from nitre and the other from common salt. He comprehended a difference between the two bodies, but not between their acids, and he opened a pharmacopoeia at muriatic acid and uttered the Latin name and its synonyms fluently and with great emphasis, endeavouring to prove that the two were alike. I was really ashamed to correct the doctor. However, at last I made him comprehend that there was something like a difference between these acids, but I do not think he shut the book much improved by the affair."

In 1820, Faraday's work as an educated scientist may be said to have begun; but still he was only at the beginning of a much higher education, for it was not for eleven years that his first paper on "Experimental Researches in Electricity" was published. He then read before the Royal Society a paper on two new compounds of chlorine and carbon, and a new compound of iodine, carbon, and hydrogen; he also published notes of his experiments on the alloys of steel, to which at this time he paid considerable attention.
He married a year later, and it was shortly after this that he had the unpleasantness to be charged with dishonest conduct with regard to a great discovery he had made concerning electro-magnetic rotation; it was said that he had stolen the idea and subject, and even the experiments, from Dr. Wollaston, one of the great philosophers of the time; apparently, however, all was set right by a true statement of facts. In 1823 he analysed hydrate of chlorine, acting on the suggestion of Sir H. Davy; his method of working and the results are, I think, too well known to need mentioning here. He followed this up by various experiments on the liquefaction of gases, obtaining sulphurous acid, carbonic acid gas, sulphuretted hydrogen, and nitrous oxide in the liquid state.

A little friction was caused between Faraday and Sir H. Davy over the experiment on chlorine, probably due to jealousy on the part of the latter, and the nomination of Faraday to a Fellowship of the Royal Society was strongly opposed by Davy, but on the ballot being taken there was only one black ball. The Athenæum Club was founded the same year, and Faraday was made its first secretary, but he resigned the following year as the office was incompatible with his pursuits.

He was honoured in 1825 by being appointed Director of the Laboratory at the Royal Institution, and later on as Manager, a post of considerable responsibility. One of the first acts after this new honour was to invite members to a scientific evening in his laboratory; these meetings took place nearly every week, and at them various philosophers met, and much was done to popularise the high achievements of science. His first Bakerian lecture at the Royal Society was "On the Manufacture of Glass for Optical Purposes;" he was considerably engaged in the investigation of this subject about this time and had as his assistant a man named Anderson, who was characterised by his strict obedience, obtained from his military training. His duties were to attend to the furnaces. An anecdote is recorded of him that Faraday, who was wont to release him every night, on one occasion forgot to do so, and the man was found early the next morning faithfully stoking the glowing furnace. This most laborious work did not it seems end in the desired improvement in telescopes, but the glass manufacture became afterwards of great importance to Faraday in his magnetic researches.

Although Faraday's work continued much longer, it may not be inappropriate to sum up his work to his fortieth year, which seems to have finished a particular period. He had made discoveries in electro-magnetic motion and on the liquefaction of gases, laboriously investigated alloys of steel, and worked on the manufacture of optical glass; among his chemical discoveries were two chlorides of carbon, benzol and sulpho-naphthalic acid; he also had made experiments on the diffusion of gases, a subject which was followed up by Professor Graham. These are some of the more important points in his experimental work, but it is in the subject of electricity and magnetism that he really distinguished himself, and Tyndall speaks of him as at this time entering on a career of discovery unparalleled in the history of experimental science. Concerning this work, Faraday made the following avowal:—"I have rather been desirous of discovering new facts and new relations depending upon magneto-electric induction than of exalting the force of those already obtained, being assured that the latter would find their full development hereafter." This rather striking statement breathes the spirit that animated Faraday in his whole work. After pondering on the subject of the various electricities, he decided in favour of their identity; having established this fact, he proceeded to compare them.

He moistened bilious paper with iodide of potassium, and subjected it to the action of machine electricity he decomposed the iodide which formed a brown spot where the iodine was liberated; he then immersed two wires of zinc and platinum to a depth of 6/8ths of an inch in acidulated water during eight beats of his watch, and found that the needle of his galvanometer swung through the same arc and coloured his bilious paper to the same extent as did thirty turns of his large machine. In subsequent researches on the absolute quantity of electricity associated with particles or atoms of matter, he endeavoured to give an idea of the electrical force involved in the decomposition of a single grain of water; he estimated it as such that if concentrated in a single discharge it would be equal to a very great flash of lightning; while the chemical action of a single grain of water on 4 grains of zinc would yield electricity equal in quantity to a powerful thunderstorm. His reputation in 1839 shows itself in the titles he received from societies and colleges at Philadelphia, Boston, Paris, and Copenhagen; he also received the D.C.L. from the University of Oxford. A pension was offered him in 1835 by the Prime Minister, Lord Melbourne, but Faraday refused it owing to the blunt and inconsiderate manner with which the Premier addressed him with regard to it; but on receiving a written apology and regret of his refusal he decided to accept the offer. This affair caused a little excitement at the time, as it gave rise to unnecessary controversy in the Times and other newspapers.

Nothing eventful in his work seems to have occurred during the next few years, though during that time he was made scientific adviser to Trinity House. In 1841 the loss of memory and giddiness, which had troubled Faraday for some time, put a stop to his work, at least for about three years. On resuming his work he experimented on some gases, and while failing in his object of solidifying oxygen and hydrogen he succeeded in getting several gases into the solid state, including ammonia, nitrous oxide, and sulphuretted hydrogen. The second period of experiments in electricity covered ten years, and during this time he discovered the magnetisation of light, magnetic condition of all matter, and atmospheric magnetism. As the discovery of the magnetisation of light was such an important one, it may be worth
while to mention an experiment he made in connection with it. "A piece of his heavy glass about 2 inches square and 1/2 an inch thick, having flat and polished edges, was placed as a diamagnetic between the poles (not as yet magnetised by the electric current), so that the polarised ray should pass through its length. The glass acted as air, water, or any other substance would do and if the eye-piece were previously turned into such a position that the polarised ray was extinguished, or rather the image produced by it rendered invisible, then the introduction of the glass made no alteration in this respect. In this state of circumstances the force of the electro-magnet was developed by sending an electric current through its coils, and immediately the image of the lamp flame became visible and continued so long as the arrangement continued magnetic. On stopping the electric current, and so causing the magnetic force to cease, the light instantly disappeared." In 1853 he contributed a long letter to the Athenæum "On Table Moving," in which he opposed the idea of it being due to electricity, the rotation of the earth, or even to diabolical agency. This letter attracted considerable attention at the time, as it came from so high an authority.

In 1853 he was urgently asked to become President of the Royal Society, an honour which he declined, however, as he thought himself entirely unfit. The following year, through the instrumentality of Prince Albert, the Queen offered him a house at Hampton Court, where he spent the rest of his days. He continued his scientific work for the next few years, though failing health necessitated him doing less. His last day of experimental research was on March 12, 1862. His health continued to sink, and after a short period of semi-paralysis he died on August 25, 1867, at the age of seventy-six, and was buried in Highgate Cemetery.

Such is a brief and unworthy account of this great man who made such a mark on the scientific work, not only of his own time, but also on those which have to follow. The best record of his life and work would be incomplete without at least some reference to his character. His noble qualities constantly stood out during the times of misunderstanding and open jealousy to which he like all noted men was subject. Rarely perhaps has the grace of humility, combined with ardent zeal and untiring energy, shone with such brilliance as in the case of this great and this distinguished man. It was his great earnestness, his sympathetic kindness, and unassuming courtesy which so attracted and inspired the confidence of those who had the privilege to know him. His name will hold a far from inconspicuous position on our country's roll of fame, and the record of his work will be passed down to future generations as a lasting witness to the genius of the past.

A discussion followed, in which the Chairman, Secretary, Miss Gair and Miss Buchanan (who exhibited a photograph of Faraday taken from a daguerreotype) took part.

(To be continued.)

Provincial Transactions.

DOVER CHEMISTS' ASSOCIATION.

At the usual quarterly meeting of this Association on May 15, Mr. H. Peake in the chair, the following paper was read:—

ARSENALE OF LEAD AS AN INSECTICIDE.

BY J. F. BROWN.

It was recently suggested in one of the daily papers that arsenate of lead might with advantage be substituted for Paris green as an application to fruit trees and bushes for the destruction of injurious parasites. The risk of injury to the foliage was stated to be less, and the lead compound to be more easily held in suspension while used.

One ounce in eleven or twelve gallons of water is the strength recommended. The formula for preparing the arsenate was given as 11 ounces acetate of lead to 4 ounces of arsenate of soda. This is evidently based upon the lead test for arseniate of sodium, which was introduced into the Pharmacopœia in 1885. It is there stated that 12½ grains of the salt, dried at 300° Fahr., dissolved in water, and acidulated with acetic acid, requires not less than 34 grains of acetate of lead for complete precipitation. Some allowance for water or impurity is evident, since the quantity of acetate calculated from the equation

$$3Pb2C2H4O2.3H2O+2Na2HAsO4=Pb2AsO4+4NaC2H4O2+2HCHOH+9H2O$$

is 37.9 grains.

It occurred to me that the arsenite of lead would follow more closely the lines of the copper compounds which have been so widely used, and would be easily and cheaply prepared. To ensure the product being easily suspended in water the arsenite should be added in solution to half of the quantity used, and the lead solution to the remaining half. When mixed, a milky liquid results, which does not soon throw down a heavy precipitate.

The quantities for an ounce would be 133 grains of white arsenic dissolved in 3 fl. ozs. of solution of soda, and water to 6 ozs.; and 505 grains of acetate of lead in 6 ozs. of water. Or for 1 lb.—4 ozs. 382 grains of arsenic with 2 ozs. solid caustic soda in ½ gallon of water, and 1½ ozs. lead acetate in the like quantity.

Whatever alkali is used to dissolve the arsenic, the combination seems loose and imperfect, and the following equation gives the simplest view of the probable reaction with the lead salt:—

$$NaHAsO_3+Pb2C2H4O2=PbHAAsO_4+NaC2H4O2+HCHOH$$

Making the tenth of an ounce as an experiment, I found the precipitated arsenite, after washing and drying over a water bath, weighed 30 grains. On neutralising with solution of soda, a precipitate was thrown down which after similar treatment weighed 10.6 grains. And the filtrate continued to give a precipitate with the volumetric solution of nitrate of silver, until 300 grain measures had been added, this indicated 51 grains $AgNO_3=4.47$ grains $Ag_2AsO_4=3.81$ grains $PbHAAsO_4$ and $30+10.6+3.81=44.91$ grains of arsenite.
The ease with which a portion of the arsenite was retained in solution appeared an argument for its probable usefulness for the purpose in view.

Colonial Transactions.

MELBOURNE COLLEGE OF PHARMACY.

A number of gentlemen were present by invitation of the College, and, in addition to those mentioned above, the inviations including the Hon. G. Turner (the President), The Hon. A. Peacock (Chief Secretary and Minister of Education), the Hon. Robt. Best (Commissioner of Customs), the Hon. F. S. Grimwade, Sir James Patterson, Sir John M'Intyre, the Hon. Alfred Deakin, Dr. Rothwell Adam (President of the Medical Society), Dr. Greywell (Chairman of the Board of Health), Dr. Duncan Turner (President of the Dental Board), Dr. Wm. Snowball (President of the Victorian Branch of the British Medical Association), Professor Allen, Mr. Alfred Felton, M. E. Zor, M. L. A., Baron Sir F. von Mueller, Dr. J. E. Nield, M. D., W. M. G. (Under Secretary), Dr. Andrew Shields (Chief Medical Officer), Colonel Freeman, and Mr. H. J. Pooker.

The visitors were received by Mr. C. R. Blackett, Mr. Joseph George, and Mr. Shillinglaw, and shown over the building, with which they expressed their unqualified approval; adjournment was then made to the library, where luncheon was served. The chair was occupied by Mr. C. R. Blackett, President of the Pharmacy Board of Victoria, and the vice-chair by Mr. Joseph George, President of the Pharmaceutical Society of Australia. After justice had been done to the excellent lunch provided, the Chairman read apologies from Hon. the Premier, who was unable to be present through pressure of public business, the Hon. A. Deakin, Professor Allen, Dr. Shields, Dr. Nield, and Colonel Freeman.

The Chairman said before proposing the first toast on the list, he had, as President of the Board, been asked to make a few remarks. He held the office of President of the Board for some years. His colleagues insisted on re-electing him every year, and therefore, he was supposed on that account to have a more thorough knowledge of the meetings of the Board than anybody else—excepting, of course, the Secretary (Mr. Shillinglaw). The object of the little reunion that day was to allow those present, and especially those gentlemen connected with public affairs, to see the work which had been done and was being done by the College of Pharmacy. Some twenty years ago their most excellent old friend, Mr. J. Bosisto—who subsequently was returned to Parliament—introduced a Pharmacy Bill which ultimately became an Act, very great assistance being given in this by Sir James M'Culloch. Great authorities in Europe and America had highly approved of this Act, and the Pharmaceutical Journal of Great Britain of December 1, 1894, in an article on Pharmacy at Home and Abroad," said: "Regarding it from every point of view it will be seen that the Victorian Act is far and away the best drafted Act of any in force in English-speaking countries, and closely approaches the ideal. The foresight and wisdom of those pharmacists who had the framing of the Victorian Pharmacy Bill is inescapably apparent in the clever way to compare the status of the profession as it exists to-day with what it was before these worthy pioneers took the reins; for from the state of a mere trade which all classes could practice it has merged into a profession, and is recognised as such by all classes of the community, many of the pharmacists of Victoria being gentlemen who hold important public positions, and are the recipients of social distinctions of no mean order." That coming from the highest organ of pharmacy in the British dominions was, he thought, very great praise indeed. He might say that Mr. Michael Carteliege, the President of the Pharmaceutical Society of Great Britain, said "a man of great ability and knowledge—had repeatedly expressed his desire to model the future amendments of the Pharmacy Act of Great Britain on that of Victoria, if the exigencies of public business would only allow of the Act at home being so remodelled. Under the Act in Victoria a student must first pass a special examination, which ensured that he had received a liberal education, just in the same way as a lawyer must pass matriculation at the University. The next stage was that the student must be articled or apprenticed for four years; and after that period, or during that period if he liked, he could attend the lectures at the College or the Ballarat or other colleges recognised by the Board, and then he must come before the Board's examiners and pass his examination in botany, materia medica, and chemistry. The final examination in pharmacy was passed before the Board, the scientific examination being by examiners specially appointed by the Board, the examination of the Terms of Practice in the administration of the Pharmacy Act and of the Poisons Act. It was most important that the Poisons Act should be administered faithfully. He thought they had succeeded in overcoming difficulties which would disappear as the public became more enlightened on these matters. In the celebrated cases of Needle, the Richmond poisoner, last year, the importance of the Poisons Act came out very strongly. Had it not been for the strict registration regulating the sale of poisons it was quite possible the charge in that case would never had been so perfectly brought home.

To go into all those points would occupy more time than could be available or on that occasion. He would like to point out that the Pharmacy Board and the Pharmaceutical Society undertook double functions. The Pharmaceutical Society was a voluntary association which looked after pharmaceutical education in Victoria. The Society saw to the enrolment of students, saw that the students were properly educated, appointed lecturers and the teaching staff, and then the students had to be accepted and finally examined by the Pharmacy Board. The results of the work done by the Society in the last fifteen or twenty years had been most satisfactory. The members of the Society and the Board were satisfied that the desires to advance in every possible way pharmaceutical education in Victoria. What would be the use of highly educated medical practitioners with university training if pharmacists who dispensed their prescriptions were not equally well educated in the science of the day? Chemistry was a very large and most important branch of study, no one head contained all that was known or implied in the words chemical science. A man might have a general idea of chemistry, and a very firm, clear grasp of it, but to succeed he must more or less devote himself to special branches of the science. It was important to have highly educated pharmacists in order that the medical profession might be supported. That was self-evident. Botany which was so well taught in that College, was most important in a new country, where they had so many plants still unknown and uninvestigated, notwithstanding what the most wonderful men who had done wonders in the way of adding to the knowledge of the flora of Australia and Victoria. If the students from that College who went into different parts of the colony could become centres for the diffusion of scientific and industrial knowledge, instead of devoting themselves to football and cricket, it would add greatly to the convenience and welfare.
of the people. Then there was a large number of medical students in the College, and they were progressing very satisfactorily. He might now mention that from 1880 to 1894 some 984 students had come up for the Preliminary examination. In chemistry, many of them had presented themselves for examination in the same period. The College lectures, from 1883 to 1894, had been attended by 496 students (for the full course), and 290 students from the Melbourne University had attended the pharmacy course, and in the period from 1880 to 1894 some 412 persons had entered in articles of appointment. He might refer to one other point. They had provision there for the thorough teaching of the technical branches of chemistry. A soap boiler, a brewer, or a candle maker, or any other person who wished to study the science which underlay his business, could come to the College and receive a training in that science.

The College, he believed, might be made a most important centre for the education of the people of this colony, and nothing could be of more importance than that breeders, vignerons, and people connected with any industry should have a complete knowledge of the various chemical stages in those industries. That he considered must improve the point, and he hoped that in this respect the College would go on and improve. "Rest and be thankful" was the motto at the College, and he trusted the efforts made would receive the approbation of the people, and of the Government of Victoria, which had always liberally regarded scientific institutions. He trusted that the College would continue to merit that confidence, and act in every possible way in accord with the highest ideals in matters educational.

The toast of the Queen having been duly honoured, the Chairman proposed, "Her Majesty's Government in Victoria—Our present Ministry." Mr. Peacock responded. He said they were not there to discuss politics, but for an entirely different purpose—to discuss matters educational. The representatives of the Government, as well as the representatives of the Opposition, had come there for the purpose of discussing the work of the Society, and he had further to say that he was extremely gratified at the information which had been given them as to the work done there. There was only one point to which he would like to refer, although it was a point on which some other gentleman present might wish to bring forward. It appeared to him as a young student, in his native country, in view of all that had at times been said in reference to the multiplication of channels for one kind of work, that perhaps it was a pity there had been such a duplication of work in this particular science. The natural question arose why there should be this duplication—why students should be employed by the University, and a saving of expense thus brought about? That was the first point which occurred to his mind. He found they were proposing to establish a Dental College, and there were different other scientific institutions, all of which with less expense might be managed on other lines. It also appeared that this point might be explained and the objection he had suggested removed. He must express his delight as a member of the Government at being present on this occasion. He knew full well what an immense amount of work had been done, and it would be far better if the young men took advantage of such institutions, instead of devoting so much of their time, as in the past, to sports. As to the College being a centre of learning for the different country districts, Sir John McIntyre had on a former occasion pointed out the desirability of such a state of things, and he (Mr. Peacock) was sure that if the plan advocated by the Chairman were carried out it would be productive of immense good to the rising generation. He had much pleasure in responding to the toast on behalf of the Government, and regretted that the Premier and others of his colleagues were not present.

Mr. Best also responded on behalf of the Government. He said he had much pleasure in being present to witness what had been done by that very important Society, and to inspect the magnificent additions which had been made to the buildings. Old times came back to him when he observed the metamorphosis which had taken place in that building once the scene of so many legal fights. It was gratifying to find the old building turned to its present magnificent purposes. Members of the Government attended the opening ceremony with a degree of light-heartedness when they knew that the object of the gathering was not the seeking of further government assistance, but requests on the Ministers as one of the chief reasons why they should be present that day. The institution was subsidised—and most wisely subsidised—to the extent of £900 a year, and no extra assistance was asked. He observed with pleasure the advance made by the Society in the great science of chemistry, and in the spreading of practical pharmaceutical knowledge. He was struck, just as his colleague (Mr. Peacock) had been struck, with the idea that there perhaps might, with some considerable advantage, be some affiliation with the University. They must, however, recognise the statutory bond, the Society having been founded under Act of Parliament and having an ascertained statutory constitution. Under these circumstances the Government was called on to aid in every way in the development of that very important work. It was recognised that the education in pharmacy given there was equal to any given elsewhere in the world; indeed, he would not say that the education given there surpassed that of some other countries. He was glad that was so. In that country they had advanced education and had some of the highest educational standards that were required; and under those circumstances they might expect, if properly improved, the present educational institutions—to get the best men into those various professions. He hoped that that institution would play a great part in the history of the community.

When they bore in mind how enormously the health of the public generally depended on the efficiency and skill of those engaged in the compounding of drugs, it was essential that the best education should be given, that none but the best men should be authorised to dispense those drugs, and that the best possible supervision should be exercised to do the quality of those drugs. All this came within the jurisdiction of the College and of the Board, and when they prayed to be enabled to maintain the reputation of that institution, the public must feel reliance that they were perfectly protected. He was gratified to hear of the work being performed by that institution, and could only hope that prosperity would attend it, and that the expenditure on the new building would be more than justified, he thought.

Mr. J. George proposed: "The Parliament of Victoria." So far as their institution was concerned, it had nothing to complain of in regard to parliaments of the past, and he thought it had nothing to fear from parliaments of the future. Parliament seemed to be aware of the great work which was being done
by that institution, particularly in connection with the education of the rising generation in the colony.

Mr. F. S. Grimwade, M.L.C., responded on behalf of the Legislative Council. He was sure the Government had not been less anxious to see the University and its work well provided for than the Legislative Council. He was sure the Government had given the highest and most honourable of all. The professional nurses were now of such a class and so highly qualified that it was a delight to see the University. He hoped the utmost reverence and respect for the medical profession should be connected with the University, but it was suggested by practical men that that being an independent branch of the profession, it could be more conveniently managed where it was. At all events, it had been doing its work very well in the past, as the practical address of the Chairman informed them. It was of the greatest importance to the community that in these matters it should not be guided by ignorance, which was a curse to whatever branch of life it was found in connection with.

Dr. Duncan Turner responded. He said he had noticed every year a marked improvement in pharmacy in the colony. When he first came to Victoria, about twenty years ago, he found a number of chemists he would not entrust his prescriptions to. Every year, however, those men were getting fewer and fewer, and a better race of educated chemists was rising every year. It had been stated several times that the Board should be allied to the University. The Board had a grant of about £2500 a year, and it was managed on the most economical lines. It was so managed that the Board could be more than £2500 a year. Mr. S. Grimwade had done better work for less money than the University would require.

Mr. F. S. Grimwade proposed "The Pharmacy Board and the Pharmaceutical Society and College." In the speeches which had been made there had been ample evidence as to the work the Pharmacy Board and College had done. The members of the Pharmacy Board had not been rewarded by fee or reward. The chief secretary had raised the point as to whether it would not be better to have the teaching part of the institution allied with the University. When the Pharmacy Act was passed, the Pharmacy Board took on themselves the responsibilities of teaching the medical students. The Pharmacy Board worked for some two years in communication with the University authorities to ascertain whether they would provide accommodation for lecturers and take charge generally of the teaching of this particular branch of science. After two years' consideration the University authorities, they did not see their way clear to provide accommodation for lecturers or give accommodation for lecturers. The Pharmaceutical Society therefore had to undertake the provision of the school, and of the fact that the Society had done the work well, enough had been said. There was no doubt the teaching there was of the best, and if it was not done by the University itself, it was done by a teacher who was a student, and in that time had had a good deal of experience. Ten years ago he had the honour of meeting the President of the Pharmaceutical Society of Great Britain and of visiting that institution several times. He had also had an opportunity of visiting the similar institutions of Philadelphia, Ohio, and Canada; and the teaching provided at the school here in Victoria was, as he had said, as good as any in the world. And it had to be borne in mind that this teaching had only cost the Government for six years the sum of £900 a year. Had the school been allied to the University he had no doubt the teaching would have cost a great deal more than the sum he had mentioned. No one in Victoria had seen more of assistants, both of this and other countries, than he had, and he unhesitatingly said that the young men training here were men of whom any country might well be proud. There was every reason to hope that the profession would be filled with their number. They would know he was speaking from experience when he told them that his sons were trained in the College.

The President responded. The new buildings were, he said, to a certain extent erected out of savings on the part of the Pharmaceutical Society; not a single penny had been asked from the Government towards the buildings. They had been forced to enlarge the laboratories in consequence of the increasing number of students who came from New South Wales, Tasmania, South Australia, Queensland, and even from Fiji. Mr. J. Boistot also responded. He was glad that the new buildings had been necessitated by the increasing number of students, and he must admit that he felt a little bit proud of the position which the institution now occupied. From 1874 to 1876 he and his brother pharmacists worked together with a view of bringing in a Pharmacy Bill which should be equalled by none in the whole world, and the present Act was recognised by authorities at home as a credit to the Parliament of this country. When he went to England in 1886 he had to address the Pharmaceutical Society, showing the differences of the vegetation of Great Britain and Australia, and as an Australian he might be permitted to say that they were so struck with the observations he then made that he was now an honorary member of the Pharmaceutical Society of Great Britain. The present system of pharmacy teaching in Victoria was only equalled by
the highest educational establishments of Europe, and the best endeavour had been made to teach their young people the value and importance of a thorough education in pharmacy—an education equal to that of any school in the world. The greatest fault he as an examiner had to find with the students here was that, while perhaps astonishingly perfect at examination, they, in a great many instances, made no effort to exercise their talents in further educating themselves once they had got their certificate. That was to be very deeply regretted, for in that really grand country there were a great number of plants containing properties of immense value awaiting investigation. The proceedings then terminated.

Proceedings under the Pharmacy Act.

THE PHARMACEUTICAL SOCIETY v. ARMITAGE.

In this case, which came before His Honour Judge Bacon, at the Bloomsbury County Court, on Thursday, May 33, the Pharmaceutical Society sued John Story Armitage, carrying on business as a chemist at No. 1, Colva Street, South Highgate, for two penalties of £5 each, for having on two separate occasions sold a scheduled poison, he not being qualified to do so within the provisions of 81 and 32 Vio. c. 121.

Mr. Grey appeared as Counsel for the Society and stated that the articles sold by the defendant in this case were Powell's balsam of anised and Dr. Collis Brown's chlorodyne, which both contained morphin.

Mrs. Partridge proved the purchase by her on February 20 of a bottle of Powell's balsam of anised from the defendant's wife, Mrs. Armitage, and on the 23rd she was served by the defendant with a bottle of Collis Brown's chlorodyne.

Mr. Partridge, husband of the previous witness, deposed to having gone to the defendant's shop in January last, when he tried to purchase a bottle of chlorodyne, but the defendant refused to serve him, although he (witness) saw some bottles in the shop.

Mr. E. J. Eastes, analytical chemist, said he had analysed the two bottles in question. The bottle of Powell's balsam of anised contained a fluid ounce, which on analysing he found to contain 27% of a grain of morphine. The bottle of chlorodyne contained 1 grain of morphine.

Mr. Dalby, who appeared as counsel for the defence, called

Mr. Armitage, who said he had a Wisconsin Medical Degree, besides which he was a Licentiate of the Royal College of Dental Surgeons, Dublin, an Associate of the Society of Apothecaries, London, and a Member of the United Society of Chemists. He was not qualified under the Pharmacy Act. He denied that he had for over two years sold, or kept for sale, Collis Brown's chlorodyne. Neither of the bottles produced by Mrs. Partridge came from his shop.

Cross-examined: His shop was called a doctor's shop. He was away from it the greater part of the day, being a dispenser at a hospital. When Mr. Partridge came to his shop he had not a bottle of chlorodyne in the place, though he believed he had an empty bottle, the contents of which he had used himself when ill. He had "dummy" chlorodyne bottles in his case.

Mrs. Armitage was then called, and said she was a certified midwife. She denied having sold a bottle of Powell's balsam, as alleged by Mrs. Partridge.

Mr. Dalby said it was purely a question of whether the articles had been sold by the defendants as alleged or not, and it would be for his Honour to say which side he believed. His other point was that section 15 did not impose a penalty for an isolated sale. The language of the section seemed to require something more than that. The words of the section were: "From and after the 31st day of December, 1865, any person who shall sell, or keep an open shop for the retailing, dispensing, or compounding poisons," which clearly pointed to a systematic procedure.

His Honour: Do you mean that he must sell both arsenic and prussic acid before he makes himself liable to a penalty?

Mr. Dalby said if the words were "shall sell any article of poison" the matter would be beyond a doubt; but when the words were "any person who shall sell poisons," that referred to a practice of selling poisons.

His Honour, in giving judgment, said there was no difficulty in it, though, no doubt, the point raised was a very ingenious one. It was clear to his mind that the articles in question did contain poison. He was also satisfied upon the evidence that the two sales were effected, though he had great doubt whether it was judicious on the part of the Pharmaceutical Society to employ people to go about and get up evidence; still, they might get the penalties under this Act, what they did was for the protection of the public. The defendant's explanation of the presence of a bottle of chlorodyne in his shop, which he admitted, was a very lame one. There would be judgments against the defendants for two penalties and costs.

THE PHARMACEUTICAL SOCIETY v. HILLS.

In this case, the defendant, Mrs. Lavinia Hills carries on business at 91, Lower Marsh, Lambeth. The Pharmaceutical Society sued for one penalty in respect of a sale of Powell's balsam of anised on February 25 last. In answer to the usual letter from the Society's solicitor a letter was received stating that the business was conducted by Mr. W. M. Thompson. Mrs. Hills was then on March 17 ordered to produce, as a widow and promising to get a qualified assistant. Mr. Grey contended that unless Mrs. Hills was herself properly qualified she could not keep open shop for the sale of poisons.

Mr. Ray, solicitor, who appeared for the defence, said Mr. Thompson was a qualified apothecary and cited section 16 of the Act, under which he submitted that the executor of a deceased chemist was entitled to carry on the business under the management of a legally qualified chemist.

After some discussion the further hearing was adjourned to June 20 for the defendant to produce evidence as to the qualification of the late Mr. Hills.

THE PHARMACEUTICAL SOCIETY v. HOGG.

In this case the defendant, J. A. Hogg, who carries on business at 45, Walworth Road, S.E., as a manufacturer, did not appear.

Mr. Partridge proved the purchase on December 15 from the defendant of a packet of rat and mouse poison called Hogg's 'Rhadentium.'

Mr. E. J. Eastes deposed to having analysed the article in question, which he said contained 52 per cent. of arsenic. In the whole packet there was 250 grains of arsenic.

Mr. Grey put in the Register of the Pharmaceutical Society to show that the defendant was unqualified.

His Honour gave judgment for the penalty of £5, and costs.
Leibices and Notices of Books.

The Medical Annual and Practitioner's Index for 1895. Pp. 626. Price 7s. 6d. (John Wright and Co., Bristol.)

This, the thirteenth issue of a well-known yearbook, will bear favourable comparison with its predecessors. The publishers have been successful in maintaining the peculiarly by which it is distinguished from similar works; this consists in devoting many pages to the consideration of particular subjects, in addition to the questions which have been more especially under consideration in the past year. Of these, "Eyesight and School Life," by Mr. Simeon Snell; "Infantile Paralysis," by Mr. Robert Jones, of Liverpool, and Dr. John Redlon, of Chicago; and "Doubting of the Uterus," by Mr. John Taylor, of Birmingham, deserve especial attention.

The book abounds with information relating to improvements in medicine and surgery, including therapeutics and pharmacy. New remedies, new books, new instruments, etc., are judiciously considered. The latest information in regard to diphtheria and antitoxin is furnished by Dr. Ruffer. The ‘Medical Annual’ is in every respect an admirable book, and invaluable to practitioners of medicine.

British Pharmaceutical Conference.

A meeting of the Executive Committee was held at 17, Bloomsbury Square, on Wednesday, May 22.

Present:—Mr. N. H. Martin (President), Messrs. Atkins, Attfield, Cartelgh, and Toone (Vice- Presidents), Mr. John Moss (Treasurer), Messrs. Holmes, Bird, Mathews, and Farr; Mr. Hardwick (Hon. Local Sec.), Messrs. Naylor and Ransom (Hon. Gen. Secs.), and J. C. Nightingale (Asst. Sec.).

Letters of regret for non-attendance were received from Messrs. Hayes, Groves, Ewing, Walls, Bos, and Bridge.

The minutes of the previous meeting were read and confirmed. Messrs. Toone and Hardwick, as a deputation from the Local Committee, presented an outline of the suggested arrangements in connection with the forthcoming meeting of the Conference at Bournemouth. The reception by the President is to be held at the Hotel Mont Doré, on the evening of Monday, July 29. That hotel is to be the headquarters of the Conference, and accommodation will be there provided for a considerable number of members attending the meeting. The President will deliver his address in Shaftesbury Hall on the Tuesday morning, and this will be followed by the reading and discussion of papers. Luncheon will be provided at the Hotel Mont Doré. At the conclusion of the business in the afternoon it is intended to take a steam-boat excursion to Swanage, from the neighbourhood of which very fine coast views are to be obtained. The reading of papers and official business of the Conference will be concluded on the Wednesday afternoon. The usual smoking concert and ladies drawing-room will be held at the hotel during the evening. The following day will be devoted to an excursion by coaches to Christchurch, and thence through the most beautiful parts of the New Forest. Luncheon will be provided in the neighbourhood of Lyndhurst, and the return journey will be via Ringwood.

In accepting the suggested programme, a vote of thanks was passed to Messrs. Hardwick and Toone for their kindness in coming from Bournemouth to lay the above proposals before the Committee.

Some discussion took place with regard to the form of the usual white circular issued to members, and the Secretaries were authorised to make any alterations that they might consider desirable. Thirteen gentlemen having been duly nominated were elected to membership.

Correspondence.

[Letters should be written as concisely as possible, on one side of the paper only, and preferably with name and address for publication.]

The Research Laboratory.

Sir,—I cannot refrain from expressing my opinion that the Pharmaceutical Society is very much indebted to Mr. Butl for directing the attention of its members to the doings at the Research Laboratory; it is unfortunate that the Council should have permitted the Director of that Laboratory to prosecute chemical researches which are of so little value to pharmacy and medicine, at the expense of the Society. Surely there are subjects enough to be found for research which might be of use in medicine. The Blue List just issued by the British Pharmaceutical Conference contains no less than sixty-three subjects which require investigation, many of them have appeared yearly for some time past, therefore there should have been no difficulty on the part of the Director of the Research Laboratory in selecting appropriate subjects for investigation, the results of which could have been read and discussed before the Conference, or in the theatre of the Society.

1, Trevor Terrace, S.W.

J. B. BARNES.

The Council Election.

Sir,—After perusing the scrutineers’ report upon the recent Council election, I cannot forbear remarking upon the apathy displayed by the members of the Society generally, 46 per cent. not taking the trouble to vote. Is it the railers against the Society who neglect to exercise their franchise? If so, how large a number they represent; if friends, surely a little interest might be taken to assist in obtaining a good working representative Council to uphold the interests of the trade for the entire kingdom. At present the Council is composed of London members and from the southern portion of the kingdom, Yorkshire and Lancashire, with their large populations, send only one representative each. Westmoreland and Cumberland have no representative; the former county has never had one during the whole period of the Society’s existence. It would be an interesting subject for publication to acquaint us how it comes to pass that 1 per cent. of the voters (I do not ask for their names) were unable to fill up their papers correctly. It might possibly help to prevent such a deplorable occurrence in future.

Harrogate.

B. HAYTON DAVIS.
Notes and News.

EDINBURGH DISTRICT CHEMISTS' TRADE ASSOCIATION.—The Committee of this Association has arranged the programme of the picnic to be held at Kinross, on Wednesday, June 12. The party will proceed by rail to Perth, where carriages will be ready to convey the company through part of the city, and thence by the Bridge of Earn and Glen Farg to Kinross. Dinner will be served on arrival at the Green Hotel, and two hours will afterwards be available for visiting the interesting sights in the locality, including Loch Leven and the Island of St. Serf, where the ruins of a monastery founded by St. Serf, one of the disciples of St. Columba, are still to be seen. The prices of the tickets will be the same as last year, viz.: double ticket, £1 2s.; single ticket, 12s. 6d., and the Committee has arranged for the issue of tickets for juveniles at 6s. each, which may be had from the Honorary Secretary, Mr. Claude F. Henry, 1, Brandon Terrace, Edinburgh. Any members or friends of the craft who may be visiting the neighbourhood will be heartily welcomed at the picnic.

R. H. DAVIES' FUND.—The balance-sheet in connection with this Fund has now been duly audited by Mr. Michael Cartelgh, and shows that the sum of £750 11s. was received from subscribers. Of this amount the Committee has invested £700 with the Sun Life Office for the purchase of a certain annuity of £61 12s. for fourteen years. The proceeds will be devoted for the benefit of the children of the late R. H. Davies, and Messrs. E. J. Bevan and Wm. Chatterway are acting as trustees. Expenses have absorbed £41 8s. 2d., and the cash in hand and at the bankers amounts to £9 2s. 10d.

PRESCRIBING BY CHEMISTS.—Dr. Wynn Westcott, the Coroner for North-East London, has been interviewed by the Echo on the subject of prescribing by chemists, and is reported as saying that, although the drugs given by chemists may not be harmful in themselves, they do harm, nevertheless, for they lead to a delay in obtaining correct diagnosis and proper treatment. Another thing that he thinks does still more harm than prescribing by chemists, is the habit they have of recommending patent medicines. Dr. Westcott admits that it would be impracticable to compulsorily suppress these unorthodox methods of doctoring, and chiefly hopes for improvement from educating public opinion on the matter. “What we must convince parents is,” he said, “that for them to go to a chemist for advice when one of their children is ill is to defeat their own purpose by delaying a proper diagnosis, and, therefore, a correct treatment.”

INSTITUTE OF FRANCE.—In connection with the celebration of the centenary of the Institute of France, in October next, there will be a reception of foreign representatives by the Minister of Education, in addition to a banquet, a dramatic entertainment, and a reception at the Elysée by the President of the French Republic.

DIPHTHERITIC ANTITOXIN IN BAVARIA.—According to the Pharmaceutische Zeitung, out of 143 authoritative recorded cases of diphtheria in Bavaria, in which antitoxin serum has been used, 14 ended fatally.

STATUE TO LAVOISIER IN PARIS.—An international appeal for subscriptions is about to be made by the Institute of France, for the purpose of erecting a statue to Lavoisier. Subscriptions may be sent to 55, quai des Grands Augustins, Paris, addressed to the Treasurer of the Lavoisier Memorial Committee.

GERMAN ENTERPRISE.—Capelle, of Berlin, is the author of the book ‘Englische Apotheken Praxis,’ the purpose of which is to assist the German pharmacist, especially those residing at watering places and popular health resorts, in gaining the patronage of British visitors. Recipes are given for preparing the various draughts so popular with English people, and our patent medicines are dealt with, as well as British homoeopathy. The author holds that one or more of the assistants should be acquainted with the English language, and recommends the keeping of English newspapers for use of the customers. There is no doubt, states the Pharmaceutische Centralhalle, that these small attentions go far in inspiring the customer with a certain amount of confidence towards the pharmacist.

CHEMISTS' TRADE PROTECTION SOCIETIES.—A correspondent of the Birmingham Daily Post remarks that it seems inexplicable to him that such an intelligent body as the retail chemists do not combine to protect themselves against the starting of the large popular-price drug stores, which occur with a frequency that must be taking the bread out of their mouths. In order to cope with the demand of modern times—viz., to buy at lowest price for cash—it is suggested that chemists might amongst them establish a buying syndicate, to which all their combined orders would be given, thus enabling them to buy in large quantities for cash and compete with the stores. It is thought that the expense of working such a syndicate would be very little, whilst the advantages are too apparent to need comment. They might also, he observes, manufacture many drugs, and get the manufacturers', wholesalers', and retailers' profits.

POISONING BY EXALGINE.—A writer in the Lancet reports a case of poisoning by five grains of exalgin, administered to a woman (30) suffering from severe asthma and consequent insomnia. The effects were experienced within five minutes, the patient becoming perfectly stiff and unconscious. Recovery was effected with considerable difficulty, and attention is drawn to the evident danger of administering exalgin—a respiratory poison—to a child, even in moderate doses.

THE B.P. AND NEW ORGANIC REMEDIES.—Messrs. Helsing and Passmore have followed up their suggestions for future pharmacopoeial requirements of essential oils, by dealing with new organic remedies on similar lines, the results of their work being published in pamphlet form.
**English News.**

[Readers are invited to send local information of pharmaceutical interest. When newspapers are sent the paragraphs to be noted should be plainly marked, whilst cuttings should be verified by the addition of source and date.]

**IMPORTANT DECISION WITH REGARD TO "ONE-MAN" COMPANIES.** A very important judgment was pronounced on Tuesday last in the Court of Appeal, which may possibly have more far-reaching results than were present even to the minds of the learned Lords Justices in pronouncing it. That the knowledge and skill of the pharmacists and druggists as a body are more or less directly interested, though the business out of which the transactions in question arose was of a very different character. A few extracts from the judgment will fully justify this statement, and it is only necessary to add by way of introduction that the case was very fully argued about a fortnight ago by the most able counsel at the equity Bar, and that each judge has delivered a carefully considered written judgment.

The case appeared in the list as Broderip v. Solomon, and Lord Justice Lindley, in beginning his judgment, said: "This is an action by Solomon against an order made by Mr. Justice Vaughan Williams, which, in effect, directs Mr. A. Solomon to indemnify a limited company formed by him against the unsecured debts and liabilities incurred by or in the name of the company whilst it carried on business. The appeal raises a question of very great importance, not only to the persons immediately affected by the decision, but also to a large number of persons who form what are called 'one-man companies.' Such companies were unheard of until a comparatively recent period, but have become very common of late years. The Lord Justice then went through the facts of the case, and having detailed how Mr. Solomon—who was a leather merchant and wholesale bootmaker—sold his business with all necessary formalities to a company, of which the sole members were himself, his wife, daughter, and four sons, continued: "I proceed to examine the legal aspect of the case, which, as I have said, is one of great general importance. There can be no doubt that in this case an attempt has been made to use the machinery of the Companies Act, 1862, for a purpose for which it never was intended. The Legislature contemplated the encouragement of trade by enabling a comparatively small number of persons—vis., not less than seven—to carry on business with a limited joint stock or capital, and without risk or liability beyond the extent of such joint stock or capital, but the Legislature never contemplated an extension of limited liability to a sole trader or to a fewer number than seven." Again, "although in the present case there were and are, seven members, yet it is manifest that six of them are members simply in order to enable the seventh to himself carry on business with limited liability, and the object of the whole arrangement is to do the very thing which the Legislature intended not to be done, and ingenious as the scheme is, it cannot have the effect desired so long as the law remains unaltered. The incorporation of the company cannot be disputed; that follows from section 18 of the Companies Act, 1862. Whether by any proceedings in the nature of a scire facias, the Court would set aside the certificate of incorporation, is a question considered, and on which I express no opinion, but be that as it may, in such an action as this the validity of the certificate cannot be impeached. The company must therefore be regarded as a corporation, but as a corporation created for an

**THE JAPANESE MONOPOLY OF CAMPHOR.** The Spectator remarks that it is a curious incident of the cession of Formosa, that it directly affects every druggist in Europe, since camphor is produced only in Japan and Formosa. The Japanese, knowing that, have limited and taxed its export, and the price of the article is going up by leaps and bounds. Like all drugs that are greatly wanted, our contemporary points out, camphor will bear a high price and great fluctuations in its value; "but if the Japanese push their advantage too far, science will avenge herself and provide a substitute. There is a substitute for everything somewhere, even for quinine, and greediness in selling, if pushed beyond a certain point, always ensures its production."

**LIFE AND WORK IN EGYPT.** Dr. D. Harvey Atfield, M.A., Cantab, quarantine medical officer at Suez and Moes' Welle, and sub-director of the Mecca pilgrim encampment at El Tor, has completed his first year's service in Egypt, and records his experience in his journal, which has been printed for private circulation amongst friends. Naturally, the book is chiefly occupied with the minor details of every-day life, but this is every-day life in Egypt, and therefore of more than ordinary interest to stay-at-home folk. The general impression left on the mind of the reader is that work in Egypt savours strongly of play, but then, of course, a private journal must not be regarded as a record of professional duties performed. A serious turn is given to the book by including as appendices reprints of Dr. D. H. Atfield's papers "On a Solidified Glauber's Salt Lake," and "On Water Purification by Infusion."

**CURIOS WINDOW ATTRACTION.** American pharmacists do not invariably depend upon their scientific attainments for a livelihood, any more than do their English brethren, and occasionally they even stoop to attract a crowd, as witness the following from the Alumni Report of the Philadelphia College of Pharmacy:—"A. A. Kroeg, '78, had in his show window, at his store, Charles-town, S.C., a wild raccoon, which attracted much attention. It broke its chain, however, and did considerable damage."
illegitimate purpose." His lordship concluded his judgment by stating the form of the order, which would be made as follows:—"This Court being of opinion that the formation of the company, the agreement of August, 1892, and the issue of the warrants to Aaron Solomon pursuant to such agreement, were a mere scheme to enable him to carry on business in the name of the company with limited liability, contrary to the true intent and meaning of the Companies Act, 1862, and further, to enable him to obtain preference over other creditors of the company, dismisses the appeal of Aaron Solomon with costs."

Lord Justice Lopes in the course of his judgment said: "It never was intended that a company should be constituted to consist of one substantial person and six mere dummies and nominees of that person without any real interest in the company:" and, a little further on, "To legalise such a transaction would be a scandal." He concluded by saying that he was inclined to think that on a scire facias the incorporation of the company might be set aside, but he would express no decided opinion on that point.

Barrister Kay, in his judgment, said: "the Statutes were intended to allow even or more persons, bond fide associated for the purpose of trade, to limit their liability under certain conditions and become a corporation, but they were not intended to legalise a pretended association for the purpose of enabling an individual to carry on his own business with limited liability in the name of a joint stock company."

It will no doubt be observed from the above quotations that the learned judges were dealing only—as they were alone called upon to deal—with pecuniary considerations, on the one hand the motive operating on the individual trader in seeking to obtain the advantages of the Companies Acts for his own pecuniary benefit, and on the other the injustice to which creditors of the company would be exposed if such transactions were upheld. But there are in some peculiar cases certain advantages of a totally different kind attached to registration under the Companies Acts, and the language of the learned Lords Justice above cited would seem to indicate a strong probability at any rate that where such advantages are in the circumstances illegitimate, means may be found, even in the present state of the law, for setting aside the registration.

NOTTINGHAM AND NOTTS CHEMISTS' ASSOCIATION.—The annual meeting of this Association was held at the Masonic Hall, Nottingham, on Wednesday, May 22, when the members turned up in good numbers. The chair was occupied by Mr. Councillor Fitz-Hugh, J.P. From the report it appears that the numerical position of the Association has been improved during the year, and now stands at fifty members and thirty-four associates. An effort was made at the commencement of the session to arrange meetings for members, but the response was so poor that they had to be abandoned. The educational work has, however, been more prosperous, the arrangements with the University College being on a very satisfactory basis. The botany class, conducted by Professor Carr, M.A., was attended by twenty-nine students in the first two terms, with an average attendance of 83 per cent., and the third term is being attended by twenty students.

The dispensing class, conducted by Mr. F. R. Sergent, has also been very prosperous, more students applied for admission than could be accommodated, and the average attendance was 93 per cent. At the examination the following obtained prizes:—Messrs. E. Richardson, W. A. Cooling, and Whitworth, who respectively obtained 90, 50 and 70 per cent. of the total number of marks obtainable. During the year the following associates have passed the Pharmacu-

The Treasurer's account showed a balance in hand of over £250.

A hearty vote of thanks was accorded to Mr. Sergent for his invaluable services as teacher of the dispensing class, and a similar compliment was paid to Mr. W. Gill, who is resigning the secretary-ship after holding the office for five years.

The following were elected to office for the ensuing year: President, Mr. Councillor Fitz-Hugh, J.P.; Vice-President, Mr. T. Mason; Treasurer, Mr. J. Wilford; Honorary Secretary, Mr. A. Eberlin.

Auditors: Messrs. W. H. Parker and E. Gascoyne.

A cordial vote of thanks was passed to Mr. Fitz-Hugh for his services as President.

An alteration was made in the Rules, reducing members' subscriptions to 5s. per year.

Mr. F. Lunley introduced a discussion on the Shops Early-Closing Bill, but owing to the late hour the matter was adjourned till the next meeting.

—EDINBURGH CHEMISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION.—The Committee of this Association has arranged Botanical Excursions to be held as follows:—

<table>
<thead>
<tr>
<th>Date</th>
<th>Place</th>
<th>Meet at</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>1895</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>June 6</td>
<td>Blackford Hill</td>
<td>Blackford Hill Stn.</td>
<td>8.30 p.m.</td>
</tr>
<tr>
<td></td>
<td>26 Colinton Dell Caledonian Station</td>
<td>8.30 p.m.</td>
<td></td>
</tr>
<tr>
<td>July 15</td>
<td>Inveresk</td>
<td>Waverley Station</td>
<td>By Rail</td>
</tr>
</tbody>
</table>

*8.18 p.m. Train to Inveresk.*

The Committee has also arranged Summer Meetings to be held at 36, York Place, Edinburgh, as follows:—

<table>
<thead>
<tr>
<th>Date</th>
<th>Time</th>
<th>Time of Demonstration</th>
</tr>
</thead>
<tbody>
<tr>
<td>1895</td>
<td></td>
<td></td>
</tr>
<tr>
<td>June 19</td>
<td>8.30 to 10 p.m.</td>
<td>9.15 p.m.</td>
</tr>
<tr>
<td>July 15</td>
<td>8.30 to 10 p.m.</td>
<td>9.15 p.m.</td>
</tr>
</tbody>
</table>

These meetings will be devoted to examination of, and demonstration on, plants, and will be preparatory to the succeeding botanical excursion. Members are therefore requested to send or bring specimens of plants to them. A book prize, value 5s., will be presented to the Apprentice member who writes the best report on the excursions and demonstrations. Reports must be handed to the Secretary, Mr. George Sinclair, 144A, Princes Street, Edinburgh, not later than October 1, 1895.

COD-LIVER OIL EMULSION.—In the Edinburgh Sheriff Court on May 22, Sheriff Rutherford closed the record in an action by David Middleton, chemist and druggist, 85, Bruntsfield Place, against J. M. Wilson and Co., chemists, 16, Lyon Street, for £20 for damages in his business and reputation by the alleged wrongful conduct of the defendants, and also for interdict. The pursuer states that he has made a "Cod-liver Oil Emulsion," the secret of which is known to him alone, and avers that the defendants have been making a practice of substituting some other preparation than that of the pursuer in dispensing prescriptions ordering his emulsion. The defendants
reply that they have never, until the present occasion, assoe, heard of the purser’s preparation, and explain that nearly every chemist in the country has his own mode of preparing cod-liver oil for use. They admit that a boy called at the shop and presented a slip of paper containing a request for a bottle of Middleton’s Cod-liver Oil Emulsion, but he was told they had no such preparation in their possession, though they could supply him with a bottle of cod-liver oil emulsion of their own preparation. The boy accepted the offer, and it was supplied.

EDINBURGH PHARMACY ATHLETIC CLUB.—The fourth annual sports were held at the Powderhall Grounds on Tuesday, May 23, at 8.45 p.m. These sports have now taken an important place in the Scotch athletic world, and there was a very large attendance of the public and a representative turn out of Scotch athletes. The weather was perfect. The following is the prize-list:—Putting the ball (confined), Mr. G. F. Anderson, 150 yards handicap (open), 1, A. R. Downer, time 15 seconds, thereby breaking the Scotch record of 15½ seconds; 2, P. G. Sheashe, 300 yards flat race, handicap (confined to apprentices), 1, W. B. Henry; 2, J. M. Foutte. 120 yards flat race, handicap (open), 1, J. K. Bellantyne; 2, J. H. Halliday, 3, J. M. Harper. Half mile handicap (confinned), 1, J. T. Gibb; 2, J. Hogg. One mile bicycle race (confined), 1, H. L. Corder; 2, D. Foula. 220 yards flat race, handicap (confined), 1, W. B. Henry; 2, J. P. Gibb. Quarter mile handicap (open), 1, M. C. C. Seton; 2, T. K. Fair. One mile flat race, handicap (open), 1, J. Sarton; 2, J. F. Henry. The prizes were presented by Miss Gibb, and Mr. David MacIver presented, and congratulated the Club on their marked success. Among the judges were Messrs. D. B. Dott and George O’Neill, and prizes were given by W. A. Davies, Duncan, Flockhart and Co., J. P. Mackian and Co., D. MacIver; Maw, Son, and Thompson; Balmes, Clark, and Co.; and Thomas Walsh. Much credit is due to the Hon. Sec., J. P. Gibb, for the very complete arrangements.

Irish News.

ROYAL DUBLIN SOCIETY.—At the usual monthly scientific meeting of the Royal Dublin Society, on May 22, Mr. W. E. Adeney read a paper on “The Chemical Examination of Organic Matter in River Water,” in which he referred to the fermentative changes in the constituent parts of river water, and said they consisted chiefly of the breaking down of the organic matter and the conversion of carbon into oxygen and of the nitrogen into ammonia. By observing these fermentative changes it would be seen that they at once showed the very great power they gave to the chemist to differentiate between the many different kinds of organic matter that occur in river water such as could not be afforded by ordinary methods. Professor Reynolds then communicated a paper on “The Spectrum of Argon,” and Mr. R. J. Mose afterwards read a paper on “The Preparation of Helium.” He described experiments which he had recently conducted with the new gas, and stated that some thirty years ago a line was observed in the chromosphere and prominences of the sun, which, upon careful investigation, could not be assigned to any known element. All the other lines of the chromosphere and prominences were easily recognised as corresponding to those of known terrestrial elements. A hypothetical element called helium was brought on account for the line. A few years ago Mr. Hildebrand announced that a mineral known as a cleavelite contained a gas which he considered he had proved conclusively to be nitrogen. Professor Ramsay recently undertook the further investigation of this gas, and found that it contained very little nitrogen, but consisted chiefly of argon and helium. The gas was obtained both by ignition in vacuo and by the action of acids, and the nitrogen it contained was removed by the long-continued action of an electric spark in the presence of an alkali. The gas was then removed by the aid of the springed mercury pump to a nearly perfect vacuum. A bottle of about three to ten millimetres of mercury about one or two hundredths of the atmospheric pressure, the gas exhibited a brilliant spectrum when rendered incandescent by the current from an induction coil, and in this spectrum the third or helium line became conspicuous.

LAMP EXPLOSIONS.—Lamp oil has led of late, either directly or indirectly, to a large number of fatalities in Belfast. There have been a series of inquiries in connection with deaths which have resulted from the explosion of lamps. The City Coroner has already drawn public attention to the matter. Another death occurred on the past day. There has been a great deal said about the improper construction of the lamps, and the subject is one demanding the immediate attention of lamp manufacturers. Even where excellent gas and the brilliant electric light can be obtained there are people who will still adhere to the more primitive and, as they believe, much safer methods of obtaining illumination from either the candle or oil.

DYNAMITE EXPLOSION.—In Bangor, County Down, one of the most popular and also most populous seaside resorts in the north of Ireland, there was a serious dynamite explosion on Monday last. A new pier is being constructed, and it was in connection with the works being there carried out that the explosion occurred. Happily no person was injured, but Dr. Moore and one of his children, who were on his lawn at the time, had a very narrow escape, and the doctor’s residence is damaged very extensively. A little later in the day and the roads adjacent to the place would have been crowded.

APOTHECARIES’ HALL BANQUET.—Professor Tichborne, governor of the Apothecaries’ Hall, gave an address to the medical profession on Monday, May 23, at his residence, North Great Georges’ Street, Dublin. Amongst others the following were present:—The Lord Mayor, the Provost of Trinity College, the Presidents of the Colleges of Physicians and Surgeons, the President of the Academy of Medicine, the President of the Pharmaceutical Society of Ireland, Sir Charles Cameron, Dr. Emerson Reynolds, etc. The vise-chair was occupied by Sir Robert Jackson, K.C.B., Deputy Governor. After the usual loyal toasts the toast of the Royal College of Physicians and the Royal College of Surgeons were duly given, and responded to by the President, Sir William Stokes and Professor Emerson. Remarks were then made by appropriate speeches on behalf of the medical schools of Dublin. The health of the Governor was proposed by Dr. J. Little, President of the Academy of Medicine.

SNAKE-BITE has been successfully treated with chlorides of lime in the case of a man, thirty years old (Austral Med. J.). A whip snake bit him on the middle joint of the left fore-finger, and the effects were soon seen in dilation of the pupils, varying from full to almost complete. The latter was five times the size of the former, and persisted. Hydrogen peroxide and pepsin were used to soften the skin. The wound was washed with lime (1 in 60) was injected into the hand and elsewhere within two hours of the bite, and aromatic spirit of ammonia administered, followed by morphine later when the pain was acute. At the end of ten days the patient had recovered.
身邊的 News.

PRESCRIBING FOR STATUS.—If a chemist may prescribe for human diseases, remarks the Pall Mall Gazette, there is no reason why he should not prescribe those of a status, and this is what an Apothecary-man at Cassel has attempted with wonderful results: Spohr, the musician, died at Cassel in 1859, and his monument is with us to this day. A fine bronze monument, but one which has lately needed washing. A young patient living in his house was commissioned to carry the water to him; but feeling that some other were hardly up to the level of the occasion, he consulted a local chemist. “Try hydrochloric acid,” was the chemist’s advice, and Spohr was freely sprinkled and rubbed down with the corrosive the same day. The next morning the statue was as green as an image of Eury or Homeric fear; it had developed a fine rain of verdigris during the night, nor could the authorities at first conjecture what new form of sporadic (or Spohradic) disease had produced the strange transformation. The green statue of Cassel is said to be a great aesthetic success, and is attracting crowds of spectators every day.

TELEPHONE INDUCTION SIGNALS.—Mr. Prece, the electrical engineer of the General Post Office, lectured last week to the members of the London Chamber of Commerce in the Great Hall of the Carpenters’ Company, and described how the cable connecting the Isle of Mull with the mainland at Oban was broken in March last. Before the cable ship came round to make repairs communication by induction was accomplished. The width of the channel at the points selected from the inductive circuit varies from one to a quarter to two miles. Skirting the coast of the island an overhead wire exists between Craigmuir and Aros, in a position well adapted to the object in view, the distance between this wire and the mainland being almost uniformly two miles. As there were no existing wires on the mainland parallel with the Craigmuir and Aros wire, a gutta-percha insulated wire was laid along the ground from Mornie in a north-westerly direction, for about a mile and a half. It was earthed at Mornie in a running stream, a mile away from the sea, and at the other end it was earthed in the sea itself. The wire joined up for the inductive circuit was too short and the resistance of the circuit too great, and a division was made at a point exactly opposite the termination of the Mornie gutta-percha wire. Until this was done satisfactory communications could not be established. The traffic actually dealt with by this arrangement between March 30 and April 3 was nearly 1,000 messages and a Press message of 120 words. By this time the repairs of the cable were completed. The Mull operations were illustrated by a very fine wire on each side of the room, and the messages, inaudible to the natural ear, transmitted along one wire were read by telephones, by the audience after the lecture.

AN AUTOMATIC DOCTOR.—The most remarkable automatic machine, according to the Reporter’s Magazine, is “The Doctor Cure-all,” in a town in Holland. It is a wooden figure of a man with compartments over the body, labelled with the names of the various ailments. If you have a pain, find its corresponding location on the figure, drop a coin in the slot and the proper pill or powder will come out.

KUMYIZON is a variety of kymyz made from sterilised milk, without the addition of cane sugar, and may be kept almost indefinitely without change (Mod. Med., April). It is said, therefore, to be practically free from alcohol and acetic acid. The lactic acid fermentation is induced by means of a special ferment.

Poisoning Cases and Inquests.

Strychnine.—James Sherrin, aged 55, died on Tuesday, May 14, at 127, Dover Road, Northfleet, from the effects of strychnine contained in a packet of “Battle’s Yermin Killer.” Self-administered. Verdict: “Suicide during temporary insanity.”

Laudanum.—James Carroll, aged 33, died on Saturday, May 18, at Mansfield Road, Torry, Aberdeen, from the effects of an overdose of laudanum.

Carbolic acid.—Maria Whitehead, aged 16, died on Thursday, May 16, in the Infirmary at Northampton, from the effects of carbolic acid, self-administered. Verdict: “Suicide whilst in an unsound state of mind.”

Arsenic.—Emma Creed, aged 71, died on Tuesday, May 21, at Minworth, near Sutton Coldfield, from the effects of arsenic contained in a weed killer, taken in mistake for paradigm. Verdict: “Poisoning by misadventure.”

Phosphorus.—Charles Smith Milne, aged 8, died on Tuesday, May 21, at Woodside, from the effects of sucking matches containing phosphorus.

Opium.—James William Bush, aged 58, died on Monday, May 20, at Yarmouth, from the effects of opium, self-administered. Verdict: “Death from misadventure, through taking an overdose of opium.”

Carbolic Acid.—Henry Blunt, aged 22, of 30, Queen Anne Road, Maidstone, died on Wednesday, May 22, at Dover from the effects of carbolic acid, self-administered. Verdict: “Suicide.”

Prussic Acid.—Harry Pike, aged 48, died on the way to the Westminster Hospital, London, from the effects of prussic acid, self-administered. At the inquest held on Friday, May 24, a verdict of “Suicide while temporarily insane,” was returned.

Laudanum.—George Holford, aged 79, died on Wednesday, May 22, at Newark, from the effects of laudanum, self-administered. Verdict: “Suicide while in an unsound condition of mind.” In reply to a juror, the coroner stated that a person could purchase nearly any quantity of laudanum, as it came under the second schedule in the Poisons Act. He thought that in any amendment of that Act laudanum should be included in a schedule which would make it much more difficult to obtain than at present. The jury agreed with the coroner that there was some need for an amendment of the law.

Carbolic Acid.—Ada Louise Gidden, aged 28, died on Thursday, May 23, at 39, Hamilton Road, Wimbi- don, from the effects of carbolic acid, self-administered. Verdict: “Suicide during temporary insanity.”

Carbolic Acid.—James Chariton, aged 4, died on Sunday, May 26, at 190, Palmerston Street, South Shields, from the effects of swallowing carbolic acid. Verdict: “Accidentally poisoned by drinking carbolic acid.”

Vitriol.—Mary Mehern, aged 35, died on Sunday, May 19, in the Stockton Workhouse, from the effects of vitriol, taken in mistake for glycerin for a cold. Verdict: “Death from misadventure.”
Extracting Zinc from Ores, etc. (Hoepfner, C.)—Zinc is obtained from native or other zinc carbonate by heating it in the form of powder, and preferably at high pressure, with a strong solution of calcium chloride. The resulting zinc chloride which remains in the solution, is decomposed electrolytically to precipitate the bulk of the zinc as metal, but the last portion of the zinc which decomposes in air whilst precipitated as hydrate by means of slaked lime. No. 11,724 of 1894.

Mandate of Antipyrine (Imray, O., communicated from the Farwerkes, formerly Meister Lucas and Brüning).—This compound, whose therapeutic use is not stated, is prepared by dissolving together in alcohol, benzene or other solvent, 186 parts of antipyrine and 152 parts of mandelic acid, and evaporating off the solvent. The colourless syrup which remains gradually solidifies to a hard crystalline mass, having a fusing point of 52° C. This salt is "soluble in nearly all solvents," and is separated into its constituents by acids and alkalis. No. 11,774 of 1894.

Chlorine (Brock, J., Driffeld, V. C., Carey, A., and Oggi, C.).—Refers to three inventions, Nos. 11,939 to 11,968 of 1894, for the manufacture of chlorine by the "Descon" process, in which hydrochloric acid gas and air are caused to react in admixture by exposure to a large surface of inert porous "catalytic" material. The first patent consists in causing the mixed gases to pass successively through two walls or surfaces of the porous material to ensure complete reaction. The second comprises means for regularly withdrawing the porous material from the bottom of the mass, as it loses its power, while keeping up the supply at the top, and the third comprises means for keeping the heat of the mass uniform, or for rendering the lower portion hotter when required. Nos. 11,968 to 11,988 of 1894.

Potassium and Sodium Cyanides (Castner, H. Y.).—The invention consists in allowing molten potassium or sodium to flow into a red hot retort preferably charged with wood charcoal, through which nitrogen, free from oxygen or oxygen compounds, is slowly ascending. The metal combines with the carbon of the nitrogen, the cyanide produced flows out through a tube at the bottom of the retort. No. 12,218 of 1894.

Potassium and Sodium Cyanides (Castner, H. Y.).—This invention corresponds with the above, ammonia gas being substituted for the nitrogen. The carbon may be replaced by fragments of iron, porcelain, or other inert material, gaseous hydrocarbons being passed into the retort together with the ammonia. No. 12,219 of 1895.

Acetylene (Lake, H. H., communicated from Dickerson, E. N., and Suckert, J. J.).—The gas is produced from the carbide of calcium, potassium, or other metal by the action of water. The process is made continuous, the gas being dried by passing over a surface which is not being treated with water, and condensed by the pressure produced by its generation. The inventors state that when the condenser is cooled to 56° F. liquefaction occurs at 455 lbs. pressure; half to 68° F. a pressure of 610 lbs. is required. No. 5730 of 1895.

The March exports of rubber from Para amounted to 10,682,757 lbs., of which 557,547 kilos came from Marajos. Of the total, 1,412,756 kilos were exported to the United States and 546,894 kilos to Europe.

Trade Marks Applied For.

No. 185,461.—CHEMICAL SUBSTANCES used in manufactures or philosophical research and anti-corrosives, but not including varnishes and paints, mineral dyes, pigments, and artistic colours, and not including any goods of all kinds and to any of these excluded goods.—William Ewing and Co., 7, Royal Bank Place, Glasgow. February 9, 1895. Device: A monkey and the words "Monkey Brand.

No. 186,600.—PREPARATIONS FOR THE HAIR, SKIN, and teeth, and perfumed soap, all included in class 48. John Stuart Collins, 82, High Street, Galashiels, Scotland. March 29, 1895. Word: "Keora."

Hayward.—On May 14, William Griffin Hayward, Pharmaceutical Chemist, Reading. (Aged 74.) Mr. Hayward went to Reading in 1848, carrying on his business in Bridge Street, which he retained until his retirement in 1890. He was the first clerk to the "New Reading Gas Company," and afterwards one of the two collectors. Mr. Hayward recently joined the Board of Directors of the Reading Gas Company. He served for twenty-two years as a Guardian of the Poor, and for one year the Chairman of that body. He was actively connected with the Dispensary, the Savings' Bank, the Charity Organisation Society, and other undertakings for the good of the people. The Volunteer movement also had his active support, he being enrolled in the Reading Rifle Corps in July, 1859, retiring in 1880. He was a staunch supporter of the Liberal cause, and was for some time Secretary of the Reading Liberal Association.

Clarke.—On May 22, Thomas Clarke, Chemist and Druggist, Stockport. (Aged 65.) Mr. Clarke had been a member of the Pharmaceutical Society since 1872.

Spenner.—On May 28, William Henry Spenner, Pharmaceutical Chemist, Journam Market, Norfolk. (Aged 81.) Mr. Spenner had been a member of the Pharmaceutical Society since 1853, and had been in business for half a century.

Chimaphilin, a crystalline neutral principle from Chimaphila umbellata, Nuttall, and C. maculata, Pursh, is shown by Ridenour (Am. Journ. Pharm.), to form a chlorine derivative in light yellow needle-shaped crystals, and a bromine derivative in tabular crystals, which decomposes in the cold, and to form, when treated with nitric acid, acetic acid on to it, to form a nitro-derivative of an oxidation product of chimaphilin, in lemon-yellow tabular crystals.
New Remedies.

[The notes given under this heading for the information of dispensers, embody recent suggestions in therapeutics, and cover both new drugs and preparations, and old ones under new aspects. The word "parts" is used to represent parts by weight, both for solids and liquids.]

APPLICATION FOR MULTIPLE WARTS.—Kaposi recommends flowers of sulphur, 10 parts; glycerin, 25 parts; glacial acetic acid, 5 parts. Mix. A daily application is made to the wart-covered spot, when the excrescences shrivel up gradually and finally drop off. The bottle should be well shaken before each application (L'Union Pharm., xxxvi., 209, after Moniteur Thérap.).

BROMIDE OF STRONTIUM IN EPILEPSY.—At the meeting of the Medical and Scientific Society of the Catholic University, Dublin, Dr. Roche recorded his favourable experience of bromide of strontium, which he finds more beneficial than the other bromides, although in some cases it is preferable to give both potassium and strontium bromide together; an average dose for an adult is 10 grains three times a day, either alone or in equal quantity of the potassium salt (Brit. Med. Journ., 1895, 1089).

ETHYL-CARBONATE OF PARACETAMOL-PHENOL.—This substance, which forms a colourless crystalline powder, soluble in alcohol, slightly soluble in water, was found by Treupei to possess an antipyretic, analgesic, and hypnotic properties. It lowers febrile temperature two or three degrees, and is efficacious in cephalalgia and neuralgia, the analgesic action being evident in half an hour. The dose is 50 centigrammes (Rapport de Pharm. [3], vii., 220).

POWDERED GALLS IN THE TREATMENT OF BURNS.—Dr. Grosse finds the application of an ointment composed of 1 part of powdered galls with 8 parts of boracic acid ointment, an excellent means of diminishing the discharge and disinfecting the wound, so as to promote rapid cicatrisation (Rev. de Thérap., April, 1895).

BROMIDE OF GOLD IN ECZEMA, ETC.—Dr. Ohmann Damesnöf finds gold bromide an excellent adjuvant of mercury or arsenic in the treatment of chronic eczema or obstinate syphilitic skin affections. He has found cases which remained intractable to arsenical or mercury treatment alone, which have been speedily cured by the association of gold bromide with these metals.

INTRA-PARENCHYMATOUS INJECTION OF B-NAPHTHOL IN TUBERCULOSIS.—Dr. Fermot injects 50 centigrammes of the following mixture, which in each dose contains 6 milligrammes of b-naphtol:—Precipitated b-naphtohol, 40 centigrammes; gum tragacanth, 20 centigrammes; distilled water, 20 grammes (La Semaine Méd., April 3, 1895).

CALCUM BORATE.—This salt, which exists as a white powder, soluble in solutions of calcium chloride or of borax, may be used, according to Dr. Alberto, with advantage in the form of ointment in the treatment of burns, moist eczema, and fistula perspiration. Internally it is said to be an excellent antidiarrhoeic and may be administered as follows:—For external use, borate of calcium 5 parts; iodine, 20 parts; balsem of Peru, 1 part. Mix. Internally, borate of calcium, 50 centigrammes; powdered sale, 20 centigrammes; sugar, 30 centigrammes. A child of five years of age may take three or four powders daily. Speaking generally, the dose of borate of calcium in such powders should be as many decigrammes as the child is years old.

PEROXIDE OF HYDROGEN IN DIPHTHERIA.—Dr. Navratil administers a mixture of hydrogen peroxide internally in diphtheria. This treatment has the advantage of preserving the unaffected parts in a normal condition for several days, and it has no bad effect on the patient's system, even in the case of young children after prolonged use, and the diseased parts are allowed to remain in a perfectly quiescent state. The formula employed is peroxide of hydrogen, 60 parts; glycerin, 15 parts; distilled water, 235 parts. To be taken with a teaspoonful to be taken every quarter of an hour without interruption day and night. Over three hundred cases have been treated by this method with good results. The earlier it is commenced the better chance there is of success (Wien. Med. Wochenscr., after Thérap. Monatschr., April, 1895).

TREATMENT OF SMOKERS' GINGIVITIS.—Vian employs salol, 1 part; spirit of peppermint, 100 parts; tinct. catechu, 4 parts. A teaspoonful in half a tumblerful of warm water to be used as a mouth-wash (Thérap. Monatschr., April, 1895).

FORMS OF EXHIBITING CHLORAL HYDRAZE EXTERNALLY.—For cutaneous pruritus—chloral hydrate and carbolic acid, of each, 1 part; olive oil to 100 parts; the liniment to be rubbed on the itching part. For toothache—chloral hydrate, camphor, carbolic acid, and glycerin, of each equal parts. A piece of wadding saturated with this mixture to be placed in the cavity of the tooth. For earache—similar to last, substituting castor oil for the glycerin. Warm the mixture and drop a few drops into the ear. For acute coryza—chloral hydrate, 1 part; castor oil, 3 parts. To be painted inside the nose, which must first be freed from secretion (Brodnax, in Sem. Medicale).

SALICENIN IN RHEUMATISM AND GOUT.—Lederer having succeeded in producing salicenin synthetically from phenol and formaldehyde, this body has become available for therapeutic use. It has been tried with success in eight cases, seven of acute rheumatism and one of gout, with good effects. No bad effects were produced by giving doses of 1/2 to 1 gramme every one or two hours, either in powder or in dilute alcoholic solution thus:—Salicenin, 4 parts; spirit, 30 parts; distilled water to 200 parts. One to two teaspoonfuls every hour (Münch. Med. Woche., after Thérap. Monatschr., April, 1895).

BROMALINE AS A SUBSTITUTE FOR METALLIC BROMIDES.—Laquer gives results obtained in the treatment of epilepsy and other nervous affections treated by bromethylformine (bromaline), and arrives at the conclusion that it possesses marked advantages over the alkaline bromides, since it does not provoke furunculosis or give rise to fetid breath, or other undesirable symptoms. Bromaline is very soluble in water, and free from the disagreeable odour of bromide of potassium. For children it may be prescribed as follows:—Bromaline, 10 parts; distilled water, 10 parts; syrup of orange, 30 parts; a dessertspoonful for a dose once or twice daily. Adults may take from 2 to 8 grammes of bromaline per diem (Rev. Int. de Med. et de Chir., 1895, p. 165).

ADMINISTRATION OF TRIGONAL.—This remedy is prescribed by Dr. Gallais. In doses of 1 gramme daily in unleavened bread to avoid the nauseous taste of the drug. A few cases are refractory to its influence, but generally sleep is produced in twenty-five minutes, and lasts almost all night. Since it appears to be purely hypnotic in its action, the author considers it specially indicated in neurasthenic cases (Univers. Med. Journ., new ser., vol. iii., p. 101).
Notes and Queries.

[The information given in this column includes both notes of practical interest to pharmacists, and replies to queries which seem to possess sufficient interest to readers generally.]

COLOUR REACTION FOR COD-LIVER OIL.

[872.] According to Rössler, when 5 parts of genuine cod-liver oil are shaken in a test tube with 3 parts of freshly prepared aqua regia, at the end of eight minutes there is formed at the juncture of the liquids a series of greenish rings passing to brownish violet. Inferior oils give either a very slight reaction or none at all (Prager Rundschau).

NUTRIENT MEDIUM FOR MICROBES IN WATER.

[873.] Dr. Lanarelle recommends the following:—Gelatin, 20 parts; dry peptone, 10 parts; sodium chloride, 10 parts; potash nitrate, 1 part; distilled (sterilised) water sufficient to make 100 fluid parts. This may be preserved in sterilised bottles: for use add 10 C.c. of this solution to 100 C.c. of the water; this will give a nutrient medium containing gelatin, 2 grammes, peptone, 1 grammes (Mod. Medic., Jan., 1895).

MASKING THE BITTER TASTE OF QUININE.

[874.] Dr. Lemanski, of Tunis, states that of all the various methods of disguising the bitter taste of quinine salts, he has found none to excel that of adding the prescribed dose to a cup of coffee, slightly fortified with a little cognac or any other alcoholic beverage. This means has been effective in overcoming the repugnance of labourers working in malarial regions to the medicinal doses of quinine which the authorities issued to them, and therefore insured a greater chance of the dose being properly taken. Other observers have reported very favourably of the excellence and convenience of the method. The hydrochlorate of quinine is to be preferred to the more frequently used sulphate, since it appears less frequently to give rise to digestive disturbances (Rev. Internat. de Méd. et de Chir. Prat., April 10).

PASTILLS OF PHOSPHORUS.

[875.] Persons suffering from paralysis will be well served by pastilles of phosphorus thus: An accurately weighed quantity of phosphorus is dissolved in an accurately weighed amount of cocoanut oil and the solution filtered. The fatty solution of phosphorus is then worked into a paste by adding to it cocoanut powder free from fat; it is then rolled into pastilles so as to contain a definite weight of phosphorus. These pastilles are then varnished with oint, and after drying, dipped into liquid chocolate. Care must be taken to keep them from the reach of children (Pharm. Centralblatt, April 25, 1895).

FORMULÉ FOR DISPENSING ALUMINUM.

[876.] (1), in the pure state as a dusting powder for veneral sore; (2), mixed with 80 to 80 per cent. of French chalk for burns; (3), in 14 per cent. solutions for washing excoriations, acne or sebaceous surfaces; (4), in 2 to 10 per cent. alcoholic solution for urticaea, syphilis, etc.; (5), as an ointment, alumín, 10 parts; hard paraffin, 6 parts; liquid vaseline oil, 35 parts; glycerine wet-fat, 60 parts; (6), as a colloid, cucurbit, 50 parts; hard paraffin, 20 parts; alumín, 18 parts (Les Nouveaux Remèdes, Jan., 1895).

IMPROVED FORMULA FOR CHLOROFORM OINTMENT.

[877.] Chloroform, 10 parts; hard paraffin, 5 parts; vaseline, 85 parts. Melt the paraffin with a gentle heat, then almost cold add the chloroform gradually and triturate rapidly in a mortar. The product should be preserved in a hermetically sealed vessel (Crousset L'Union Pharmaceutique, March 3, 1895).

Notices, Letters, and Answers to Correspondents.

COMMUNICATIONS FOR THE CURRENT WEEK'S JOURNAL SHOULD REACH THE OFFICE, 37, BLOOMSBURY SQUARE, LONDON, W.C., ADDRESSED "EDITOR," NOT LATER THAN THE FIRST POST OF THE MORNING. TELEGRAMS MAY BE RECEIVED ON THE SAME MORNING. TELEGRAPH ADDRESS: "PHARMACEUTICAL JOURNAL, LONDON."

ADVERTISEMENTS (except for the "EXCHANGE" column), orders for copies of the Journal, remittances from abroad, respecting transmission of samples, should not be addressed to the Editor, or delay will be caused. See directions on the front page.

CORRESPONDENTS who wish to be taken of their communications must write in on one side of the paper only, and not on both sides of the matter, with their names and addresses not necessarily for publication. No notice can be taken of anonymous communications.

Minor Correspondence will be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

* * * Queries should be addressed "Editor," and will be replied to in an early as possible after receipt, answers of sufficient general interest being given under the heading NOTA AND QUERIES.

LETTERS.

THE NEW COUNCIL.—Mr. James S. Prior, of Melba Mount, thinks a new era is commencing in pharmaceutical politics, and that it behoves every chemist to be better acquainted with the coming events as they affect the medicine in the shops. He wants a Council which has the courage to face its convictions, with a little British pluck and perseverence. Past Councils, composed of excellent men, have, he thinks, done too little, according to this critic who hopes "the new Council will rise en masse and not be Vue et pratiquer avec reconnaissance, but introduce into Parliament, and pass by the people, a Bill for a Preliminary Examination, so that we may have a sensible Preliminary instead of the present farce. 2nd. Enforcing a compulsory attendance to a stated number of lectures, etc., before presentation for the Minor examination. These alterations may seem as.

ANSWERS.

A. MIDDLETON.—The copy returned was perfect, but wrongly folded. Another has been sent.

S. R. (of Leyden).—The manufacturing for alkali is made by mixing liquor bismuthi, B.P. 1 oz.; potassium iodide, 90 grs.; strong hydrochloric acid, 90 grs. It forms an orange-coloured solution, which gives red precipitate with dilute solutions of the salt.

FILDREY'S REAGENT is prepared by dissolving molybdate acid or ammonium molybdate, 5 Mgs., in strong sulphuric acid, 1 C.c. It is one of the most useful oxidation tests for alkali.

L. V. VOIS.—We take it that the ordinary kiln-dried variety is meant.

PENDLEBURY.—Messrs. Beisendorf and Co., of Altona, Germany, are the patentees and manufacturers of the preparation. You ought to be able to procure it through any first-class firm of wholesale druggists.

COMMUNICATIONS, LETTERS, ETC., have also been received from Messrs. Barnes, Grimshaw, Hill, Holding, Kemp, Newbery, Nightingale, Sinclair, Stark, White.
THE CHEMICAL HISTORY OF ACONITINE.*
A REPLY TO DR. MARTIN FREUND.
BY PROFESSOR W. R. DUNSTAN AND F. H. CARR.
We are unwilling to enter again into a discussion of priority of Messrs. Freund and Beck as to the establishment of the new view of the constitution of aconitine, but the fresh reply to our claim which Herr Freund (1895, xxvii, 192) made at the tape of a year, has been led to make, renders it necessary for us to call attention to the facts of the case.

In the Proceedings of this Society recording the meeting of January 18, 1894, three short papers of ours were printed to which Herr Freund has made very misleading references. The first proves that the alkaloid obtained by Wight from aconite root, and called "Pieraconitine," is not a pure substance, but consists chiefly of "Isaconitine," which we had previously shown to be benzoacetic acid (Trans., 1893, lixii, 448). The second paper shows that when aconitine is heated at its melting point it loses one molecular portion of acetic acid, forming a new alkaloid, pyraconitine. The third paper proves that acetic acid is formed, both whenaconitine is converted into "isaconitine" by heating its salts with water, and also when aconitine is completely hydrolysed with formation of aconine, and, therefore, that it is probable the acetyl group of aconitine may be separated under both these conditions. Now the percentages of carbon and hydrogen in "isaconitine" represented by the old formula $C_{3}H_{4}NO_{3}$, or by the new formula $C_{2}H_{4}NO_{3}$, and also in aconine, using the two corresponding formulae $C_{6}H_{4}NO_{3}$ and $C_{6}H_{4}NO_{3}$ are so nearly the same that no proof as to the separation of one acetyl group from aconitine could not be obtained from the results of the ultimate analysis of these products; the elimination of the acetyl group making but little difference in the percentage composition.

Benaconitine.

$C_{3}H_{4}NO_{3}$ (old formula) $C = 61.20; H = 8.95$. $C_{2}H_{4}NO_{3}$ (new formula) $C = 61.48; H = 7.10$.

Aconitine.

$C_{6}H_{4}NO_{3}$ (old formula) $C = 57.46; H = 7.65$. $C_{6}H_{4}NO_{3}$ (new formula) $C = 57.48; H = 7.78$.

The required proof, however, could be gained by estimating accurately the proportion of acetic acid separated in these changes. Now, on attempting to estimate exactly the quantity of acetic acid formed under these conditions, we met with unexpected difficulties, so that, at the time these short papers were written, quantitative estimations of the desired degree of accuracy had not been made. On account, we were unable to do more than indicate the nature of the conclusions at which we had arrived, and, for the same reason, we were obliged to retain the old formula for "isaconitine" in the first paper. To have done otherwise would have been to anticipate the proof which could only be gained by exact quantitative determinations of acetic acid not at the close of the third paper that if this view "should prove to be correct the nomenclature and formula of aconitine derivatives will need entire revision."

Wishing to complete this proof by making the necessary determinations of acetic acid, we only presented to the Society two full papers for the Transactions, holding over the third until these determinations had been made. In about a fortnight these estimations were finished, and they proved that exactly one molecular portion of acetic acid separates when aconitine changes into "isaconitine" or into aconine. Therefore, aconitine must be, as we had indicated in our third short paper, mentioned above as published in the Proceedings, an acetyl derivative which loses its acetyl group under these conditions.

The Berichte issued from Berlin on February 19, 1894 (p. 433), contained a short paper by Messrs. Freund and Beck, their first contribution to the literature of aconitine, in which they stated that aconitine yields acetic acid on hydrolysis, but gave no estimations of the amount of acetic acid formed, or, indeed, any experimental proof of their assertion that aconitine is acetylbonezoaconitine. That they had seen our papers in the Proceedings is evident, from the fact that they actually quote from the first on "pieraconitine," although they entirely ignore the two following papers, which not only contain the conclusion they bring forward, but also supply experimental evidence of its truth. This proceeding seemed to us so unfair that we at once sent to the President of the Society a statement of our quantitative determinations, at the same time drawing his attention to the paper of Messrs. Freund and Beck. The President directed that this statement should be included in the March number of the Journal (1894), then passing through the press, in which the first two papers had already been printed. This third paper contains the only complete proof which has hitherto been adduced, that aconitine is acetylbonezoaconitine, and it will be seen that it furnishes the results of estimations of acetic acid which, it was stated in our short paper published in the Proceedings nearly two months before, were in the process of being made.

At the same time we sent to the German Chemical Society a statement of our claim for priority, which was printed in the Berichte of March 19, 1894 (p. 664). In his first reply to this statement, Herr Freund (Ber., 1894, xxvii, 720) attempts to justify the absence of any allusion by him to our short papers in the Proceedings, on the ground that the production of acetic acid had already been observed by other people, but not by Messrs. Ehrenberg and Purfist in 1893, and that the work of these observers formed the basis of his inquiry.

Now Ehrenberg and Purfist had boiled aconi-

---

* Having looked into the facts of the case this course had my entire approval.—EDITORS, Journ. Chem. Soc.
† Herr Freund states that he has not replied until now (Ber., xxv, Feb., 1896, p. 193), but a reference to his paper in the Berichte of March 19, 1894, will show that the excuse he makes is wanting in accuracy.
time with water, and stated that they had identified in the product benzoic acid; methyl alcohol; an acid, probably acetic acid; probably formic acid, together with the alkaloids named (but neither described nor analysed) "picraconitine" and "napelline." They conclude, without quantitative proof, that aconitine first loses benzoic acid, forming picraconitine, then that picraconitine loses methyl alcohol, forming napelline, and, lastly, that napelline loses acetic acid, forming aconine. Meares, Freund and Beck profess that it is manifestly erroneous observations and conclusions which have led them to the very different result that aconitine is acetylbenzoylacetic, and that it loses acetic acid but not benzoic acid, forming "picraconitine." As a matter of fact, they reject every observation and conclusion arrived at by Ehrenberg and Purfurst, except the suggestion that acetic acid is probably a product of the decomposition of aconitine; that it is so was proved for the first time by us, and is true bearing in mind in our two short papers; to these, Meares, Freund and Beck do not even refer, although they were published more than a month before.

With this plain statement of the facts of the case we can confidently uphold our claim to priority against Herr Freund's criticism.

Meares, Freund and Beck have proposed to alter to C₃H₅N₂O₄ the formula of aconitine which we give as C₄H₅N₂O₄, and Herr Freund professes to be aggrieved that we have not so far considered his proposal. As a matter of fact, any discussion at the present time as to the exact formula of aconitine must be futile, as, until simpler derivatives of aconitine have been prepared and analysed, the question must remain, to a large extent, an open one. At the same time, we may state that analyses of the aconitine derivatives recently prepared by us do not furnish any ground for adopting the formula which Herr Freund has prematurely advanced; on the contrary, they lead us to prefer that long ago proposed by ourselves (see Proc., February 18, 1895). This will be made clear by an inspection of the following table:

* It will be evident that our new formula for benzoconine, C₃H₅N₂O₄, which Herr Freund asserts is based solely on the analysis of the aurichlor-derivative (the existence of which, by the way, he denies), rests chiefly

Meares, Freund and Beck have also attempted to show that the isomeric forms of aconitine aurichlorides, as well as aurichlorbenzoconine, described by one of us and Mr. H. A. D. Jowett (Trans., 1894), do not exist, but it has been shown (Proc., February 18, 1895), by a re-examination of these compounds, that our original observations are correct.

THE STUDY OF MATERIA MEDICA.

The following suggestions concerning the work that may be done in materia medica or pharmacognosy proper during apprenticeship, and how to do it, are given with the hope that they may prove useful to intending students.

Pharmacognosy, or the recognition of vegetable and animal drugs, may be divided into two sections. The first includes the recognition of drugs by such characters as may be seen under a lens, or may be ascertained by the senses of sight, touch, smell, and taste. The second deals with crude drugs in powder, and includes the examination of drugs under the microscope and the recognition of the tissues that are characteristic of each. This more properly comes under vegetable histology.

Starting with the assumption that an apprentice ought to become fully acquainted with the materials used in his business, we find that there are about 166 crude vegetable and animal products official in the British Pharmacopoeia; adding to these sixty-four not in the B.P., but of which a knowledge is required, and about fifty others regularly occurring in wholesale drug lists, and therefore evidently more or less in demand in trade, we have a total of 280.

It may be supposed that a study of botany, so far as the parts of a plant are concerned, has preceded the study of materia medica. In other words, the second year of apprenticeship may conveniently be given to materia medica, the study of which should be commenced with a few axioms deeply impressed on the mind:

1. That there are no two drugs exactly similar in every respect. Each distinct species of plant differs in macroscopical as well as in microscopical and physical characters.

2. That some characteristics are, to a certain extent, common to certain groups of plants, such as milky juice in the Apocynaceae, etc., and oil receptacles in the leaves of the Myrtaceae and Rutaceae.

3. That diagnostic characters are best seen by comparison, hence the various products are advantageously studied in groups, as indicated in the official list of materia medica in the syllabus of the examinations.

4. Samples of drugs obtained at different times or from different geographical and commercial sources vary considerably in appearance and value.

5. No feature should be considered to be a diagnostic one unless it occurs in all samples of the drug.

6. On meeting with a difficulty the student should not rest until it is solved.

It is a common mistake amongst students to endeavour to recognise drugs by their general

on the demonstration that exactly one molecular proportion of acetic acid accompanies its production from aconitine.
appearance. Nothing could be more fallacious, as many an examinee has found to his cost. “General appearance” signifies features that may be noticed by a superficial glance, such as size and colour, both of which are apt to vary. Thus, dandelion root and pellitory root, serpentine and Indian pink root, cummin and some varieties of fennel fruit, hemlock fruit and Russian anise, kine and extract of logwood, might easily be mistaken for one another at a cursory glance. Again, coccasilia bark may be meet with in slender pieces not two inches long, or in “bold” quills several inches long; cusparia bark may be hard or spongy externally, in pieces two inches long or in large quills nearly an inch and a half broad and eight to ten inches long.

The apprentice will do well to examine all the roots, barks, leaves, etc., in the pharmacy systematically and in groups, taking, for instance, all the roots seriatim, and so on. A note-book, with clearly but concisely written notes, allowing plenty of space between words and lines, so as to ensure easy reference, will, in the case of some persons, serve to impress what is learnt on the memory, and in the case of others will prove useful for subsequent reference. Leaves and flowers are best studied between April and September, when fresh material can be obtained. If dried material only is obtainable, softening in water over a spirit lamp, or soaking in hot water, will enable the student to observe the outline and characteristic features of the specimens.

A few illustrations of the examination of drugs will next be given.

(The British Pharmacopoeia.)

At the meeting of the General Medical Council, on May 28, Sir Richard Quain referred in his presidential address to the revision of the British Pharmacopoeia which is about to be undertaken, and gave some historical details as to the origin of the national medicine book in the following words, for a corrected report of which we are indebted to the courtesy of Mr. Miller, the Registrar.

“The subject of a revised edition of the British Pharmacopoeia having been recently so much discussed, it seemed to me that I would not be occupying the attention of the Council unprofitably if I devoted a small portion of this address to a résumé of what has been done hitherto in relation to the Pharmacopoeia. No doubt it would be a matter of interest to go back to the origin of such works as the Pharmacopoeia generally, but I will not presume to occupy more of your time than to say that the first notion of such a work originated, according to the statement of my learned friend Dr. Munk, in the 'Dispensatory' of Dr. Valorius Cordus, issued in 1542 on the authority of the University of Nuremburg. It was described as a collection of medical recipes gathered from the works of the most esteemed writers, which he had met with in his travels. The 'Pharmacopoeia Augustana,' issued in 1601, is the reputed parent of the various pharmacopoeias that have succeeded it.

“The first London pharmacopoeia was issued in 1618, just a century after the foundation of the Royal College of Physicians. A second pharmacopoeia was published in 1650, a third in 1677, and a fourth in 1721, during the presidency of Sir Hans Sloane. The authors of this work took credit to themselves for rejecting medicines of little use, for altering formulas that were absurd and inconsistent, for excluding such as savoured of superstition and, generally, for the endeavour to make the work consonant to reason and experience. . . . . . . . The compilers of the Pharmacopoeia hoped to compress within moderate bulk such a variety of medicines as would satisfy as well the lover of the old as the lover of the modern prescriptions, those who preferred simplicity equally as those who still adhered to complexity in official formulae. Such sentiments and such feelings are very much those which would seem to guide the compilers of the later editions of the Pharmacopoeia.

"The next edition was long in preparation, and with a few exceptions it may be regarded as a new work. It was published in 1746, and may in every respect be looked upon as a great improvement on the edition of 1721, and the third edition that had preceded it.

"Successive editions, at intervals which averaged about twenty-five years, the shortest being twelve and the longest forty-four years, were prepared with more or less improvement as regards their construction. Of these the ninth, published in 1836, was the most important. It was produced under the management of the elder Dr. Babington, of Sir George Tuthill, of Dr. Paris, and of Dr. Hue, aided by Mr. Richard Phillips, F.R.S., who had devoted much attention to pharmaceutical chemistry. This pharmacopoeia was undoubtedly a great improvement upon the previous edition, and is marked by the admission for the first time of the alkaloids, such as aconitine, morphia, quina, strychnia, and veratria, of hydrosaxon and phosphoric acids, of iodine, bromine, and preparations of cresocele, ergot, and lobelia. "If," says the College, ‘some of these would appear as yet but little approved by experience, we have, nevertheless, included them, that whosoever should think fit to administer them may have them at hand, accurately prepared and fitted for his use.’

"The tenth and last edition, published in 1851 differed little from the previous edition, chloroform, cod-liver oil, tannin and gallic acids, and atropine were included, and aconite was omitted, so, too, was the bromide of potassium.

"Pharmacopoeias very similar to that of London were also published in Edinburgh and Dublin by the respective Royal Colleges of Physicians, but I am sorry to say that I had not time nor material for referring to them specially.

"By the Medical Act (1858), the right of future publication of the pharmacopoeias of England, Scotland, and Ireland was, with the consent, asked for and obtained, of the several Royal Colleges, transferred to our Council by Clause LIV. of the above-mentioned Act, which reads as follows:--

"The General Council shall cause to be published under their Direction a Book containing a List of Medicines and Compounds, and the Manner of

* The average interval of the publication of the British Pharmacopoeia would seem to be about ten years.
preparing them, together with the true Weights and Measures by which they are to be prepared and mixed, and containing such other Matter and Things relating thereto as the General Council shall think fit, to be called "The British Pharmacopoeia"; and the General Council shall cause to be altered, amended, and republished such Pharmacopoeia as often as they shall deem it necessary.

"On the first day of the Council's first session, November 23, 1858, a Committee was appointed to report at the next meeting as to the recommendation of a Committee for preparing the National Pharmacopoeia, and the powers to be conferred on that Committee.

"In accordance with their report a Pharmacopoeia Committee was appointed, with powers to request the co-operation of the three Royal Colleges of Physicians, and the Pharmaceutical Society (Minutes, vol. i., p. 6).

"This Committee appointed sub-committees for England, Scotland, and Ireland, the members of which, as experts in certain departments, were to undertake the preparation of the work. The sub-committee in London consisted of the following members of the Council:—Sir James Clark and Mr. Nussey, and as experts Dr. Farr, Dr. Garrod, Mr. Peter Squire, and Mr. Warington; in Edinburgh of Dr. Christian, Dr. Maclogan and Dr. Wilson; in Dublin of Sir Dominie Corrigan, Dr. Aquilla Smith, Dr. Apjohn, Mr. Leet and Dr. Nelligan.

"It appears that this issue of the Pharmacopoeia after much pains and trouble had been expended on its preparation, was ready for publication in November, 1859; that is, five years after its inception. It was resolved that it should be issued in two sizes demy 8vo and 12mo (Minutes, vol. ii., pp. 315–318, December 12 and 19, 1862, and of the former size 13,000 copies were printed, and of the latter 15,000.

"The cost of the preparation of this edition seems to have been £6292, of which £4480 were paid for 'authorship and editing.'

"The work when complete was, according to Act of Parliament, submitted to the Treasury, to decide on the price, and by the Treasury it was referred to the Controller of H.M. Stationery Office, who reported that the publication might have been got up in a far less expensive style for less than half the cost of printing and binding. The Executive Committee thanked the Secretary of the Treasury for his communication, and gave an assurance that in future editions his recommendations should receive attention (Minutes, vol. iii., p. 333).

"This work had scarcely issued from the press when faults in it and objections against it were found on all sides. Sir Thomas Watson, whose great experience, prudence, and moderation in language could not be questioned, declared from the chair of the College of Physicians that the work was 'a dangerous one,' and must not be used. The result was that this edition was virtually suppressed, to the great pecuniary loss of the Council. This result cannot be read as favouring the appointment of special experts in the construction of the Pharmacopoeia, inasmuch as the Committee which prepared this issue were largely composed of eminent experts. It seemed to me, who had then recently been nominated by the Crown as a member of the Council, that the Council must prepare a revised issue of the work. On a motion made by me on April 27, 1864, and adopted by the Council, a Committee was appointed to consider and report on the arrangements to be made for producing a new edition of the British Pharmacopoeia (Minutes, vol. iii., p. 2).

"The Committee, as ultimately appointed, consisted of only five members, the President (Dr. Barrow), Dr. Christian, as Chairman, Dr. Sharpey, Dr. Apjohn, and myself as Honorary Secretary, and by these gentlemen the second edition was prepared for the press. Dr. Christian, Dr. Farr, and Dr. Apjohn, who had rendered assistance in the preparation of the first edition, were requested to continue their services as reporters.

"On April 15, 1855, the Committee reported that they had engaged the services of Mr. Warington, F.R.S., of the Society of Apothecaries, and Dr. Redwood, of the Pharmaceutical Society, to aid in the preparation of this edition.

"When this work was completed by the Committee above named and their pharmaceutical assistants, the Council was so well satisfied with the result that they voted an honorarium of £500 to the Committee. It should be mentioned that Mr. Warington's health failed, and that Dr. Redwood had then sole charge of the conclusion of the work under the control of the Committee.

"The book was ready for the press on March 15, 1867, and 20,000 copies were ordered to be printed. In all, 40,000 copies of this edition, which met with universal approval, were sold.

"In 1866 a memorial was presented to the Council from the meeting of the British Association at Birmingham, requesting that the sum of £250 might be placed in the hands of a Committee to be used for the promotion of therapeutical investigations. Upon this it was resolved:—

'That the proposed investigation of the subjects referred to does not come within the province of the General Medical Council, nor, were it in its power, has it any legal authority to expend funds on such enquiry' (Minutes, vol. iv., p. 7).

"A third edition of the work was called for, and prepared in 1885 by a Committee consisting of myself as Chairman, Dr. Aquilla Smith, Sir Henry Pitman, Professor Macnamara, Mr. Collins, Mr. Bradford, and Dr. Haldane. The lamented death of Mr. Warington since the issue of the previous edition led to the appointment of Professors Redwood, Attfield, and Bentley as editors of the work under the supervision of the Committee. Of this edition 40,562 copies have been sold up to the present time. The amount of profit on the sale of this last edition and the addendum for the last ten years is roughly £1400.

"It must be mentioned that in 1874 an Appendix was prepared, by Dr. Attfield as editor, Professor Redwood's health having then failed, which was inserted in the reprints of the edition of 1867. In 1890 an Addendum to the Pharmacopoeia of 1885 was prepared.
by Dr. Attfield as editor, with the valuable co-operation and assistance of a Committee of the Pharmaceutical Society, and of this work 18,529 copies have, so far, been circulated.

"After an interval of ten years since the last edition of the Pharmacopoeia was published, it is proposed to issue a new edition. In this interval very considerable movement has taken place in all the matters which relate to the composition and construction of the Pharmacopoeia. It may well be questioned whether that movement is, in all instances, one of progress, but, whether it is so or not, it is the duty of the Council to take care that, in all that relates to it, the work is as accurate and complete as the most diligent research, care, and experience can make it. With a view of obtaining the fullest information on the subject, communications have been addressed to the whole of the licensing authorities, inviting suggestions as to additions, omissions, and emendations, and sixteen of these bodies have responded. The reports with which they have favoured the Council show the great interest and care which they have devoted to the subject. All these reports have been printed for the use of the Pharmacopoeia Committee. A request for co-operation in the work was also addressed to the Pharmaceutical Society, which has responded by sending a report on the articles, which in the opinion of its Council should be added to or omitted from the Pharmacopoeia. The Council are greatly indebted to the several medical licensing authorities for the assistance which they have thus rendered.

"Communications have also been received from India and the Colonies through official sources. These communications have also been printed for the use of the Committee.

"The interest which the preparation of the Pharmacopoeia has excited might be judged by the numerous papers which have appeared in the various journals, and by communications from other sources. It will be the duty of the Pharmacopoeia Committee, increased in number if thought fit by the Council, to thoroughly investigate these various communications, of which analyses and summaries have been prepared for their convenience by the Editor. For this purpose it will be necessary for the Committee to hold a special meeting during the summer or autumn as may be most convenient to the members, the fees for which should be as for a meeting of the Executive Committee, according to a former precedent.

"Perhaps I may here point out briefly the conditions under which the Pharmacopoeia Committee will have to act. They will have to regard, first, the legal definition of their duties as set forth in the Medical Act; secondly, they will have to regard their duties to the profession, which will require them to decide as to those preparations which should be omitted and those which should be introduced—to repeat a quotation of the remarks of the College of Physicians, to which I have already called your attention, by rejecting medicines of little use, altering formulas that are absurd and inconsistent, excluding such as savour of superstition, and generally, endeavouring to make the work consonant to reason and experience; they have,

thirdly, to regard the interests and education of pupils who have to make themselves acquainted with the contents of the work. Above all things it is desirable that the Pharmacopoeia should not be made a book on therapeutics and pharmacology. To do this would be to introduce a great novelty into the practice of physic; that is, the treatment of disease by Act of Parliament. My conviction is that the forthcoming edition of the British Pharmacopoeia will be one worthy of the Council under whose direction it is issued."

ON DROPS.*

BY J. B. HANNAY.

The formation of drops, their variation with the density and chemical composition of the liquids forming them and their variation with temperature and frequency, have been the subject of investigation by several chemists and physicists, but without reaching unanimity as to the definition of a drop, or the cause of its parting from the flowing liquid.

The author referred to the first investigation to define a standard drop and discover the laws regulating its foundation by Guthrie, according to whom a full normal drop could not exist, all drops being more or less imperfect. He found that the quicker the rate of dropping the larger the drop, and this he explained by supposing that when a drop parts from a solid support a portion of the root or stem of the drop is torn back by the attraction of the solid from which the drop falls.

This conclusion the author tested in 1878, by making a liquid drop from itself: (1), by ascertaining if there is variation in the size of drops into which a smooth running stream divides as it falls when the rate is varied; (2), by allowing's liquid to drop from a column of its own substance retained in position by walls to which it does not adhere, for instance, mercury dropped from a clean dry glass tube. Both experiments showed the same variation of size with rate as when dropped from a solid. The theory of a portion being torn back by adhesion was therefore disproved, and the conclusion arrived at was that the neck of a drop forms a tube through which liquid is flowing into the drop, and after a drop begins to fall it receives an accession of liquid during the time taken to complete the rupture of the neck, this accession varying directly as the flow. Thus a conclusion diametrically opposite to Guthrie's is reached, viz., that a true drop is one of which the rate is infinitely slow, and all other drops are greater than a true drop, and not less, as Guthrie concluded. The weight of a true or normal drop is found by determining the difference of weight with rate, and reducing the rate to zero, which then gives the weight of a drop at the moment it begins to part. Experiments with solutions of potassium iodide, potassium nitrate, potassium sulphate, and magnesium sulphate, showed that the size of drops has no connection with the viscosity or internal friction of the solution. Thus, while potassium iodide increases the rate of flow or

* Abstract of a paper read before the Royal Society of Edinburgh on May 6, 1886.
diminishes internal friction, and magnesium sulphate has an opposite effect, yet potassium iodide solution of twice normal strength and magnesium sulphate solution of normal strength form almost identical drops. The conditions under which a drop partly, its root or stem were studied by causing water to drop through oil of different densities and viscosities, and drops of oil were also allowed to rise upwards through water. In this way the influence of viscosity was eliminated.

The size of the normal drop of distilled water in olive oil was 0.4096 C.c. When dropped at the rate of ten seconds to a drop the volume is increased to 0.5611 C.c., while drops formed from a cylinder of water arranged so as to eliminate the effects of gravity is 0.6470 C.c., which shows that the determining factor in the formation and parting of a drop is controllability. Gravity acts by pulling the drop out of its spherical form, the contractile force of the liquid will not permit of this form, but at once starts a constriction which shears through the neck and detaches a drop. The author confirms Tate's observation made in 1864 that "The weight of the drop is sensibly proportional to the diameter of the tube from which it falls, hence the force which holds the drop is a surface one, and not one of general cohesion. It is only an extremely thin envelope of the drop which influences its size and shape." This fact was proved by dropping water at 20° C. into benzine vapour at 87° C., so that the benzine vapour quickly condensed and formed a thin envelope on the water drop. The weight of the normal drop of water being 0.1081 C.c. when dropped in benzine vapour it was reduced to 0.0449 C.c. Traube has shown that in the case of certain organic alcohols and acids the volume of the drop is proportional to their rise in height in the capillary tube. It was found that in the case of the saline solutions already referred to the size of the drop is in close agreement with the capillary constant. The author concludes that the weight of a normal or infinitely slow drop is controlled by its surface tension or contractility, while when dropping in practice it is modified by the rate of flow, by its gravity, the viscosity of the medium in which it drops, and by its rate of fall, all of which affects the lifetime of the closing neck.

A PHARMACY IN CHINA.*

The premises occupied by the Chinese pharmacist usually consist of a shop on the ground floor, a store-room at the back, and a gallery which is reached by a winding staircase leading upwards to the roof, which is flat and forms a terrace; the back room also serves as a laboratory. Both the gallery and the shop, which are connected, are filled with all possible articles relating to pharmacy and surgery. By the side of the gallery are built two smaller rooms, which seem to be equally used as store-rooms and at the same time as sleeping rooms for the assistants. On the terrace itself various herbs and roots are laid out to dry in the sun.

The proprietor of the business does not live on the premises, but spends his leisure time at his house outside the town, while the assistants are left in charge of the shop. The streets in China are very narrow, so that the shop is almost always cool throughout the day. The doorway is remarkably high. On the right and left of this a counter extends along the whole length of the shop, terminating at right angles, so that it is impossible for the public to see what the assistants are doing. A row of seats is placed in the body of the shop for the convenience of customers, and the walls are decorated with advertisements and mottoes relating to pharmacy. Of these maxims only a few deserve special record, for instance, a favourite motto is "Two eyes are needful to the druggist when buying drugs, the doctor only needs one eye, and the patient should be blind." Special attention is paid to the furthest end of the shop immediately opposite the entrance. Here the pharmacist places neat rows of porcelain jars, while in between carefully labelled drawers are fitted, and on the top of the whole is a glass-sided urn of tin or some other bright metal, usually surmounted with a board bearing the owner's name. In a corner of the shop stands an altar dedicated to the memory of the owner's ancestors. On it perfumed candles are burnt and a number of the favourite dishes of the departed are spread out. At certain times of the year bits of coloured paper are burnt on the altar, which are supposed to represent different utensils and articles of apparel needful to the deceased in his after-life. This tender thoughtfulness for the comfort of the departed comprises nearly the whole of the Chinaman's idea of religion.

The proprietor is generally seated at the entrance of the shop, from whence he directs the management of his business. All prescriptions are brought to him. He examines them and hands them to his assistants to be made up subsequently. At the entrance, too, all consultations take place, and prices are agreed upon. A Chinese laboratory is not by any means overstocked with apparatus. The whole plant consists merely of a few big marble or granite mortars, a set of sieves, and a couple of fire-bricks; in fact, the Chinese make no distinction between the sciences of chemistry, physics, and natural history. A certain number of chemical preparations are certainly concocted by the native pharmacists, but their manufacture is not based on the slightest scientific principle. Thus, methods of employing specific weights are entirely unknown to the average Chinese operator. A few exceptions may be found among those who have come frequently in contact with Europeans, and may have thus learned to place some value on apparatus and appliances which they have previously despised.

The following recipe for the manufacture of a sublimate was given by Dr. Ivan, a member of the Franco-Chinese mission to the authorities in Paris:—Sulphate of iron, 940 grammes; sulphate of alumina, 920 grammes; potash, 900 grammes; sulphate of mercury, 150 grammes; an unknown sulphate, 600 grammes; ordinary table salt, 600 grammes; borax, 930 grammes. These ingredients are mixed in a certain order, and are then exposed to fire heat. Of course, from a European standpoint, such a concoction would be condemned as useless. In fact, most of the

---

* Translated from the Apotheker Zeitung.
Chinese prescriptions are only put on paper with a view to calculating the cost of the ingredients. No notice whatever is taken of the proportion or effect of the drugs. Naturally, this method saves our Chinese friend from many of the difficulties with which the European pharmacist has to cope, and his whole method of doing business is on a par with this process. The Chinese classify natural products in the most irregular manner without the least regard for appropriateness. Of course, in a country where the science of pharmacy in all its branches is so imperfectly understood, it cannot be expected that much good can result from its practice, still we must give our Chinese colleagues credit for being very shrewd observers, and for possessing a thorough knowledge of the qualities of all the products which are dealt with in their drug markets. The "Pen-tao," or Chinese Pharmacopoeia, is almost daily consulted by the Chinese druggist, and is very highly esteemed.

Great care is exercised by the native druggists in collecting and preparing plants and other natural objects. Buds, flowers, roots, and leaves of the same plant are supposed to produce totally different results. The various parts of the plant have, according to the Chinese method, to be collected during certain periods, and at a certain stage of development, so that collecting goes on all the year round. The middle and southern provinces of China are very bare of woods, a circumstance which is probably due to the dense population, which causes all the suitable ground to be used for agriculture. From reports of travellers we gather, however, that the south-western provinces of China are, on the contrary, densely wooded. The mountainous islands of Formosa and Hainan are doubtless well wooded, the former possessing a great number of camphor trees, which furnishes next to Japan, one of the richest sources for the supply of camphor to our markets.

The careful manner in which the Chinese preserve their plants or herbs is evident from the fact that the dried flowers and leaves retain their natural colours in a remarkable degree. The reason of this exactitude may be due to the Chinese belief that the precise effect of various substances is mainly influenced by the manner of their application. For instance, a doctor would usually order medicine to be given either in powder or in pills, or dissolved, because he feels convinced that the effect produced would vary according to the state in which the medicine is exhibited.

In China a chemist will commence his career as an apprentice, and after having served for three years in shop and laboratory will begin his theoretical studies. This training seems to answer in a country where the pharmacist carries on his business more on a trading than on a scientific basis. The Chinese pharmacists form a very influential caste, and much respect and deference is shown to them by the people. For instance, the quarter at Canton where they chiefly reside has been named after them "Physic Street." This name would appear, however, to be only partially appropriate, as only wholesale dealers live there, and they have nothing to do with the dispensing of drugs to the public. The dress of the pharmacist is that of the well-to-do classes, consisting of a long cloak reaching down to the ankles, and a large cone-shaped straw hat, covered in summer with horsehair and with black velvet in winter.

The pharmacists, knowing that their profession is usually associated with the thoughtful and grave physiognomy of the learned, imitate those characteristics, and are found affecting a stoic calmness and adopting a patronising demeanour when talking to the public. Comical are the gestures with which they seek to impress the uneducated with a sense of their mental superiority. The Pen-tao, or Chinese Pharmacopoeia, is divided into fifty-two volumes, which are again sub-divided into numerous parts and chapters; the work seems to treat with the whole creation, and thus affords the student a wide scope for work. The 1st and 2nd volumes describe the origin and growth of pharmacy, the 3rd volume deals with the effects of certain remedies. The 12th to 26th volumes contain a history of the vegetable world, these volumes being classified under eleven heads, which does not speak favourably for the work. The 38th volume is of special interest; in this nothing is discussed but antique furniture, apparatus, and clothes worn by druggists in both past and present times. In the 62nd volume anatomy is dealt with, especially that of those parts which are most likely to require medical treatment.

In Pekin, where hawkers and itinerant peddlers are numerous, we find in the streets the medicine cheap-jack and the quack doctor. These people are always surrounded by a crowd, and it is very comical to notice how a quack doctor puts some ointment on his finger and then daubs it under the noses of his audience who are squatting round him, and who without moving a muscle allow the wonderful medicine to have its effect upon them. The effect of rat poison is represented in a very realistic way by its vendors; they spread out on a piece of blue cloth on the floor their bottles, etc., and in front of these they place a number of dead rats.

ANALYTICAL NOTES.

NEW REACTIONS FOR MORPHINE.—The fact that certain pteridines produce with nitric acid and other tests colour reactions which closely resemble those of morphine, while the various phenols also nearly resemble the ferric chloride reaction, has induced M. Bruylants to experiment further in this direction. Thus he modifies Fröhde's test, and combines with it the test of Huseman in the following manner:—A portion of the alkaloidal residue is dissolved in sulphuric acid in a watch glass; a little of this solution is placed on the surface of a white tile and a trace of Fröhde's reagent containing 1 centigramme of molybdate in each cubic centimetre of acid is added, when the well-known lilac tint is produced. Then the watch glass and its contents are warmed on the water bath, another portion is taken up and treated while warm with the same reagent. In the warm solution, a fine green colour is obtained. This established, a minute particle of nitre is dropped into the green solution, when the tint immediately changes from green to red, slowly
fading and becoming yellowish. The author enumerates experiments with the other opium alkaloids, which give marked colours when tested by the same successive tests, but which, however, are quite distinct from those obtained in this manner from morphine. Further, on adding a trace of solution of iodic acid to a warm solution of morphine in sulphuric acid, a lilac tint, passing slowly to red, is obtained; with more of the reagent a red colour is immediately produced (Journal de Pharm., May 1, 1895).

**Flourine in Beer.**—Stefelmann and Mann detail a method for the detection of minute quantities of flourine in beer as a preservative, of which König's antiseptic salt, consisting of 85 per cent. hydrofluosilicic acid, and 15 per cent. acid ammonium fluoride has been vaunted. From the beer, freed from carbonic acid, the flourine is precipitated by calcium and barium chlorides, and used for the production of hydrofluoric acid, which is allowed to etch a watch glass; if the etching is only very faint the glass must be breathed upon (Ph. Centraihalle, xxxvi, 249).

**Testing Balsam of Peru.**—Regarding the nitric acid test and other methods for testing Peruvian balsam unsatisfactory, Messrs. Gehe and Co. have found the determination of the percentage of cinnamcin and the sapoification number a valuable method in testing this article. A series of experiments on some fifty samples show that in genuine balsam the proportion of cinnamcin lies between 57 to 60 per cent., the sapoification equivalent being from 235 to 238. If a balsam shows results differing from these figures it can be pronounced as adulterated with certainty; if the sapoification number is right and the proportion of cinnamcin too low, the sample is at least of inferior quality. The test is applied thus:—About 5 grammes of the balsam is shaken, 5 grammes of water and an equal quantity of official solution of soda. The cinnamcin is then extracted by washing with three successive 10 grammes of ether. The ether is evaporated on a water bath, and the cinnamcin weighed. The ether takes some time to volatilise, it is therefore necessary to make successive weighing, the final one being taken when the loss is not more than 1 centigramme in five minutes. The weighed residue 35 to 40 C. of semi-normal alcoholic potash solution is added, and about 20 C. of alcohol; this mixture is saponified on the water bath, and the amount of uncombined alkali determined by means of semi-normal acid solution (Pharmaceutische Centraihalle, April 25, 1895).

**Reduction of Fehling's Solution by Sulphonial.**—Lefon calls attention to the error which may occur when examining the urine of patients undergoing treatment with sulphonial, since the excretion under these conditions gives, with Fehling's solution, a reduction precisely similar to that due to sugar, although optical examination by the polarimeter may show it to be absolutely free from dextrorotatory power, and therefore free from glucose (Comp. rend., vol. 120, p. 933).

**Assay of Narcotic Extracts.**—L. von Ittale publishes the following modification of his method of assaying narcotic extracts:—Three grammes of extract are dissolved in 20 C. of water with the aid of 3 drops of dilute sulphuric acid (1:3); to this 10 C. of acetate of lead solution (1:10) is added, and after allowing the precipitate to settle, 16 C. is filtered off. To this 40 C. of a mixture of 75 grammes of ether and 25 grammes of chloroform are added, together with 4 C. of solution of ammonia. The whole is well shaken for one minute, the ether-chloroform layer made up to its original volume, and again shaken for one minute. Twenty-five C. of the ether-chloroform layer is then separated, evaporated, and the alkaloid determined volumetrically. In a mixture containing 0.855 per cent. of alkaloid this method indicated 0.818 per cent., whilst Dietrich's process showed 0.8185 per cent. (Apotheker Zeitung, and Pharm. Post, xxviii, 236).

**Cultivating Sponges.**

Sponge farming has been found to be a very profitable industry, and at present there are hundreds of acres in the Gulf of Mexico, along the Florida coast, devoted to this novel purpose. The attempt to grow sponges was first made when it was discovered that the sponge fisheries of the Bahamas and the Gulf coast of Florida showed signs of becoming exhausted. It has since been found that under proper cultivation sponges may be raised which are superior in quality and command higher prices than those found at sea. The site for a sponge farm is usually some arm of the sea where the salt water flows in freely. The only preparation necessary is to drop in rocks, stones, and other substances for the sponges to fasten themselves to and to dam up the lagoon so that the sponge seeds cannot be blown out to sea. The farms at first obtained their supplies of sponge seeds from the Fish Commissioners, but latterly they obtain them directly from the sponge fisheries. In the autumn of the year the various varieties of sponges are purchased by the sponge farmer, care being taken to secure both the male and female cells. The sponge seeds are generally kept in small "pounds" during the winter months, and here the masses of protoplasm develop and grow. The spores are liberated early in the spring. They swim about, and the eggs grow rapidly and soon attach themselves to the rocks or coral at the bottom of the water. The sponge farm requires little attention after it is once started. The sponges grow slowly, and, as a rule, none are pulled up till the end of the third year. The largest sponges are then gathered, and the smaller ones are left to produce new seeds and grow to a larger size. The sponges may be readily gathered on sponge farms, since the water is usually shallow and smooth, and the dangers of ordinary deepsea sponge fishing are not encountered. The finest sponges raised in this way are said to sell for from $1.50 to $3 per pound. If no diseases or enemies get into the sponge beds, the sponges yield large crops year after year. The yearly income from the sponge farm is said to range from $1000 to $10,000, according to its size, location, and age.—Scientific American.
At the first meeting of the newly-elected Council the chair was taken by Mr. Carteign, and after the confirmation of the minutes of the preceding meeting the Chairman formally introduced the two new members, Mr. Cross, of Norwich, well known as having been for many years an active member of the Board of Examiners, and Mr. Savory, less well known personally, but the representative of a name very familiar to the older members of the Society.

On a ballot being taken for the election of President, the choice of the Council fell upon Mr. Michael Carteign, who, in taking the chair, expressed his sense of the honour they conferred upon him, adding also that in again accepting the position of President he was influenced solely by the belief that he should be furthering the interests of the Society.

In the ballot for Vice-president Mr. John Harrison was elected by a very large majority of votes, a result which he spoke of as a gratifying surprise to himself, but sufficiently pernicious to make him hope that in discharging the duties of the office he would have an extension of the kindness which had led his colleagues to place him in that honourable position.

In the ballot for Treasurer Mr. Robert Hampson was re-elected to that office, and in acknowledging the compliment, spoke of the interest he took in the affairs of the Society and his desire to continue it.

On the motion of Mr. Hills, seconded by Mr. Cross, it was resolved that the thanks of the Council be tendered to Mr. W. Gowen Cross for his valuable services as Vice-president during the past three years. Though residents in London might not generally appreciate the personal exertion and occupation of time involved in the attendance at Council and Committee meetings by a resident in the country, Mr. Hills felt especial pleasure in proposing this resolution on that account and because of the loyalty and courtesy evinced by Mr. Cross both to the Society and to his colleagues.

After the formal re-enactment of the standing orders of the Council the officers were appointed for the ensuing year, Mr. Richard Bremridge being re-appointed Secretary and Registrar, Mr. J. R. Hill, Assistant-Secretary, and Mr. E. M. Holmes, Curator of the Society's Museum. Messrs. Frankland, Ransom, and Seward were appointed examiners for the Council press, and Messrs. Holmes, Tanner, and Pinches as examiners for the Jacob Bell Memorial and Manchester Scholarships.

The additions to the Society comprised two pharmaceutical chemists, and two chemists and druggists as members, thirteen associates, and fifteen students.

In referring to the retirement of Mr. Thomas Greenish from the Council, Mr. Hamson moved that an expression of regret, accompanied by acknowledgment of his long services in the capacity of Member of Council and as Treasurer should be addressed to Mr. Greenish. This was seconded by the President and carried unanimously.

The President also read a letter from Mr. H. N. B. Richardson, thanking the Council on his father's behalf for the resolution passed at the last meeting of Council.

A letter from Sir Richard Quain, as President of the General Medical Council, was read by the President, in which the Council was thanked for the list of suggested additions and omissions from the new Pharmacopoeia (see ante, p. 1063), and also for the statistics forwarded by the President at Sir Richard Quain's request.

In mentioning the recent death of Dr. H. F. C. Cleghorn, of St. Andrews, who had been an honorary member of the Society since 1856, and had taken much interest in the Society's work in Scotland, the President suggested that a letter of condolence should be sent to his relatives.

The various working Committees were then appointed as usual, and the Council proceeded to the ordinary routine business.

The report of the Finance Committee was of the usual nature for this time of the year. On the donation account of the Benevolent Fund there is a sum of about £400 awaiting suitable investment.

On the recommendation of the Benevolent Fund Committee, one grant of fifteen pounds, two grants of ten pounds each, and two of five pounds each were ordered to be paid, but the Chairman of the
Committee, Mr. Cross, said the report did not call for special comment.

The report of the Library, etc., Committee gave the usual account of attendances at the Library and Museum, of donations, and of purchases of books recommended. In moving its adoption, the President mentioned the presentation of a crayon portrait of the late Daniel Hanbury, which is of especial interest as being the best likeness of him extant. This portrait will be placed in that portion of the Society's Museum which is devoted to the Hanbury collection.

It was resolved that the Committee should make the necessary arrangements for the inaugural address to be delivered at the commencement of the Autumn Session, and report thereon to the Council.

A communication from Mr. Laidlaw Ewing, the Chairman of the North British Branch Executive, relating to the further work to be done in the Society's premises in Edinburgh, was referred to the Committee for consideration.

Letters were also read from Mr. Bell, the Honorary Secretary of the Hull Chemists' Association, and from Mr. Eseelink, the Honorary Secretary of the Nottingham and Notts Chemists' Association, thanking the Council for the gift of the Journal and Calendar.

The subject of the Research Laboratory was considered in committee, and it was resolved that a special Committee should inquire into this matter and report to the Council in July.

The report of the General Purposes Committee gave an account of the progress made with cases in the solicitors' hands, and instructions were given to take proceedings in certain instances reported upon.

GENERAL MEDICAL COUNCIL.

At the meeting of the General Medical Council on Thursday last, the first business upon the programme for the day was the presentation of a report from the Pharmacopoeia Committee. In anticipation of the publication of the report in extenso, it may be stated that the Committee suggests as desirable that, in connection with the work of Pharmacopoeia revision, the services of scientific referees in Chemistry and Botany should be obtained. For that purpose it was proposed to invite the assistance of Mr. Threlton Dyer and Mr. Holmes as referees in Botany, and Dr. Thorpe or Dr. Russell as referee in Chemistry. The assistance of recognised authorities in Pharmacology and Therapeutics is also considered by the Committee to be desirable, in order that points of difficulty in connection with the properties of particular drugs and preparations may be referred to them. It is suggested that Dr. Lauder Brunton, Professor Fraser, and Professor Walter Smith should be requested to act as referees on these subjects.

Mention was made of the fact that the Pharmaceutical Society of Great Britain has, by request of the Medical Council, appointed a committee of pharmacists to assist in the work of revision, so that a list of questions bearing on pharmacy has been drawn up by the Pharmacopoeia Committee for reference to the Council of the Society.

In addition to the communications already received from medical authorities in reply to applications for information bearing upon the work of revision, it was stated that a memorandum furnishing important information as to the frequency with which official drugs and medicinal preparations as used, has been received from the Therapeutic Committee of the British Medical Association, that a pamphlet giving similar information has been forwarded by Mr. Martindale, and that an instructive report, with statistics, has been supplied by the Pharmaceutical Society. Information of value on various subjects has also been received from other sources, and the Pharmacopoeia Committee expresses, on behalf of the General Medical Council, its thanks for these communications.

The information received from medical and pharmaceutical authorities in the Colonies and India has been summarised by Professor Attfield as well as the suggestions of the various medical authorities, so that the Committee has now before it a mass of information from many sources, arranged in a convenient form for reference. It is in order to deal with the materials before the Committee, it is proposed to hold a meeting in London towards the end of July for considering the preparation of the first draft of the new Pharmacopoeia.

At the invitation of the Committee, Dr. Thomas has consented to act as Secretary and to render assistance to the President in matters relating to the preparation of the new edition of the Pharmacopoeia.

The ninth annual report on the progress of pharmacy has been submitted by Professor Attfield, and the Committee has directed it to be printed, together with an index to the whole series of these reports.

On the motion of Dr. Leech, seconded by Mr. Brudnell Carter, the report was adopted.

In reply to a question as to the payment to be made to Professor Attfield and to the referees named in the report, the President said that beyond the arrangement already made the uncertainty as to the extent of the work required made the exact settlement of remuneration impossible at present, and that matter must be left to the discretion of the Committee.
REVISION OF THE B.P.

In commenting upon Sir Richard Quain's address to the General Medical Council (see p. 1119), the Lancet remarks that if he shows himself a little conservative in regard to the conditions of editorship and preparation of the Pharmacopoeia, it is impossible to deny that he speaks with a rare experience and a large responsibility. With regard to the pending revision of the work, our contemporary states that, though it is undoubtedly expected that the new Pharmacopoeia will mark a step in advance of the present one, it must yet be conceded that the present volume has creditably sustained its place in the estimation of both medical practitioners and pharmacists. "It is easy to find fault with it—to show that it has left undone that which it ought to have done, and in particular has done that which it ought not to, but, as a whole, it is a creditable starting-point for a new edition. We trust that the editorial arrangements in the entertainment of new drugs will carefully avoid both the errors—raw haste and undue delay. This does not imply any very great change in the aspect of the book, but it may imply a great advance in its utility, and may place it in a much more favourable position as respects the rival volumes which enterprising druggists publish as amateur performances in the nature of pharmacopoeias." Surely this last sentence is an unkind cut at works which a large proportion of the profession represented by the Lancet use in preference to the official guide. Possibly, however, the writer of the article has been stirred to exaggeration by the numerous baseless attacks on a volume which has served its purpose well, and is not yet so out-of-date as many of its self-appointed critics would have us believe.

SCIENCE AT THE MINT.

The twenty-fifth annual report of the Deputy-Master of the Mint contains a memorandum by Mr. Robert Austen, C.B., F.R.S., who announces that an elaborate research on the diffusion of liquid metals in each other has just been completed, after ten years' work, and will shortly be communicated to the Royal Society. By means of the recording pyrometer information has been obtained as to the molecular changes which take place in a mass of metal from the moment it begins to cool until it is solid, and afterwards. The result of a number of experiments is that an important generalisation has been arrived at with regard to the connection between the tensile strength of metals and the temperature at which metallic and other bodies in them become solid. Thus, if the solidifying point of the added element is much lower than that of the mass, the metal as a whole will be greatly weakened, while in the contrary case the metal will be strengthened, often to a remarkable extent. Dr. Rose has continued and almost completed his investigation into the relation between gold and chlorine, and details of the experiments will shortly be submitted to the Chemical Society. He finds that the metal can be converted into chloride and distilled in a current of dry chlorine, at all temperatures between 100° and 1100° C. Gold trichloride begins to decompose in air at about 70° C., its pressure of dissociation being just perceptible at that temperature. But the decomposition of the chloride is slow at all temperatures below 180°.

Transactions of the Pharmaceutical Society of Great Britain.

MEETING OF THE COUNCIL.

Wednesday, June 5, 1895.

Present—

Messrs. Allen, Atkins, Bottle, Carneige, Corder, Cross, Gosling, Grose, Hampson, Harrison, Hills, Martin, Martindale, Newsholme, Savory, Schacht, Southall, Warren, and Young.

Mr. Michael Carteige took the chair.

The minutes of the last monthly meeting and of the special meeting on May 22 were read and confirmed.

NEW MEMBERS OF THE COUNCIL.

Mr. Carteige said, as an old President, he should be glad formally to introduce to the Council the two new members who had been elected to it. Mr. Corder was well known as for a long time an active member of the Board of Examiners, and Mr. Savory, although not personally so well known to the trade, would be a familiar name to the earlier members of the Society. Both his father and grandfather were personally known to him (Mr. Carige), and he was glad to welcome a grandson of one of the founders of the Society and a former president.

ELECTION OF PRESIDENT.

On the ballot being taken in the usual way, Mr. Michael Carteige was re-elected President.

The President said he felt it a very great honour to be, after so many years' service, re-elected by a practically unanimous vote. He recognised the spirit in which the offer was made, and felt that he was bound to accept the honour, believing that he should be furthering the interests of the Society in so doing. For that reason only did he gratefully accept the honour conferred upon him.

ELECTION OF VICE-PRESIDENT.

The ballot having been taken, Mr. John Harrison was elected Vice-President.

The Vice-President said this election was one of the greatest surprises of his life, but was none the less gratifying. It had always been a great pleasure to him to be a member of the Society, but he had hardly ventured to look forward to occupying the vice-chair. It had been occupied by many men of far superior attainments to himself, and he felt that though he succeeded to a precious heritage it was also a perilous one. At the same time he ventured to hope that the same kindness which had led his colleagues to place him in that honoured position would be extended to him in his endeavours to discharge its duties, which he hoped to do to the satisfaction of the Council.
ELECTION OF TREASURER.

On a ballot being taken,

Mr. ROBERT HAMPSON

was re-elected Treasurer for the ensuing year, and that gentleman acknowledged the compliment in a few words to the effect that he hoped to continue the interest he had always taken in the affairs of the Society.

THANKS TO THE VICE-PRESIDENT.

Mr. HILLS asked permission to propose a resolution that the hearty thanks of the Council be tendered to Mr. W. Gowen Cross for his valuable services as Vice-president during the past three years. As a resident in London he had special pleasure in proposing this resolution. Those living in the metropolis at a short distance from Bloomsbury Square did not always, he suspected, realise the amount of time spent by members of the Council residing in the country in order to take part in their deliberations. Mr. Cross, living at a considerable distance from town, must during the past three years have spent very many hours in railway travelling, and all present would the more appreciate this when he reminded them that Mr. Cross in his own borough occupied the highest office attainable by a citizen, namely, the honourable and dignified position of mayor. That office must necessarily engage a good deal of his time, but in spite of other engagements Mr. Cross had almost invariably found time to give the Council the benefit of his assistance. Those who had worked with him knew that, whilst not a great talker, he exercised a large amount of common-sense combined with bonhommie in their deliberations, and his loyalty and courtesy both to the Society and his colleagues were proverbial.

Mr. CORDER, in seconding the proposal, said he could from personal experience cordially testify to the services of Mr. Cross, and endorse all that had just been so well said of him.

Mr. BOTTLE: We all share in Mr. Corder’s opinion.

The PRESIDENT said he should like to take the opportunity of expressing not only his indebtedness to Mr. Cross on behalf of the Council, but his own personal feelings of regard and affection, especially as it bore upon the assistance he had rendered to him as President. There were many things in which the President found it a relief to be able to depend on the cordial cooperation and assistance of the Vice-president, and he could pay no higher compliment to Mr. Cross than to say that whenever he had desired his help in the official work of the Council he had invariably rendered it gladly.

Mr. Cross, in acknowledgment both of the proposal and of its unanimous and cordial reception by the Chairman, said it would ill become him to say that he felt a sense of relief at being released from the trammels of office. He was, however, conscious that an office such as he had held involved certain responsibilities which he was gratified to think he had been able to discharge somewhat to the satisfaction of his colleagues, as testified by this cordial vote of thanks. Should he be thought to have discharged the duties in any way as a worthy follower of the distinguished men who had preceded him in the vice-chair it would be to him a source of gratification throughout his life. He need hardly say that in the occupancy of the vice-chair he had endeavoured to sink all personal feeling in the one aim and design of benefiting the good old Society with which they were all identified, and for which, he believed, they were ready to make any reasonable sacrifice.

STANDING ORDERS.

The standing orders of the Council were re-enacted for the ensuing year.

SECRETARY AND REGISTRAR.

Mr. RICHARD BEMBRIDGE was re-appointed Secretary and Registrar for the ensuing year.

EDITOR AND SUB-EDITOR OF THE JOURNAL.

Dr. E. H. PAUL was re-appointed Editor and Mr. JOHN HUMPHREY Sub-Editor of the Journal for the ensuing year.

CURATOR.

Mr. E. M. HOLMES was re-appointed Curator of the Society’s Museum for the ensuing year.

ASSISTANT-SECRETARY.

Mr. J. R. HILL was re-appointed an Assistant-Secretary of the Society for the ensuing year.

EXAMINERS FOR THE COUNCIL PRIZES.

Messrs. FRANKLAND, RANSOM, and SEWARD were appointed to conduct the examination for the Council Prizes competition in July next.

EXAMINERS FOR THE JACOB BELL SCHOLARSHIPS.

Messrs. HOLMES, TANNER, and PINCHES were appointed to conduct the examinations for the Jacob Bell Memorial and Manchester Scholarships.

ELECTION OF MEMBERS.

Pharmaceutical Chemists.

The following, having passed the Major examination and tendered their subscriptions for the current year, were elected “Members” of the Society:—

Foden, Thomas Henry .................... Forest Hill.
Scott, George L ......................... Manchester.

Chemists and Druggists.

The following, who were in business before August 1, 1888, having tendered their subscriptions for the current year, were elected “Members” of the Society:—

Fletcher, Samuel .......................... Burnley.
Palmer, John Main ....................... Clapham.

ELECTION OF ASSOCIATES IN BUSINESS.

The following having passed the Minor examination, being in business on their own account, and having tendered their subscriptions for the current year, were elected “Associates in Business” of the Society:—

Blankley, Frank Fernloogh ................ Chatteris.
Davies, David ............................ Pontypidd.
Dowthwaite, John .......................... Prudhoe-on-Tyne.
Lister, Robert ............................. Leeds.
Stevenson, Andrew ....................... Rangoon.

ELECTION OF ASSOCIATES.

The following, having passed the Minor examination, and tendered, or paid as “Students,” their sub-
scriptions for the current year, were elected without Mr. Greenish's assistance, not only on the Council, but on the various committees.

The resolution was carried unanimously.

THE RESIGNATION OF MR. RICHARDSON.

The President read a letter which he had received from Mr. H. N. B. Richardson, thanking the Council, on his father's behalf, for the resolution passed at the last meeting)

THE MEDICAL COUNCIL.

The President also read a letter he had received from Sir Richard Quain, President of the Medical Council, acknowledging with thanks the receipt of the list of suggested additions to and omissions from the new Pharmacopoeia, and also for certain statistics which he (the President) had at his request forwarded to him.

DEATH OF AN HONORARY MEMBER.

The President said he regretted to announce the death of Dr. H. F. C. Cleghorn, of St. Andrews, who had been an hon. member since 1856. He knew a little of his work, but was not acquainted with him personally. He was highly appreciated in the north; and he (the President), was informed by Mr. McEwan that he often used to visit the Society's premises in Edinburgh, and kept the Society in mind when the Forestry Exhibition was open. It would be right, he thought, that he should write a letter of regret and condolence to Dr. Cleghorn's relatives.

This suggestion was agreed to.

APPOINTMENT OF COMMITTEES.

The Council went into Committee to consider the arrangement of the different committees, as the result of which the following arrangements were made:

General Purposes: The whole Council to meet on the evening before the meeting of the Council, and at such other times as may be necessary.

Finance: The President (Mr. Carteigh), the Vice-president (Mr. Harrison), and Messrs. Allen, Grose, Hills, Martin, Martindale, Newsholme, Savory, and Schacht.

Benevolent Fund: The President (Mr. Carteigh), Vice-president (Mr. Harrison), and Messrs. Atkins, Bottle, Corder, Cross, Gostling, Hampson, Johnston, Southall, Storrar, Young, and Warren.

Library, Museum, School, and House: The President (Mr. Carteigh), vice-president (Mr. Harrison), and Messrs. Allen, Atkins, Bottle, Hampson, Hills, Martin, Martindale, Newsholme, Savory, Schacht, and Warren.

Law and Parliamentary: The President (Mr. Carteigh), Vice-president (Mr. Harrison), and Messrs. Allen, Atkins, Bottle, Cross, Hampson, Hills, Johnston, Martindale, Savory, Southall, Storrar, Young, and Warren.

Evening Meetings: The Staff of the Society's School, the Editor, and the Curator, were requested to assist the President and Vice-president in making arrangements for the Society's evening meetings in London.
The report of the Finance Committee.

The Secretary read the report of this Committee, which was of the usual character, and recommended sundry accounts for payment.

The President (as Chairman of the Committee) moved the adoption of the report and recommendations. There was nothing calling for special remark, either with regard to the receipts or expenditure. On the Benevolent Fund Account the receipts during the month had been about £240, and he feared that the time of year had now come when there would only be small monthly receipts in the shape of subscriptions. He had not made a comparison with former years, but hoped the condition of things was satisfactory. The Orphan Fund remained practically as it was, and also the Donation Account, which still stood at about £400. The Committee did not recommend that this should be invested at present, as it was hoped that a suitable parcel of ground rents would be found before long. He should have said that a small donation of 30s. had been received from the Chemists' Assistants' Association, being the surplus arising from a social evening.

The resolution was unanimously agreed to.

The report of this Committee included a recommendation of the following grants:—

£10 to a former associate (68) who has had seven previous grants; the last in June, 1894. (London.)

£15 to the widow (46) of an associate who has had three previous grants of like amount, which have been devoted to the maintenance and education of two of her children, being this grant for the same purpose. (London.)

£10 to a registered chemist and druggist (77), unable to do anything on account of age. (Cambridge.)

£5 to an associate (62) from 1889 to 1894. He had a grant of £10 in June, 1894. (Brighton.)

£5 to a registered chemist and druggist (54) at present out of employment, but hopes soon to be able to do something. He had a grant of £10 in May, 1894. (Luton.)

One other application the Committee declined to entertain.

Mr. Cross (as Chairman of the Committee) moved the adoption of the report and recommendations, which he said called for no special comment.

The report and recommendations were unanimously adopted.

The Library, Museum, School, and House Committee.

The report of the Librarian had been received, including the following particulars:—

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>April . . .</td>
<td>Day .</td>
<td>288</td>

<td>Evening</td>
<td>118</td>
<td>10</td>
<td>2</td>
</tr>
</tbody>
</table>

Circulation of Books. Total. 196 Town. 103 Country. 93 Carriage paid. £1 4s. 9d.

Donations to the Library had been announced (Pharm. Journ., May 18, p. 1081), and the Committee had directed that the usual letters of thanks be sent to the respective donors.

The Committee had recommended that the undermentioned works be purchased:—

Chemical Technology, edited by Groves and Thorp vol. 2.

Sadler and Trimbles' Pharmaceutical and Medical Chemistry.

Extra Pharmacopoeia, 8th edition.

The Curator's report had been received, and included the following particulars:—

<table>
<thead>
<tr>

<td>1</td>
</tr>
</tbody>
</table>

Donations to the Museum had been received (Pharm. Journ., May 18, p. 1081), and the Committee had recommended that the usual letters of thanks be sent to the respective donors.

The President, in moving that the report and recommendations be received and adopted, said the principal portion of the report was merely formal, but members would be glad to hear that Mr. Thomas Hanbury had presented the Society with an excellent crayon portrait of the late Daniel Hanbury, which was probably the best presentment of him extant. The Committee thought it would be very appropriately placed in that portion of the Museum where the Hanbury collection was located.

The report and recommendations were unanimously adopted.

The Inaugural Address.

It was resolved that the selection of a gentleman to deliver the Inaugural Address at the commencement of the Autumn Session should be referred to the Library, Museum, School, and House Committee.

The North British Branch.

The President, said Mr. Ewing, who was in town on the occasion of the Annual Meeting, presented to the Secretary an account of what had been done at the Society's premises in Edinburgh, showing a small balance still due, but he also stated that the Committee of the Branch had been considering the desirability of making some change in the lower rooms of the old building, to put the secretary's office and library upstairs, and to have the museum below, and desired that the Council should consider the matter and give the Committee authority to make the alterations desired. Plans and estimates had been prepared, and he would suggest that they should be submitted to the Library, Museum, School, and House Committee for consideration and report.

This was unanimously agreed to.

Correspondence.

The President said a letter had been received from Mr. Bell, honorary secretary of the Hull Chemists' Association, stating that they had passed a resolution heartily thanking the Council of the Pharmaceutical Society for the gift of the Journal for the past year. A similar letter had been received from Mr. Ebertia,
honorary secretary of the Nottingham and Notte Chemists' Association, thanking the Council for the gift of the Calendar and Journal.

THE RESEARCH LABORATORY.

The Council having gone into Committee for a short time, on resuming it was resolved—

"That a Special Committee of the Council be appointed (1) To inquire into and report to the July Council to what extent the objects aimed at in the equipment of the Research Laboratory have been attained. (2) To report any suggestions that may occur to them for the conduct of the Laboratory for the future.

"That the Special Committee consist of the President, Vice-president, and Messrs. Allen, Atkins, Bottle, Gostling, Hamson, Hills, and Martindale."

REPORT OF GENERAL PURPOSE COMMITTEE.

The Council, as usual, went into Committee to consider this report, which included the usual letter from the solicitors as to the conduct of cases placed in their hands.

On resuming, the report and recommendations of the Committee were adopted, and resolutions passed authorising proceedings to be taken against certain persons named therein.

Proceedings of Societies in London.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

(Continued from page 1103.)

Mr. E. Goulding, Reporter on Botany, then gave the following:—

REPORT ON BOTANY.

BY E. GOULDING.

The first recent botanical research to which I wish to invite your attention is the work of Mr. F. F. Blackman, on the paths of gaseous interchange between aerial leaves and the atmosphere." By means of a most elaborate and ingeniously contrived apparatus he has obtained some very important results.

On the question of the passage of carbon dioxide into the leaf in assimilation and out of it in respiration widely different views have from time to time been held. The older botanists regarded the stomata as the paths by which it was effected, whilst in later years it has been held that the stomata play no part in the process, but that the cuticle is the medium by which the gas is conveyed. Direct experimental proof has been very difficult to obtain owing to the smallness of the quantities of gas involved, and for this reason no attempt has been made previously to determine them by direct estimation. Shortly after Graham had published the results of his experiments on the diffusion of gases through permeable media, Barthélemy, on account of the readiness with which carbon dioxide can diffuse through casoutchouc, and the similarity of cuticle to casoutchouc in chemical composition, advanced the theory that the exchange of gases between leaves and the atmosphere was a cuticular phenomenon. This view was apparently confirmed by a series of experiments carried out by Boussingault in the same year (1868). His work seemed to show that in assimilation the carbon dioxide absorbed by the leaf enters through the upper surface devoid of stomata, to which the assimilating cells are adjacent, rather than through the stomata of the lower surface. These experiments were conducted upon the leaf of clover.

By a leaf having an upper surface of 37.2 square centimetres, free from stomata, and completely closed on the under side by tallow, 17.5 C.c. of CO₂ were absorbed in a given time. In another series of experiments Boussingault fastened the under surfaces of two leaves closely together by means of paste, so that only the upper surfaces (free from stomata) were exposed to the air; with these leaves nearly the same results were obtained as in the first series.

He also found that leaves with open stomata absorbed less carbon dioxide than those in which the stomata were blocked up with wax. From these experiments Boussingault drew the obvious conclusion that in the process of assimilation the carbon dioxide normally passes into the leaf through the cuticle of the upper surface.

Blackman has shown, however, that this deduction is entirely fallacious. It has been found that the clover leaf can best assimilate carbon dioxide when largely diluted with air. Boussingault, however, carried out his experiments in an atmosphere containing as much as 30 per cent. of carbon dioxide, and hence the erroneous conclusions at which he arrived. The true reason of his results is now apparent. The leaves with the open stomata assimilated less carbon dioxide simply because so much was present that their assimilatory activity was checked, or, in other words, the leaves were choked. In those leaves in which the stomata were closed by tallow, the carbon dioxide diffused so slowly through the cuticle that the assimilation was able to proceed normally, and thus more of the gas was absorbed than in the former case. Blackman has conclusively proved that this is the case by a series of experiments in currents of air containing varying proportions of carbon dioxide. He has found that a leaf with open stomata in an atmosphere containing a small percentage of carbon dioxide assimilates more than a leaf with its stomata blocked up, this result being just the reverse of those published by Boussingault.

Blackman has conducted his experiments by means of a most elaborate and complicated apparatus, the main features of which I will briefly point out.

The leaf under examination is furnished with shallow capsules, 10 square centimetres in area, consisting of a glass plate with a metal rim, through which tubes for the circulation of the air current pass. These are attached to the leaf on opposite sides of the same area by means of soft wax. Then over these portions of leaf a continuous current is kept up. The currents
are generated by aspirators specially arranged to work steadily with small rates of flow (50 to 100 C. c. per hour). The gases enter the apparatus either through an arrangement for removing carbon dioxide, when working on respiration, or through one for adding CO₂ when working on assimilation. To remove the CO₂ the air is drawn through a tower full of beads, over which a stream of strong potash flows continuously. The CO₂ generator consists of a tall tube containing fragments of marble, through which the air-current passes at a constant rate, while very dilute hydrochloric acid trickles down it at an extremely slow rate, which is made constant by special arrangements. From the CO₂ generator or remover, as the case may be, the current of air passes to the receivers in which the portions of leaf are situated. The estimation of the carbon dioxide at the close of the experiment is accomplished by absorption by baryta water and titration with N hydrochloric acid, phenol-phthalein being used as an indicator. Only a small quantity of baryta water is employed in each experiment (under 15 C. c.) and after absorption it is titrated in the tube in which the absorption has taken place. The burettes are in air-tight connection with the receivers, and special arrangements are employed for filling and emptying them, and also for stirring. The whole of this apparatus is in duplicate, so that strictly comparative experiments can be carried out.

By means of this apparatus Blackman has made very numerous experiments on various leaves, thick and thin, and with stomata on one surface only, or on both surfaces, and has found in all cases that in the process of respiration the gas is exhaled through the stomata. When the upper surface of a leaf is free from stomata, practically no carbon dioxide is exhaled from that surface, while a considerable quantity is given off from the lower surface. When stomata occur on both sides of a leaf the amount of carbon dioxide exhaled from each is found to follow closely the ratio of the number of stomata. Similarly, in the process of assimilation, experiments have proved beyond question that no carbon dioxide is absorbed by a surface free from stomata; and that when the stomata occur on both surfaces the amounts absorbed vary directly as the number of the stomata each bears. That the stomata are the only path of entry of carbon dioxide for assimilation was also proved by the following simple experiment: A part of the lower surface of a leaf, the upper surface of which bore no stomata, was coated with wax so as to mechanically close the stomata, and it was found that in that area no starch could be formed, while the neighbouring portion became rich in starch.

The only other communication I have to make is on the phenomenon of polyembryony, or the development of two or more embryos in a single seed. This has been the subject of several investigations, and it has been shown that it may be due to several causes. Before proceeding to discuss these, I will venture to remind you very briefly of the structure of the ovule and the development of the embryo-sac.

The ovule consists of two integuments enclosing a cellular mass, the nucellus. Within the nucellus the archesporium is developed, and after a while frequently absorbs the whole of it, with the formation of the embryo-sac or macropore. The embryo-sac contains a single large nucleus attached to the walls by threads of protoplasm. This nucleus divides into two, which separate one to each end; one of these gives rise to generative and the other to vegetative structures. Each nucleus divides into two, and each of these again into two, so that at each end four nuclei are produced. One nucleus from each end (the polar nuclei) now moves towards the middle of the embryo-sac, where they fuse together, forming the definitive nucleus (which after the oosphere has been fertilised divides repeatedly to produce the endosperm). The three nuclei which are left at one end are termed the egg-apparatus, the three at the other end are termed the antipodal cells; these latter become clothed with cell-walls, the former do not. In the egg-apparatus the other half of the pair which remains after the departure of the polar nucleus is the oosphere, the other pair being termed the synergidae. The embryo-sac at this stage is the gametophyte generation of the flowering plant.

We are now in a position to discuss the causes of polyembryony. It has been shown that it may be accounted for by the fusion of two ovules, or by the formation of several embryo-sacs in one ovule. Further, Strasburger has found that it may be caused by the ingrowth of some cells of the nucellus into the embryo-sac, which then develops into adventitious embryos; while in other cases he discovered it to be due to the production of two oospheres in the embryo-sac, which on fertilisation, give rise to two embryos. Quite recently, a Russian botanist, Tretjakov, has described yet another cause of polyembryony. In Allium odoratum, in addition to the normal embryo formed from the oosphere by fertilisation, not infrequently the antipodal cells also develop into embryos. Sometimes only one of these develops, but in other cases all three start into growth and give rise to embryos. These antipodal embryos commence their development immediately after the fertilisation of the oosphere, and the cell-divisions, at least in the earlier stages, correspond exactly with those in the embryo formed from that cell.

Tretjakov traces an analogy between these antipodal embryos and certain structures which are borne by the prothallia of certain ferns. In some cases (e.g., Pteris cretica) the sporophyte is developed from the gametophyte without the intervention of an oosphere, but arises vegetatively upon the prothallium by direct budding. This vegetative production of the sporophyte by the gametophyte is termed apogamy. Now in the case of the flowering plant we have seen that the embryo-sac corresponds to the prothallium of the fern, and also that the antipodal cells are vegetative portions of it. Tretjakov, accepting the view that the antipodal cells are homologous to the vegetative cells of the prothallium of ferns, compares these antipodal embryos with those arising by apogamy in fern prothallia.

Correspondence.

[Letters to the Editor should be written as concisely as possible, on one side of the paper only, and preferably with name and address for publication.]

THE REVISION OF THE PHARMACOPOIA.

SIR,—This subject is exercising the minds of many at the present moment, and perhaps from the circumstances of the situation there prevails a state of mind not wholly conducive to its satisfactory settlement. Therefore, Whom does the revision most concern, the doctor or the pharmacist? Is absorbing too much attention, and the person whom ultimately it concerns most of all is in peril of being overlooked, viz., the patient. It will be worth while to try the case from the point of view of the last-named.

To the question What is the Pharmacopoeia? there is a simple answer, viz., a list of officially approved medicines. The best by which this list has been approved is usefulness to treat disease, and accordingly it is obvious that those who have the immediate treatment of disease in their hands, and upon whom the responsibility for results falls, must determine what the list shall be. The revision, therefore, of the Pharmacopoeia must be in consultation with the medical profession of the land and the physician, and it is he who must say this preparation gives good or bad results, must be retained, rejected, or modified. Let it be noted that the standard by which each drug is tried is compatibility or incompatibility with the organism, and let the mistake be avoided of making the test-tube the arbiter upon this point. We shall do well to recall Dr. William Hunter's protest of many years ago that the stomach is "a stomach, gentlemen, a stomach," not a stewpan, a fermenting vat, or churn (see Paris Pharmacologica). The Pharmacopoeia is not the growth of a day, it has been built up slowly as a result of trials innumerable upon the sick body, and chemistry will not in reason ask us to discard this or that remedy which has stood the aforesaid test because the test-tube reports adversely. To Griffith's mixture the stomach says "yes," the mixture is acceptable, and we know that the iron thus given to it may be more scientific to take milk, for we know that the gastric juice is not compatible with it—somehow we thrive upon it. It will not be needful to elaborate this part of the argument and insist that the apparatus in the pharmacist's laboratory does not give us an equivalent for the powers of the living tissues.

To parody this statement and contend that chemistry is of no use on such showing and a knowledge of chemical incompatibilities beside the mark would be to err as extravagantly in one opposite direction. No one a priori is justified in administering chemical incompatibilities in mixture, pill, or other form, and if such preparation be advanced it must be on the grounds of the good effect produced upon the body. A knowledge of chemical incompatibilities is of the utmost value to physicians, and upon such knowledge reliance is placed in the treatment of many poisonings. In the examination of a new drug we should first go to the chemist and learn of him what the laboratory has to say, and to wiltily shut our eyes to the characteristics there manifested would be to act the part of a fool. Again, upon the suggestions of the chemist we ought to criticise anew the old and tried preparations, for modifications of these may give us yet better results. Casteria paribus the palatability of a drug is not unimportant to the patient. The keeping powers of a preparation are yet more important, and there is a vast field which, it must be obvious to every sensible man, belongs to the chemist and pharmacist, and which will yield only to his knowledge of how to cultivate. Surely there is room for the co-operation of both workers in the larger domain of therapeutics.

The revision of the Pharmacopoeia belongs then to both, but here comes the rub, why is our friend found in such predomiance on the shelves of the pharmacists? What has this to do with our subject? What does his name and to us so dull? Why do we give such preference to his 'Companion'? Somehow the partnership falls or is very unequally carried out.

Why should not the Pharmacopoeia, which concerns the doctors so much, be to them as practical a guide as it is to pharmacists? If the facts which to us would be useful are to them so elementary, as some maintain, they need not look at them; by a little skilful management of the eyes these addenda could be made to fall on the blind spot. Dr. Lauder Brunton's paper has set forth a number of desiderata from the medical point of view which call for careful consideration, e.g., precautions as to the keeping of medicaments; incompatibility of simples; the risk of prescribing, as, for instance, the best pill basis for permanganate of potash; tables of solubilities, etc., etc.

My own feeling as to the Pharmacopoeia is that it should be altered as little as possible, and that any and everybody engaged in its revision should be a duly-constituted committee; that the expunging from and admission to this inner circle of tried medicaments should be equally hard; that revisions should not be too frequent, in order that we may avoid that fluctuation which must mark current medicine. The Pharmacopoeia should not affect the medicine of the hour, it should live in a calmer atmosphere. But notwithstanding these sentiments I feel that the British Pharmacopoeia is not to us doctors the guide it should be, and I cannot see why on the lines indicated by Dr. Brunton and above enumerated changes might not with advantage be introduced. It would not be untried or new knowledge which would thus be incorporated but facts of practical and everyday application. It would further be of great value to have some indication as to a dosage pro die as well as pro diei, and to introduce the continental plan of the marking thus (1) by the prescriber any dose on a prescription which should stray outside the limits of pharmacopoeial sanction. To both of these points Dr. Brunton makes reference. Might I add another innovation which would, I think, be useful; it would be to put in brackets after each test for impurities the name of the impurity thus to be detected? This would not add appreciably to the bulk of the letterpress, it would make more readable and more capable of retention this part of the description of the drug, and for reference in case of unusual effects, which an impurity might explain, it would be of practical use. To the doctors' faults or ignorance in this respect the pharmacist must again be little less accountable.

There remains to be considered a very important innovation which has been suggested, it is the introduction of some indication of the mode of action of medicines. Dr. Brunton would like this, but thinks we can hardly expect it. On this subject I feel very strongly that no such introduction should take place, but that it should be uncompromisingly opposed. It would at once introduce the whole of the conflicting talk, the bulk of the book would be increased, and the simple character of the Pharmacopoeia would be lost. This belongs to the science or art of medicine, and it belongs to treatises upon the same.

The Pharmacopoeia presents us with the means of treating diseases in the most approved forms; with the means of preparing and recognising these forms and
of detecting any impurities likely to occur; with the dose limits which include efficacy with safety. It might, we think, enlarge the scope of its utility by giving us information as to how best to keep our medicines, how to avoid the more important pitfalls of chemical impurities in the preparation of medicines. I think this information is needed as to the mode of prescribing or conveying insoluble, unstable, or otherwise intractable remedies; by the introduction of tables of solubilities; by further directions upon dosage, etc., but beyond such simple additions we think the revision ought not to proceed.

HARRINGTON SAINSBURY, M.D., F.R.C.P.

Kjeldahl's Process for the Determination of Nitrogen.

SIR,—Kindly allow me to add a word or two to your report of my paper on this subject read at the last meeting of the Chemical Society, by pointing out that, using the Jodlbauer modification of the process, the phenol or salicylic acid is dissolved in the sulphuric acid used for oxidation, and that after the sulphuric acid (and this is the cold) has been separated from the process, the process is completely as in the Kjeldahl-Gunning process correctly described in your preceding paragraph.

The Kjeldahl-Gunning process (sulphuric acid, mercury, and sulphate of potash) gave in my hands correct results with uric acid, aspiragen, caffeine, indigo-tine, morphine, quinine, strachynine, and aniline, while the Jodlbauer or salicylic acid modification was satisfactory with nitrates, nitrobenzene, nitro-naphthalene, nitrolin, dinitrobenzine, trinitrophenol, and potassium para-bromo-chlor-nitrophenol.

It might have been expected that reduction with zinc alone, without the use of salicylic acid, would suffice in the case of aromatic nitro compounds, but I find that if zinc alone be used with such compounds there is loss of nitrogen, which is obviated by the use of salicylic acid, and the same thing appears to hold good withazo compounds; but your reporter misunderstood me when he included in his reference to these compounds aromatic compounds containing amidogen. These, as will have been seen from the bodies I have already enumerated, yield their nitrogen quite easily by the Kjeldahl-Gunning process, except where the amidogen happens to be a part of the active radical.

I would also say that the Kjeldahl-Gunning process gives correctly the percentage of nitrogen in potassium ferro-cyanide, and that it is in the case of potassium ferri-cyanide that the use of sodium thiosulphate and zinc was found necessary in order to get fairly accurate results.

The total error for “blank” estimation, I should like to add, should not amount to more than the equivalent of 0·3 C.c. to 0·4 C.c. of deion normal soda solution, say 0·0003 gramine to 0·0005 gramine of nitrogen. I should also like to say that, in the distilling apparatus which I use, the block tin tube does not dip directly into the standard acid, as might perhaps be inferred from your report (although such is not actually stated to be the case), but that it is connected with a pear-shaped glass bulb, which serves to conduct the ammonia charged steam into the standard acid, and at the same time, by the expansion of the remaining acid, reduces the trituration, no boiling acid.

In troubling you with these addenda to your report, I only seek to save possible trouble to any reader who from reading it may be led, without previous experience, to try the process, the successful working of which depends mainly upon the observance of what might appear to be my details.

BERNARD DYER, D.S.C., F.I.C.
17, Great Tower Street, E.C.

Elementary Pharmaceutical Education.

Sir,—As I was unable to raise the matter at the Annual Meeting, which I had fully intended to do, perhaps you will kindly allow me a little space in which to supplement my letter on the subject. More than six years ago, since, at an annual meeting, I drew attention to the anomalous state of the Preliminary examination. I had expected that I would meet with a good deal of opposition, but, so far from that, the members present seemed unanimously in my favour, and several past and present members of the College heartily sympathised with me. That was more than six years ago, and since that time there has been a steady flow of memorials and resolutions to the same effect direct to the Council, and yet that body remains entirely passive. Surely so great a want as this for the next generation of chemists? There is little doubt that a majority of the members and associates of the Society, if not of the whole body of physicians, advocate reform, and the power to act has been always in the hands of the Council. I see that the President, in his comments on the annual report, declared that the College would not adopt the scheme, after the candidates had learnt the necessity of spending sufficient time and money in preparation for the examinations. I do not believe that any increased outlay on those directions will lessen the number of failures.

The ground for this belief is the fact that a very large proportion of the rejected college students have never attended any college for several years, in the aggregate, at pharmaceutical schools, but they seem really incapable, owing to want of early training, of grasping the necessary information. To subject these men to proper preliminary training would either develop them sufficiently to enable them to pass, or would keep the College of pharmacy altogether; either consummation was devoutly to be wished. Moreover, in the Society's school the bulk of students, I believe, spend what is usually considered an adequate amount of time and money's preparation for the examinations, yet the percentage of failures from that institution is fully equal to that from anywhere else. I am not advocating increasing primary education in order to benefit a favoured few, but for the material benefit of the ordinary pharmacist. Every sensible man admits, and it has now been laid down more forcibly than from the presidential chair, that the only chance of existence for the individual pharmacist is in the (store and amalgamated cutters, is his personal superiority, and the confidence in his skill and knowledge he can impress upon his circle of customers and how this is to be attained by men with the educational acquirements of a respectable workman. It is difficult to see. Besides this, if the subjects of the qualifying examinations are to be learnt at all, it is surely the duty of the controlling body to see that they are learnt thoroughly, and I am sure this is impossible with the basis of knowledge represented by the Preliminary examination. It seems to me that the greatest responsibility lies on the members of the Council in this matter, and I would again urge them to consider it, for upon reform depends the future welfare of pharmacy. Let us not be misled by that foolish and mischievous cry of utility. The real function of primary education is not utility but development, although I do not think that the phrase is an adequate definition, for from the primary, the matter, can say that the subjects I propose to add are useless. As to the remarks of C. A. T., quoted in your last issue of May 25, life is really too short to waste time in discussing education with a man who regards algebra, geometry, and modern languages as "boring as a wet place." Biological facts adduced by C. A. T. assist his arguments.

A. CAMPBELL SMITH.
Notes and News.

CHEMISTRY AT THE STORES.—Not two miles from Charling Cross a well-known photographer lately entered the chemist's shop attached to a big store and asked for an ounce of mercuric chloride, and was somewhat surprised that no questions were asked and that the assistant made no demur to serving him. But the explanation was not long wanting, for the assistant quietly weighed out an ounce of calomel and began to wrap it up, but the photographer, who was also a dabblor in chemistry, politely remarked, "Have you not made a mistake; I asked for mercuric chloride?" "Oh, no!" was the reply, "this is the chloride, we generally call it calomel." "Ah, well," said the photographer, "if you look it up you will probably find in 'Atfield' that calomel is mercurous chloride, and that the mercuric salt is corrosive sublimate." The result was that he did not get his chloride.

PYROGALIC ACID AS A POISON.—At an inquest held at Ryde, I.W., last week, it was shown that the deceased, a child about two years old, had somehow got possession of a bottle containing a solution of pyrogallic acid for photographic purposes. The post-mortem examination clearly proved that the acid was the cause of death, but the medical man in attendance has surely been incorrectly reported in the local newspaper, which represents him as stating that "a grain and a half of pyrogallic acid was sufficient to cause the death of a man."

THE USE OF GAS CYLINDERS.—The Secretary of State for the Home Department has requested the following gentlemen to inquire into and report on the manufacture, filling, and use of gas cylinders—viz., Professor C. V. Boys, Professor H. B. Dixon, Dr. A. Dupré, the Rev. F. J. Smith, and Professor W. C. Unwin. Mr. Robert F. Reynard, of the Home Office, will act as secretary to the Committee.

PHOTOGRAPHIC EXHIBITION.—The prospectus of the fortieth Annual Exhibition of the Royal Photographic Society has been issued. The judges this year are: In the art section, W. L. Colls, Colonel J. Gale, F. Hollyer, R. G. Wilkinson, and W. L. Wyllie A.R.A.; in the technical section, Captain Abney, Chapman Jones, F.L.C., F.C.S., and Andrew Pringle, F.R.M.S. The exhibition will be inaugurated on Saturday, September 28, by a private view, followed in the evening by a conversations, and will remain open until November 14. The Council has this year decided to issue an illustrated catalogue in the place of the usual one, reproducing in it a selection of the pictures best calculated to convey an idea of its appearance, otherwise there is no important alteration in the lines upon which it will be conducted. The exhibition will, as usual, be held at 54, Pall Mall East, and particulars can be obtained from the Secretary at the Society's new offices at 12, Hanover Square, W.

NEW CHEMICAL SOCIETY AT MILAN.—It is reported that a new institution has lately been formed in Milan for the encouragement of the study of chemistry and the furtherance of chemical industry in all its branches, under the style of the Società Chimica Milano.

FLÜCKIGER MEDALS.—At the last meeting of the Flückiger Fund Committee at Constance, it was decided, says the Apotheker Zeitung, that in future only gold medals should be struck, and that they should be awarded every five years from 1897 onwards. The award will be made by the Committee, and the medal will be delivered to the recipient by the German or Swiss Apotheker Verein alternately, at their annual meetings. The interest accruing from the Fund is to be devoted either to a travelling stipendium, a prize, or a grant for scientific work, but only in large sums at considerable intervals. As the Fund amounts to only 10,000 francs, an increase by donations is much wanted. The Committee will meet henceforth every two years at the meeting of the German or Swiss Apotheker Verein alternately.

ANTICANCER SERUM.—Emmerich and Scholl claim to have prepared an anti-cancer serum from sheep's blood. The observation frequently made that the appearance of erysipelas was followed by disappearance of cancerous growths led to the discovery of the serum, which is to be supplied soon by Dr. Scholl, Thalkirchen.

BACTERIOLOGY OF CLOTHES.—Dr. Leitz, of Munich, says the British Medical Journal, has found as many as 955 thriving colonies of bacteria on a worsted stocking that had been worn, and 712 on a cotton sock. A glove accommodated about thirty-three colonies, and a piece of woollen stuff twenty. The micro-organisms found were mostly non-pathogonic forms, the others being staphylococcus. The typhoid bacillus was found in one case, however, on clothing that had been worn between three and four weeks, the staphylococcus pyogenes albus occurred in clothes that had been worn nineteen days, and the anthrax bacillus found in clothes was still virulent after a year.

"GOODFREY'S CORDIAL" FOR INFANTS.—According to the local report of an inquest held at Shrewsbury on May 31, a chemist and druggist of that town was asked to treat a child, nine days old, whom, however, he did not see. He supplied some "Goodfrey's Cordial," the bottle being properly labelled, but the mother appears to have neglected the printed directions, and the result was that the child died from the effects of an overdose of opium. The coroner expressed the opinion that a great mistake was made in giving opium cordials to children, but thought there was no reflection against the chemist. He also remarked that he hoped he would in future not dispense (prescribe) for children without seeing them. It would have been better, perhaps, if the coroner had said that it would be wiser for the chemist to refrain entirely in future from prescribing for children.
BACTERIOLOGICAL INSTITUTE IN DUBLIN.—The Boards of Guardians of a large number of Irish unions having adopted a resolution inviting the Irish Local Government Board to take the necessary steps to establish a Pasteur Institute in Dublin, the Local Government Board is now collecting information as to the amount of public money expended in sending poor patients to the Paris institute, and it is anticipated that there is considerable likelihood of the suggested Institute becoming an accomplished fact.

PEPPYS’ DIARY AS A MEDICAL GUIDE.—Dr. D’Arcy Power, in an address to the Aberdeen Medical Society, has taken advantage of the fact that Pepys, in his classical work, has dissected himself so completely, and carries the process further, laying bare the famous old time servant’s psychical weaknesses as thoroughly as he has himself exhibited to the world his many physical infirmities. Pepys had inherited a tendency to stone in the bladder, and discourses at length upon his varied symptoms, the result being that certain extracts from his ‘Diary’ are so blunt and outspoken as to be considered by the Lancet unfit for publication even in the pages of a medical journal.

INCIDENTS IN A CHEMIST’S LIFE.—Under the title of ‘Struggles and Incidents in the Life of a Chemist,’ Mr. Robert White, pharmaceutical chemist, of East Finchley, has published a small volume embodying a brief autobiographical notice and a number of interesting and amusing reminiscences of life in the United States, California being the scene of many of his earlier adventures. The little book should prove of considerable interest to Mr. White’s friends, whether pill-rollers or not, and it may easily serve to while away pleasantly a leisure hour.

MARIGNAC MEMORIAL LECTURE.—The June number of the Journal of the Chemical Society contains a lecture by Professor P. J. Cleve, on the life-work of Jean Charles Galissard de Marignac, a former Foreign Fellow of the Society, who died on April 15, 1884. The chief amongst Marignac’s researches were probably those on the rare earths, but he also did important work on the chemistry of minerals, and in physical and analytical chemistry. The lecture, as published, is illustrated by a fine half-tone print, and Professor Cleve concludes his account in the following terms: Modest, patient, and unassuming, transparent in character and honest of purpose, with no other conception of his calling than that of pursuing truth for truth’s sake, Marignac lived wholly for science, and no man has served her with a purer or more unselfish devotion. If the world of science is the poorer by his loss, it is the richer by his example.

MONUMENT TO LAVOISIER.—The Times, according to the Nouve Vremps, has approved of the opening of a subscription throughout Russia for the erection of a monument to the great French chemist, Lavoisier.

English News.

[Readers are invited to send local information of pharmaceutical interest. When newspapers are used in paragraphs to be noted should be plainly marked, while cuttings should be verified by the addition of source date.]

ROYAL BOTANIC SOCIETY.—Professor George Birrslow delivered a lecture to the Fellows of the Royal Botanic Society and visitors at the Garden, Regent Park, last week, on “A Century of Progress in Botany.” He showed specimens of the original wild plants from which some of the most admired garden flowers have arisen, and illustrated with unusual diagrams the various stages in the way of cultivation and hybridization they have passed before reaching the perfection of to-day. While the changes from the, in many cases, insignificant wild flower had little short of marvellous, there was a limit beyond which they could not go; and he wished to see some few of our florists’ flowers, that limit had indeed been reached.

PRESCRIBING BY A CHEMIST.—An inquiry was held at Southampton, on May 28, relative to the death of Lester James Dumper, aged three years, lately residing with his parents in Andrew’s Terrace. Emily Dumper, mother of the deceased, said her husband was employed as cook at one of the hotels in Fort Elizabeth, South Africa. Her child was taken ill with a cold on the last day, and she gave him medicine procured from a chemist in East Street, who prescribed the medicine for the child. Between three and four on the last morning deceased became worse, and Dr. J. Russell was sent for. He was never recovered, and it died about eight o’clock. Forbes Russell stated that he was in attendance on the child early on the Monday morning. It was in a state of collapse; in fact, it was dying. The child was examined with the stethoscope. It had acute congestion and croup. He asked the note why a medical practitioner had not been called sooner, and she replied that she did not think it so serious. The cause of death was due to congestion of the lungs. A verdict of death from natural causes was returned. The coroner advised the mother to stay away for the future when she had a child ill to call medical aid at once, and not to rely on a chemist.

PHARMACEUTICAL STUDENTS AT MORPETH.—Thursday, May 30, a party of over twenty students from the North of England School of Pharmacy, Newcastle, accompanied by Mr. G. F. Mason, principal of the school, made a botanical excursion to Morpeth. On arrival the party was met by Mr. T. Schofield, ex-Mayor of Morpeth and local secretary of the Pharmaceutical Society, who had kindly arranged for the arrangements for the students to visit several places of interest in the neighbourhood. In the course of the Chapel Woods were explored; then, after luncheon in turn, were visited Newminter Abbey Ruins, Ford Castle (where the group was photographed), Mr. John Gibbon of Hexham, Mitford Hall, and the greenhouses at Spital Hill. Lastly, after a substantial tea, provided by the host of the Earl Grey, they departed, Mr. Edward Hopper’s unique collection of orchids was visited, the party returning to Newcastle after a splendid day’s outing at 9 p.m.

PRACH-KERNEL OIL has an odour of bitter almonds and benzaldehyde may be extracted from it, by shaking with a solution of sodium bisulphite (see J. Ph. v. Elze-Lothr.)
Scotch News.

IMMUNITY AGAINST COBRA VENOM.—At the twelfth ordinary meeting of the Royal Society, Edinburgh, for the present session on Monday, June 6, the Hon. Lord McLaren, Vice-President, took the chair, and a communication on the effect of the long-continued and gradual increase of the dose such animals as rabbits could be rendered immune to such enormous doses as fifty times the minimum lethal dose. The animals not only showed no symptoms of poisoning, but had actually considerably increased in weight. It was also shown that the serum of immune animals possessed the power of protecting non-immune animals against it least as much as four times the minimum lethal dose. This was found to be the case in a series of experiments in which the serum was hypodermically injected thirty minutes after the animal received a dose fatal to a rabbit. The symptoms had shown themselves. So small a quantity as 1/250th part of a cubic centimetre of serum was an effectual antitoxin against the minimum lethal dose per kilogramme of body weight. At present a horse is under treatment with a view to obtaining a large supply of antitoxin serum for a more extended series of experiments. The author found that the best form in which to have the serum for use was to evaporate it in vacuo over sulphuric acid and reduce it to powder. In this form it retained its properties apparently for an indefinite period, and the serum could be readily produced by the simple addition of water. To this powder the author applies the name “Antivenem,” and when a sufficient quantity is obtained he proposes to examine it chemically, with a view to separating the active principle or principles. It was found that an animal immunised against one serpent venom was also protected against other serpent venoms. In one case protection was found to have lasted for a period of twenty days.

In the course of the paper it was mentioned that the author had found one serpent venom, of which he used chiefly that of the cobra, much more deadly than even aspoine, stephanin, or skoanthein, the latter being the most deadly poison of any he had hitherto experimented with.

Irish News.

IRELAND MEDICAL ASSOCIATION.—At the meeting of the Irish Medical Association, held in the College of Surgeons, Dublin, on Monday, the 3rd instant, the President, Sir William Stokes, in the chair, a report was submitted from the Council of the Society which referred, amongst other matters, to the subject of the condition of Irish workhouse infirmaries.

Dr. Ninian Falkiner gave a resolution to the effect that the condition of those infirmaries—according to a report which had been submitted to the Council by Dr. Moorhead, of Coolhills—called for earnest attention and speedy reform. Dr. Moorhead seconded the resolution, and remarked that the position of the Irish workhouse medical officer was peculiar. He had neither house nor home. No doubt he assumed authority at times, but if he did it was ultra vires, and he was liable to be pulled up for it at any time. He was bound to report to the guardians defects of diet, drainage, ventilation, overcrowding, etc.; but when he did so he was generally abused in a scurrilous manner. If he wanted peace and quietness his best course was to go round at twelve o'clock, make up a few bottles of medicine, make no reports, and ask for nothing; and if he did not attend to the sick it did not very much matter.

Dr. Falkiner said that in England a short time ago a Commission was appointed to inquire into the condition of the Poor Law infirmaries of that country, and very few of them had been found fit to stand the test.

The President said it should be remembered that the defects in question did not exist in all the Irish workhouse infirmaries.

Dr. Falkiner’s resolution was amended so as to refer to “many” Irish workhouse infirmaries, and was passed nem. con. The concluding part of the resolution requested the Council of the Society to call the attention of the Irish Local Government Board to the subject.

Patent Office Business.

APPLICATIONS FOR PATENTS.

From the Illustrated Official Journal (Patents.)

No. 9438. Improved printing silver nitrate paper for photographic purposes and process of preparing same. May 13.

No. 9543. Improvements in and relating to sappho tables and the like for surgical use. May 13.

No. 9572. Improvements in disinfectants. May 16.

No. 9706. Improvements in or connected with chloriform and other anesthetic inhalers or nozzles for animals. May 16.

No. 9715. Improved vessel for delivering liquid in drops and case thereof. May 16.

No. 9789. An improved instrument or apparatus for extracting cork from the interior of bottles, jars, and like vessels. May 17.

PATENTS PUBLISHED MAY 18.

Reducing metals from oxides or sulphides (Vantin, C. T. J.)—The inventor finds that the great affinity of aluminium for oxygen or sulphur at high temperatures may be utilised for reducing chromium, iron, tungsten, titanium, molybdenum, nickel, cobalt, uranium, vanadium, “glimmer,” and other metals from their oxides or sulphides. The compound is mixed with powdered aluminium in the finest possible state of division, and the fusion is conducted in a vessel lined with fire-clay, magnesia, etc. Fibre-spar, cryolite, or other flux may be added. The metal obtained is practically pure, and the heat produced by the reaction
is sufficient to fuse it, even in the case of chromium. No. 8806 of 1894.

[We understand this is the process which Prof. Roberts-Austen has been showing at the Royal Institution and elsewhere lately.]

Preserving milk, cream, etc. (Casse, W. F. E.).—The milk, etc., is contained in a metal vessel enclosed by a larger vessel, in which water is placed and then frozen. A non-conducting casing envelopes the outer vessel, and pins are affixed to the inner vessel to hold the ice and prevent it from breaking down as it melts. No. 11,933 of 1894.

Para-methoxy and para-ethoxy-phenyl-urea (Imray, O., communicated from the Farberwes, formerly Meister Lucas und Bring).—A solution of para-oxophenylurea in alcohol, is rendered alkaline with caustic potash solution, and ethyl iodide is added. After boiling, and distilling off the alcohol, the para-ethoxy-phenylurea may be crystallised out. The bromide or other salt of ethyl might be used. When preparing para-methoxy-phenylurea, the treatment is similar, but methyl iodide or other methyl salt is used instead of the ethyl compound. The caustic potash may be replaced by alkaline earths, ammonia, lead oxide, etc. No. 17,008 of 1894.

Treating sulphur waste (Albright, G. S., and Hood, J. J.).—The partly purified sulphur or sulphur waste obtained from gasworks, etc., is suspended for some time in a closed vessel at a temperature slightly below the boiling point of sulphur. The volatile constituents such as ammonia, etc., pass off, and are collected, while such hydrocarbons, etc., as do not distil at the heat used, react upon the sulphur with evolution of sulphur dioxide, hydrogen and deposition of carbon. After standing about six hours, the sulphur may be distilled off. No. 11,988 of 1894.

Filter (Breyer, F.).—Relates to a filter which frees the water from microbes, but removes none of its gaseous constituents. The filtering medium consists of a number of porous lenticular bodies covered with a textile fabric coated with an asbestos composition. This is pressed into the fabric a fine paste of asbestos fibres and then drawing through it a solution of sodium silicate. The inventor states that the filter removes all micro-organisms, and that it is readily cleansed by brushing. Another filtering compound for arresting micro-organisms is described. It is insoluble in the above-named surf ace, and consists of finely divided asbestos, kaolin and common salt or other salt. No. 5759 of 1895.

Filter (Davenport, J. J.).—Comprises a filter by which the water produced by melting ice is filtered from any impurity in the ice. The lower portion of the vessel is divided into two compartments by a slab of filtering stone or other material, and the ice placed in the vessel passes as it melts, through the slab into one of the compartments, from which it may be withdrawn by a tap. No. 5764 of 1895.

Washing compound (Coulter, F. E.).—Comprises a detergent compound of all or some of the following ingredients mixed together in stated proportions and in a special manner:—Paraflin, cera alba, oleum galithemum, oleum cassia, carabolic acid, and alcohol. The product is stated to be pearl-white and solid, and to remain hard at a summer heat. No. 5743 of 1895.

Filtering dust, etc. (Rein, H., and Lübke, F.).—Filter to be used in the filtration of milk to remove sand, dirt, etc., for the preparation of children's food. The milk is poured upon a conical piece surrounded by a series of concentric sieves of increasing fineness, the outermost being the finest. The whole apparatus revolves at a speed of two or three hundred revolutions, so that the milk is driven through the sieves by centrifugal force, and is thus rapidly filtered. No. 6906 of 1895.

Poisoning Cases and Inquests.

Strychnine.—Louis Hemingway, aged 37, died on Saturday, May 18, at 26, Cable Street, Lancaster, from the effects of strychnine contained in a rat-poison, self-administered. Verdict: "Suicide while in an unsound state of mind."

Prussic Acid.—John Richard Bowdon, aged 50, died on Monday, May 20, at Croydon Road, Fenge, from the effects of prussic acid, self-administered. Verdict: "Suicide during temporary insanity."

Arsenic.—Albert Hodges, aged 2, died at Enfield from the effects of arsenic, contained in a sheep's-meat mixture given by its mother in mistake for brimstone and treacle. At the adjourned inquest held on Monday, May 20, a verdict of "Death from an adventur" was returned.

Laudanum.—Jane West, aged 71, died on Friday, May 25, at 40, Hambro Road, Streatham, from the effects of laudanum, self-administered. Verdict: "Suicide whilst mentally deranged."

Pyrogallic Acid.—An inquest at Ryde, on May 29, on the body of a female child, aged two years and three months. Dr. Alfred Banks, K.R.C.S., deposed that the mother brought the child to him at nine o'clock on the Monday morning. It was then in a state of collapse. She also brought two bottles, one being labelled "Pyrogallic Acid," and the other "Sulphuric Acid." There were a few drops of fluid in the bottles. He prescribed for the child, telling its mother to give it a warm bath and stimulants, and saw the child again at three in the afternoon. It was then no better, being dangerously ill. It had symptoms of poisoning from the first, and after death he made a post-mortem examination which entirely confirmed his suspicion of pyrogallic acid. The kidneys were extremely congested, the lower part of the right being quite black. Every appearance denoted poisoning. There was no organic disease. The poisoning was undoubtedly the cause of death. This acid will not necessarily have taken effect before the Monday, but it had a good time to get into the blood. 1½ days were quite what one would expect. The contents of the bottles were such as were used in photography, but sulphate of soda was not poisonous. A grain and a half of pyrogallic acid was sufficient to cause the death of a man (!) Verdict: "Accidental death."

Carbolic Acid.—Samuel Lloyd, aged 48, died at Saturday, May 25, at Underwood Street, Chertseymore, Medlock, from the effects of carbolic acid, self-administered. Verdict: "Suicide whilst insane."

Laudanum.—Eliza Constance Jorgenson, aged 6, died on Saturday, May 25, at 35, Peterborough Road, Fulham, from the effects of laudanum, self-administered. Verdict: "Suicide whilst temporarily insane."

Aconite, Belladonna, and Chloroform.—Mrs. Hallis, aged 62, died on Thursday, May 23, at Queen's Road Gosport, from the effects of aconite, belladonna, and chloroform contained in a liniment, self-administered. Verdict: "Suicide while in an unsound state of mind."

Rat Poison.—Annie Randall, aged 25, died on Friday, May 31, at Shenton, near Lichfield, from the effects of a rat-poison, self-administered.
Notes and Queries.

[The information given in this column includes both notes of practical interest to pharmacists, and replies to queries which seem to possess sufficient interest to readers generally.]

DRESSING FOR RUBBET LEATHER.

[878.] The Drugists' Circular gives the following formula:—Soft soap, 4 drachms; linseed oil, 6 drachms; bunter colouring, 2 ounces; beeswax, 6 drachms; turpentine, 2 ounces; water, 2 ounces. Dissolve the soap in the water and add the butter colouring. Melt the wax in the oil and the turpentine, then gradually stir in the soap solution, and keep stirred until cold.

FUMIGATING PAPER AND POWDER.

[879.] The following aromatic solution (Pharm. Cent.) is useful for perfuming writing paper, blotting paper, or plain wood sawdust for fumigating purposes. Either of these materials are macerated in the following tin-ture and dried:—Crushed benzoin and tolu balsam, each 50 parts; styrex, 10 parts; are exhausted by 300 parts alcohol. Dissolve in the filtrate 10 parts Pern balsam, 1 part of oil of cinnamon, and 1 part of oil of lavender.

DISPENSING DIGITOXIN.

[880.] In administering digitoxin, which is very insoluble in water, care must be taken that the vehicle is so adjusted in alcoholic strength that re-precipitation does not take place in the stomach, or a cumulative physiological action from successive doses may result. According to Corin, this may be avoided by dispensing digitoxin as follows:—Digitoxin, 2 to 3 milligrammes; chloroform, 6/10th cubic centimetre; alcohol, 90 per cent, by volume, 12 cubic centimetres; distilled water up to 150 grammes. One-third part to be taken for a dose (Repert, de Pharm., after Scalpel.)

IMPURITY OF ASAFOETIDA.

[881.] The amount of ash in a sample of asafoetida should always be determined before purchasing. The following results have been recently obtained:—

- From Powdered asafoetida "superior strained" 53-7 per cent. of each.
- Powdered asafoetida in mass "superior quality" 40-8
- Powdered asafoetida, strained 50-4
- in tea 2-08

(PHARM. WEEKBLAD.)

BISMUTH TRIBROMOPHENOEN.

[882.] This substance, which has frequently been alluded to as an antiseptic, is, according to v. Heyden's patent, prepared as follows:—Thirty parts of tribromophenol are dissolved in a mixture of 150 parts of water and 4 parts of caustic soda, and 12 parts of bismuth nitrate added. The precipitate is freed from excess of tribromophenol by washing with spirit, the residual bismuth tribromophenol containing about 50 per cent. of bismuth oxide.

PRESERVATION OF WHOLE FRESH FRUITS.

[883.] Petit advocates the following method for preserving whole fruits, such as grapes, etc. (Pharm. Zelt.) He takes a large cask, inserts a false bottom made of laths, and covers this with rough wood shavings; on this he places the fruit, after having put underneath it a bowl containing pure alcohol. The cask is then securely closed. After three months the fruit is found to be still in perfectly sound condition. The author considers that the alcoholic vapour exercises this preserving influence.

New Remedies.

[The notes given under this heading, for the information of dispensers, embody recent suggestions in therapeutics, and cover both new drugs and preparations, and old ones under new aspects. The word "parts" is used to represent parts by weight, both for solids and liquids.]

PAPAIN FOR EXPULSION OF TENSION.—Dr. Bartholow succeeded in expelling a parasite seven metres long in an obstinate case of Tenia solium which had resisted all other methods of treatment, by means of doses of six decigrammes of papain (about 10 grains) given three times daily after each principal meal. Papain exerts a toxic action on the parasite, so that it becomes detached from the mucous membrane of the intestine and is expelled by the peristaltic movements (La Médic. Mod.)

BAD EFFECTS OF CHLORALOSE.—Dr. Rendu引用 a case in which an injection of 25 centigrammes of chloralose into a tuberculous patient was followed by alarming symptoms; two hours the patient was comatose and apparently moribund, but recovered under injections of ether, followed by morpine. In an editorial, La Médicine Moderne recalls five or six similar cases published in that journal last year, following the use of 20 to 40 centigrammes of chloralose in cachexia. Similar cases have also been brought before the Société de Thérapeutiques. A Russian physician observed bad symptoms in two out of seventeen cases of insanity treated with the drug (Univers. Méd. Jour., new ser., vol. III., p. 101).

CINNAMON IN DYSENTERY.—Surgeon-Major Ate-tooan has found the administration of a bolus of a draught of powdered cinnamon bark taken morning and evening, washed down by a mouthful of water, very successful in thirty cases; observations were extended over a period of two years, ordinary cases were cured by one or two doses, the worst by six administrations (Lancet, March, 1886).

[These results would render the trial of cinnamon oil or causia oil in doses so interesting; the therapeutic result would probably be the same, and would obviate the necessity of swallowing a large amount of inert "woody fibre."]

UNFAVOURABLE COMMENT ON LOSOphan.—Dr. Abbot Cantrell, of Philadelphia, thus concludes an inquiry into the value of losophan in his dermatological practice. It proved entirely inefficacious in almost every disease of the skin. Ten cases was cured in one instance, but after two months' treatment. It gave a slight idea that it may be useful in cancer. He concludes his note thus:—"I think it a waste of time for anyone to make use of it in treating diseases of the skin") (Therap. Gaz., [3], vol. xix., p. 221).

CANTHARIDES IN LEUCORRHEA.—Slooom has obtained good results with a combination of cantharides and ferric chloride thus:—Tincture of cantharides, U.S.P., 96 minims; tincture of ferric chloride, 160 minims; dilute phosphoric acid, 160 minims; syrup of lemon, 2 fluid ounces; water, to 4 fluid ounces. One teaspoonful in water after meals (Phil. Polycl., after Therap. Gaz. [3], xix., 276).

BORAX IN RHINITIS.—Musebold employs a solution of borax in glycerin diluted with water, so that it can be sprayed, by means of a few drops in various forms of rhinitis. The solution is made thus:—Glycerin, 7 parts; borax, 2 parts; distilled water, 3 parts (Rev. Intern. de Med. et de Chir., 1895, p. 169, after Deutsch. Med. Woch.)
Notices, Letters, and Answers to Correspondeats.

COMMUNICATIONS FOR THE CURRENT WEEK'S JOURNAL SHOULD REACH THE OFFICE, 17, BLOOMSBURY SQUARE, LONDON, W.C., ADDRESSED "EDITOR," NOT LATER THAN THE FIRST POST ON WEDNESDAY. TELEGRAMS CAN BE RECEIVED ON THURSDAY MORNING. TELEGRAPHIC ADDRESS: "PHARMACEUTICAL JOURNAL, LONDON."

ADVERTISEMENTS (except for the "Exchange" column), orders for copies of the Journal, and instructions from Subscribers respecting transmission of name, should not be addressed to the Editor. Loss or delay will be caused. See directions on Editorial page.

Correspondents who wish notices to be taken of their communications must write in ink on one side of the paper only, and should authenticate the matter sent with their names—of course not necessarily for publication. No notice can be taken of anonymous communications.

Drawings for Illustrations should be done with pen and ink (Chinese), and consist of clean, sharp lines, without shading. They should also be sent twice the desired size, so as to allow for reduction.

Names and Formulae should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

"*" Queries should be addressed "Editor," and will be replied to as early as possible after receipt. answers of sufficient general interest being given under the heading Notes and Queries.

LETTERS.

PRESCRIBING BY CHEMISTS.

COXUBISAYS:—"Apparehtly Dr. Wynn Wescott is greatly disturbed by the sales of chemists. He reminds me very forcibly of the stags in Richmond Park at certain seasons, when they are trumpeting and pawing the ground in a most ludicrous manner. Don Quijote charging the windmill is not it. Certainly the Medical Defence Association ought to give him a good refresher. Perhaps, in the near future the doctor will turn his attention to his own profession, who more frequently recommend 'patent' (proprietary) medicines than chemists, and with much less knowledge of their composition. I wish particularly to call his attention to that portion of the medical profession who dabble in law, acting as legal assessors to the panel of twelve men and true, thus usurping the position of solicitors without satisfying the Society of their competency and getting placed on the rolls. Such dabbling is very 'unorthodox.'"

SULPH. PRECIP. IN CONF. SULPHURIS.

Mr. O. W. CATFORD, of Crowsnest, writes as follows:—"In view of the numerous suggestions put forward for the projected revision of the Pharmacopoeia, possibly a suggestion which I have made to some prescribers in my own locality, and has been favourably received and acted upon by them, may be deemed worthy of a place in your columns. I refer to the substitution of precipitated for sublimed sulphur in confl. sulphuris. It makes a preparation more elegant from the pharmaceutical point of view, pleasant to take for the patient, and as far as I can learn from several prescribers who have adopted it on my suggestion, at least equally efficacious therapeutically. This congestion in my experience is regaining favour after being comparatively neglected for some years, and if it can be made more palatable without impairing its efficacy, 'so much the better.'"

ANTI-EXTREME CUTTING.

MESSRS. ELLIMAN, SONS AND CO. WRITE AS FOLLOWS:—"There are several indications which suggest that we might now successfully put forward a plea for co-operation, this being sometimes necessary to get at the indirect buyer who resists to roundabout ways in order to obtain supplies. Such a person could be dealt with effectually, and if three or more manufacturers whose sales are large would co-operate with us for the purpose of tracking the supplies of the cutter of the preparations of any one of us, we, the associated firms, could prove the anti-cuttins terms of business can be made abandoned successful, when more would probably join in the movement. It would not be necessary for the associated firms to deviate from their anti-cutting terms in force, nor disclose any detail of their business. Namely. Shortly, 1. When the preparations of any one of the associated firms were proved by essays to be sold under the minimum prices the accounts of the wholesaler who had supplied the cutter would be closed by the associated firms, so that the wholesaler could not prove that the cutter had agreed with him not to sell his agreement prices, and also not to make the goods to make person without securing a similar agreement; 2) Indirect buyer who cuts would be dealt with effectually by being dealt with upon which need not be made public, which by co-operation is certain of success. We have only three reported cases of cutting in hand at the moment, and these being cases of obtaining supplies directly, co-operation is desirable to settle them quick. The sources of supply of a dealer obliged to obtain articles by roundabout ways could be more easily put at by co-operation than the sources of one article only and it would be a serious matter for any firm to have supplies of several leading preparations stopped."

ANSWERS.

C. F. J.—It is probably the outer tune or medium scales of a Crinums.
A. BERTHELTON.—Your appreciation is well come. By the way, what is the Society you name?
JONN MITCHELL.—Your communications have been received.

W. E. MILLER.—The remainder of the evidence is to bad no direct bearing upon pharmacy proper, set as hardly worth finding space for in the Journal. Witness you refer to doubtless know what is a talking about when he expressed the opinion there is a considerable amount of direct bearing on the grocery trade, but was on less safe ground in calling in question the capacity of medical men and pharmaeutical chemists, and his evidence may safely be ignored.

HAROLD COLEMAN.—Many thanks for your assistance.

METHOD OF INTERPOLATION.

In the previous description of the correction of a thermometer reference has more than once been made to the method of interpolation for extending the corrections to intermediate points; a short account of this method will now be given.

In using a thermometer the temperature to be measured may be anything within the range for which the instrument is graduated, and the mercury may consequently stand at any point. We require, therefore, to know what the correction to be applied at any point amounts to. It is obviously impossible, however, to ascertain directly the correction for every point; if we found the error at each several degree mark we might still have to read a temperature lying between two such marks, and so on; and similar remarks, of course, apply to any other instrument. The assumption is therefore made that the increase or decrease in the error between two neighbouring points takes place gradually and evenly, and that the alteration in the error at any intermediate point will be proportional to its distance from the point at which the error is known. For instance, if the correction at $5^\circ$ is $0^\circ-8$, and at $10^\circ$ it is $1^\circ-2$, it is assumed that at $7^\circ-5$ it will be $1^\circ-0$, at $9^\circ$ it will be $1^\circ-12$, and so on. Such an assumption is warranted by what we know of the slight changes in diameter in passing along a glass tube, and is fully justified by the correctness of the results obtained by its means. But the points of direct observation must not be too far from each other; if at $5^\circ$ the correction is $0^\circ-8$, and at $25^\circ$ it is $1^\circ-2$, we cannot therefore assume that at $15^\circ$ it will be $1^\circ-0$, for in the distance from $0^\circ$ to $25^\circ$ there may be more than one distinct change in the bore of the tube, and such changes may augment or neutralise each other. For a thermometer stem intervals of $5^\circ$, as in the example given, lead to sufficient accuracy for all ordinary purposes.

b. Corrections of Fixed Points.

| $0^\circ$ | +$0^\circ-30$ | $100^\circ$ | -$0^\circ-10$ |

What has here been said of interpolation in the correction of thermometers applies not only to the correction of other instruments, but also to very many measurements that are not of the nature of corrections. For instance, 100 parts of water dissolve $53-5$ parts of potassium bromide at $0^\circ$, $64-6$ parts at $20^\circ$, $74-6$ parts at $40^\circ$, $84-7$ parts at $60^\circ$, etc. Here the solubility clearly increases almost exactly in proportion to the rise in temperature, and we are justified in assuming that at $10^\circ$, 59 parts will be dissolved; at $30^\circ$, $69-6$ parts; at $50^\circ$, $79-6$ parts, and so on; and these assumptions are shown to be substantially correct by experiment.

GRAPHIC REPRESENTATION.

But it would be very troublesome to have to calculate each intermediate value in any such series by a sum in proportion, and the need for doing so is avoided by recourse to the graphic method of representing results. Two sets of parallel and equidistant lines are drawn, cutting each other at right angles, as in Figs. 1, 2 and 3. The intervals between these lines are assigned definite values, distances from left to right representing one series of quantities, and distances from top to bottom the other series. This will be made more intelligible by the following examples:

![Figure 1](image)

In Fig. 1 the corrections for the bore of a thermometer stem are represented by the irregular line. The distance between any two of the transverse lines represents one-tenth of a degree, while that between any two of the vertical lines stands for $5^\circ$ measured on the stem of the thermometer.

The corrections for the points $5^\circ$, $10^\circ$, $15^\circ$, etc., up to $100^\circ$ having been found as described before, a mark is made on the vertical line representing $5^\circ$, where it is crossed by the line representing the numerical value (0:25) of the correction at this point, or in this case midway between the lines representing 2 and 3, and similarly the corrections for the other points are put in. When the correction has to be added to the scale-reading to give the right temperature, it is shown above the line marked $0^\circ$; when it must be subtracted it is put below that line. If all these points are now joined by a continuous line this will show in the same way the corrections for intermediate points; for instance, when $7-5$ is read on the scale we see that 0:27 must be added; if 38 be read, 0:48 must be subtracted, and so on.

So far, however, we have only dealt with the corrections for unevenness in the bore. To obtain the complete correction, the corrections at $0^\circ$ and

* Paper ruled in this way can be obtained of any apparatus dealer.

Vol. LIV. (Third Series, Vol. XXV.), No. 1303.
100° are indicated on the same or a similar chart; if the points representing these are joined by a straight line the proportionate correction for any point is at once shown. To avoid the need of adding together two corrections for every point when using the chart this should be done once for all for points distant by 5°; by plotting in the same way the composite corrections so given, a curve like that of Fig. 2 is obtained, and once the solubility of the salt in question at any intermediate temperature. In all curves of this kind distances measured from left to right are called abscissae, and vertical distances are called ordinates, measuring in every case from the zero line.

There is another important application of curve of this kind. Any quantitative experiment, either physical or chemical, is always liable to give a slightly erroneous result; this is partly due to the limits of accuracy of the instruments used and to imperfect observation; but with the most perfect instruments and the greatest care there still remains in general a small residual error. As this is just as likely to be on one side of the truth as the other, it is got rid of or reduced to negligible dimensions by making several determinations of the quantity in question, and taking the mean value of the results.

FIG. 2

This shows at a glance the necessary correction to be added or subtracted for every reading of the thermometer between 0° and 100°. The curve of corrections for the bore only is given in this example in order to make every step plain. But it is clearly not necessary that this curve should be drawn at all, as it is not needed in constructing the final curve.

In Fig. 3 the solubility of potassium bromide in water at different temperatures is represented, starting from the data given above. Vertical distances here stand for temperatures, and distances from left to right indicate the number of parts of the salt dissociated by 100 parts of the solvent. On the line representing 0° a mark is made at the point corresponding to 53.5 parts; on the line representing 20° another mark is made at the point which indicates 64.6, and so on with the other data. On drawing a line so as to connect all such points it indicates at

FIG. 3

But it is also possible to use one value to correct another, even when they are readings of different quantities. For instance, the values found by Regnault for the vapour pressure of water at different temperatures are represented graphically in Fig. 4, the abscissae showing the temperatures, and the ordinates the pressures, in any suitable units. It is here clear that the pressure rises with the rise of temperature; but if the points are joined, the line so obtained is sinuous and irregular. It is not supposed that such irregularities actually occur just at the points that have been chosen for observation and at no others. On the contrary, there is the greatest probability, amounting practically to a certainty, that the increase is regular and should be represented by a regular curve. The sinuosities thus arise due to the residual errors of observation, and since these errors will be as often on one side as the other, the most probable true curve will leave as many of the points on one side as the other, as shown in the figure. In the plotting of curves, then, the greatest correctness is not obtained by joining by straight lines the points that have been marked, but by drawing a continuous curve that shall pass through as many as possible and leave others as often on one side as the other. Such curves are drawn by means of flexible rulers; these are made in various ways, one of the most useful forms being a strip of fairly thin steel with a lead backing fastened to it. It is infrequently happens that a distinct break occurs in a curve which is not due to error, but represents an alteration in the law of change of the quantity in question. The different parts of the curve are then drawn separately with the flexible ruler, and meet at the "points of flexion" or breaks.

For the most perfect interpolation the algebraic equation representing the law of the curve or of the part of it in question is ascertained, and from this formula any of the intermediate values can be found exactly; but as this process requires some
knowledge of higher mathematics it will not be considered here.

**Specific Gravity.**

We can now leave the subject of the plotting of curves and pass on to the measurement of some other physico-chemical quantities. It will be convenient to deal next with specific gravity.

The specific gravity, or as it is more correctly but less frequently termed, the relative density, of a substance is the ratio borne by the weight of a certain volume of it to the weight of an equal volume of a standard substance under similar conditions; that is, the ratio of its density to the density of the standard substance. In the case of solids and liquids the standard substance always employed is water, and the most important condition is temperature; for gases either hydrogen or air is taken as a standard, and the pressure on the gas at the time of experiment is another important condition.

As has been just stated, for the determination of the true relative density of a substance, both it and the standard substance should be at the same temperature. It is, however, sometimes more convenient or useful to compare their densities at different temperatures. The temperatures employed should always be recorded, and are written thus: — 15°/15°, 100°/15°, etc.; the temperature of the substance in question being put first, and that of the standard (water, air, or hydrogen) second. Thus, if the relative density of a substance is recorded thus, "e.g. 15°/15° = 1.1435," the meaning is that any given volume of the substance at 15° weighs 1.1435 times as much as an equal volume of water (if dealing with a solid or liquid), also at 15°; "e.g. 100°/15° = 1.1412" indicates that a given volume of the substance at 100° weighs only 1.1412 times as much as an equal volume of water at 15°. Some lack of uniformity prevails as to the temperature at which specific gravities are determined. That most commonly employed is either 15° C. or 60° F. (15°-60° C.), but determinations are also made at 4° C. (the temperature at which the density of water is greatest) and at 0° C. It is most convenient to employ the temperature 15°-5° C.; this can always be readily obtained in the laboratory.

The specific gravity of liquids is usually determined by means of the specific gravity bottle; as, however, the method is generally described in textbooks, together with the common method of finding the specific gravity of solids by displacement of a liquid, it will not be necessary to discuss either here. But it frequently happens that it is required to determine the relative density of a liquid of which the quantity available is too small for the ordinary bottles, or of a solid which is only obtainable in powder or small crystals; recourse must then be had to other means.

The most useful vessel for finding the specific gravity of a liquid is the Sprengel tube. This consists of a glass tube constricted in the middle by drawing out, and bent into U shape, the ends being bent nearly at right angles to the wider portion, as shown in Fig. 5.

This may be made of any size that is convenient; for the larger sizes it is best to grind small glass caps to fit the ends, while the smaller sizes may be closed when required by sealing the ends in the flame. A fine line is drawn on one arm (a), by scratching with a diamond or a file. The tube is first weighed empty and dry, being hung on to the arm of the balance by a wire; pure water is next drawn into it so as to fill it from the extreme end of the one arm to the mark on the other; it is then allowed to stand in a bath of water at 15°-5° until it is exactly at that temperature, any excess of its contents being removed by bringing a slip of filter paper to the end of the full arm until the liquid in the other stands just at the mark; or any deficiency being made up by inclining it till the liquid just reaches to the end of the plain arm, then bringing a drop of the liquid on a glass rod to this end, and inclining the tube in the other way until sufficient has been drawn in. For the sake of accuracy it is best to always slightly overfill and draw a little out; the meniscus is then always turned the same way. After carefully drying and weighing, the water is emptied out and the tube dried again; the drying may be hastened by rinsing out first with alcohol and then with pure ether, slightly warming, and drawing air through. The liquid under examination is then put in, brought to 15°-5° in a bath, and the whole again weighed. Deducting the weight of the empty tube from the two weights last found gives the weights of equal volumes of water and of the liquid in question.

With careful adjustment of the temperature, specific gravities correct to four decimal places may be found by the Sprengel tube with moderate quantities of liquid, while only a small error in the fourth place is involved, even when the quantity is very small. In filling the original form of Sprengel tube described here, it is necessary to invert the tube while sucking the liquid into the first limb, reversing its position in order to fill the second, to avoid leaving any air in. The necessity of the reversal is avoided in the form suggested by Ostwald, shown in Fig. 6; this is filled in one position by dipping 6 into the liquid and sucking at c.

Where less accuracy is required, a convenient apparatus is a 1 C. c. pipette having very fine tubes. The liquid is brought to the proper temperature and then drawn into the tube up to the mark; the pipette is laid on a wire frame (Fig. 7) and weighed. The weight of the empty pipette and frame being known, the additional weight represents the specific gravity of the liquid.

To find the specific gravity of solid substances that are in small fragments a convenient and accurate way is to prepare a liquid of the same density and ascertain the latter as above. The test by which the densities of the solid and liquid are shown to be the same is that the solid should remain suspended in any part of the liquid.
able liquids are mixtures of water and saturated solution of barium mercuric iodide, by which any density from 1·0 up to 3·5 can be obtained, and of benzene and methylene iodide, having a range of from 0·9 to 3·3. Other liquids are suitable in special cases, and the one chosen must, of course, not act chemically upon the solid. The latter is powdered and introduced into a mixture whose density is judged to be about the same. According as the particles sink or float, more of the heavier or the lighter component is added until the particles remain indifferently in any part of the liquid; the relative density is then found by any of the methods for liquids.

Owing to the extreme delicacy of the method, it will not be easy to reach exactly the point described, but it is sufficient if only very slow movements of the particles take place. In general, the small fragments will not all show the same behaviour, and the heaviest will in all probability be the purest; if, at least, the substance is crystalline, since crystals are liable to enclose cavities or small quantities of mother liquor, either of which would make them too light, while there is no probable contamination that would make them too heavy.

(To be continued.)

GENERAL MEDICAL COUNCIL.

On Thursday, June 6, at a meeting of the General Medical Council, Sir Richard Quain, Bart., presiding, the following report of the Pharmacopoeia Committee was presented:

"The Pharmacopoeia Committee has to report that applications for information bearing on the production of the new edition of the British Pharmacopoeia have been sent to twenty medical authorities, and that from sixteen of these communications of great value have been received.

"The Therapeutic Committee of the British Medical Association has sent in a memorandum which furnishes important information as to the frequency with which a considerable number of official drugs and preparations are used by the members of that Association. The Pharmaceutical Society has supplied the Committee with an instructive report and statistics, and Mr. Martin Dale has forwarded a pamphlet in which the number of times certain drugs and preparations appear in twelve thousand prescriptions is stated. Information of value has likewise been received from other persons on various subjects. The Pharmacopoeia Committee have, on behalf of the Council, thanked the various medical authorities and other bodies and persons who have sent in reports and communications bearing on the production of a new Pharmacopoeia.

"In the last report of the Pharmacopoeia Committee it was stated that, in reply to communications addressed by the Lord President of Her Majesty's Privy Council through the Colonial and Indian Offices to the medical and pharmaceutical authorities in the colonies and in India, asking for suggestions as to the revision of the British Pharmacopoeia so as to adapt it to the requirements of these countries, many communications had been received.

"Professor Attfield has summarised these communications. He has likewise made for the use of the Pharmacopoeia Committee a summary of the suggestions of the various medical authorities. The Committee has, therefore, before it information from a very large number of sources, arranged in a very convenient form for reference.

"Dr. Tirard has been invited, and has consented, to act as Secretary to the Pharmacopoeia Committee and to render assistance to the President in matters relating to the preparation of the new edition of the Pharmacopoeia.

"The Pharmacopoeia Committee deems it desirable to obtain the services of scientific Referees in Chemistry and Botany, to whom points of difficulty in connection with these sciences may be submitted, and, subject to the consent of the Council, proposes to invite Mr. Thistleton Dyer, C.M.G., F.R.S., and Mr. Holmes to act as Referees in Botany. It also proposes to ask Dr. Thorpe, F.R.S., to act as Referee in Chemistry, or Dr. Russell, F.R.S., if Dr. Thorpe be unable to accept the invitation of the Committee. The Pharmaceutical Society of Great Britain has, at the request of the Medical Council, appointed a Committee of Pharmacists to assist the Pharmacopoeia Committee in the work of revision. A list of questions bearing on Pharmacy has been drawn up by the Pharmacopoeia Committee for reference to the Council of the Pharmaceutical Society.

"The Pharmacopoeia Committee likewise deems it desirable to obtain the services of recognised authorities in Pharmacology and Therapeutics, to whom points of difficulty in connection with the properties of particular drugs and preparations may be referred, and proposes that Dr. Landen Brunton, Prof. Fraser, and Prof. Walter Smith be requested to act as Referees for this purpose.

"The Pharmacopoeia Committee has already held three meetings during the present Session of the Council, and, in order to deal adequately with the materials before it and to consider the preparation of the first draft of the new Pharmacopoeia, the Committee proposes to hold a meeting in London towards the end of July.

"Prof. Attfield has submitted his Ninth Annual Report on the Progress of Pharmacy during 1894, and the Committee directs that the same be printed, and that an Index to the whole series be prepared.

"June 5, 1895."

On the motion of the President the report was received and entered on the minutes:

Dr. HERON WATSON: May I ask a question with regard to this report? I see that communications have been received from the various bodies represented on this Council, that is to say, the British Medical Association, the Pharmaceutical Society, and the individuals who sent in reports and communications, and that they have been thanked for doing so. Have the papers which have been sent in been printed?

The President: Yes.

Dr. HERON WATSON: And may I ask if they have been presented to the Council?
The President: I think so. I think they ought to be sent to the Council and to the various bodies.

Dr. Heron Watson: As far as the report makes mention of anything, there is no statement to that effect in the report.

The President: I think the documents are of a very satisfactory nature, and I think they ought to be sent to all the bodies, and to the members of the Council. The expense cannot be very considerable; they are in print, and I hope the Council will consent to that course.

Dr. Heron Watson: I also wish to ask if there is to be any supplementary report of the Pharmacopoeia Committee, because there is one point which was re-committed to it.

The President: We only aim at doing what is right and proper. If any further information is sent it certainly will be accepted.

Dr. Heron Watson: It may be remembered that the Report of the Pharmacopoeia Committee was re-committed on December 4, 1894, upon an amendment moved by Dr. Tuke and Sir William Turner, and that one of the subjects re-committed was a question in regard to the sum of £1250 assigned to Professor Attfield for his services as Editor. The Council agreed to £300 being paid at once, but we expected from the Pharmacopoeia Committee a further report as to the question of £1250 being paid to the Editor. Is there any supplementary report from the Pharmacopoeia Committee?

The President: In that case the Committee would report. On what date was that?

Dr. Heron Watson: It was on December 4, 1894.

You will remember a statement was made in connection with the supplementary report. The Committee merely sent in a memorandum stating generally that it was ready to fall in with the requirements of the Council in regard to the questions put forward.

The President: Nothing has been done in that respect with regard to Professor Attfield's appointment and salary. Since then he has been very hard at work, and we owe him thanks for his most admirable summary and condensation of these papers.

Dr. Heron Watson: I should be the last person to doubt it. I am merely speaking to a matter of order. The matter of order is, that the question was re-committed, and we have no report on it from the Pharmacopoeia Committee.

The President: I do not know that you re-committed the question of Dr. Attfield's salary.

Dr. Heron Watson: That certainly is my impression.

Dr. Leech: May I point out that it was alluded to, but not mentioned in the second report sent in by the Pharmacopoeia Committee?

The President: It is not in the report; it was struck out before the report was adopted.

Dr. Leech: It was alluded to, but not mentioned in the report.

Dr. Heron Watson: The Report of the Pharmacopoeia Committee, which was sent in on December 5, 894, says that "the Committee has taken note of the opinions expressed in the Council on the question of associating Professor Attfield, or one or more persons conversant with the subject other than the Pharmacopoeia Committee. The question as to whether it is necessary or practicable will be carefully considered by the Committee, and will be reported upon to the Council at its next session." Now, that question has not been reported upon to the Council at the next session. A further question was the readjustment of the funds if any such change was made, and I looked vain to see what the arrangement was which the Pharmacopoeia Committee had to propose. I found no such statement, and I now ask again, sir, whether it is the intention of the Committee to send in a supplementary statement in regard to this question at some more suitable period?

The President: It was not thought to be necessary.

Dr. Heron Watson: I suppose that those persons who are mentioned—Mr. Thesilton Dyer, Mr. Holmes, Dr. Thorpe, and Dr. Russell—are to receive some payment, and if so, is there to be a separate vote from this Council for that purpose, or is the £1250 to cover it?

The President: That was to be the salary which Professor Attfield was to be paid for all the work he did.

Dr. Heron Watson: That was one of the subjects which was disapproved of when the question came up before the Council. That subject was re-committed, but I believe I am speaking accurately when I say that it was agreed that £300 should be paid to him at once, because it was for work which had been done. The question then remained open as to what was to be done with the remainder of the £1250.

The President: That was the salary which he accepted; he said he would not accept less. Therefore the Committee has appointed him to do the work, and he has gone on doing it. If it were referred back to the Council, you might get us into trouble.

Dr. Heron Watson: I should be the last person to do anything to get the Council into trouble or put the Chairman of the Committee to any inconvenience. There is nothing said in this report in regard to the matter, and before the report is absolutely passed, all I wish to do is to ask these two questions, and more particularly to know whether or not it is proposed to make any communication to the Council on this subject of the salary which is to be paid in future to Professor Attfield, because I wish you to bear in mind that undoubtedly while the £300 was voted to be paid to him at once, we were to receive a further report upon the subject of the remaining £950.

The President: We have been following the precedents of former cases. In the first part of the year there were three sums of £500 given over to that Committee to do as it liked with. We have had £100 a year given over to us to do as we pleased with, and it was left to the Pharmacopoeia Committee to decide what the amount of work was and how it was to be remunerated. You will see in this report we recommend the employment of a number of people, but put down no payment or salaries for them. You must trust the Pharmacopoeia Committee to use the funds of the Council as if they were its own. You have
pleased the money at the disposal of the Committee. Of course you are at liberty to go into the payment of each case and accept it or refuse it, but if that question of Dr. Attfield's payment is to be raised, I will ask you to say what payment shall be made to all the members in advance. I really appeal to the Council to place confidence in the Pharmacopoeia Committee. It will do the best it can. It has taken great pains in the matter.

Dr. Heron Watson: I should be sorry to express the smallest want of confidence in yourself, sir, to whom we owe so much, or in any member of the Pharmacopoeia Committee, who, I am sure, has done an immense amount of work, or in Prof. Attfield, who, I believe, has been the backbone of a great deal of the work, which could not well be done by anybody else. All I speak to is a question of order, and the question of order is that while we are told that money has been voted in larger or smaller sums on previous occasions to this Committee to do what it pleased with, it is distinctly stated at page 165 of the Minutes of last year that the Committee recommends to the Council that [a sum] £1250 should be assigned to Prof. Attfield for his services as Editor; £500 to be paid to him at once; and I submit that when this report was re-committed, so that it might be re-considered by the Committee, it was so stated that the Council was quite ready to assent to £500 being paid to Prof. Attfield at once, and it was understood that we were to receive from the Committee further information and a further report with regard to the remaining portion of the sum.

Dr. Leech: I shall be glad to move that the report be adopted. During the last session a great deal of work has been done by the Pharmacopoeia Committee, and I have no doubt that the appointment of Dr. Tirard will greatly facilitate the work. As is well known, the Pharmacopoeia has also to deal with chemistry and botany, and it is suggested—I hope it will be adopted—that men who are well known in chemistry and botany should be appointed to aid the Pharmacopoeia Committee. No better names could be brought forward than those named in the report; Dr. Thorpe in Chemistry, and Mr. Holmes and Mr. Dyer as Referees in Botany. Then we have got a promise of a large amount of aid from the Pharmaceutical Society, which in former times has also given us great help. With regard to pharmacology and therapeutics, it will be seen that Dr. Lander Brunton, Professor Fraser, and Professor Walter Smith have been asked to act as referees in those subjects. There is no doubt that a great part of the Pharmacopoeia is connected with pharmacy, but questions in pharmacology and therapeutics must arise, and I believe we have the best help we can get. In regard to what has been said about payment, I would point out that although the suggestion was made that the amount was rather large, no resolution was passed, and when the report was re-committed no resolution was made on the subject. I presume the payment will stand. With regard to payments to others we hardly know yet what amount of work will have to be done. I think it was generally agreed that we should wait and see what amount of work was done before we arranged as to payment.

The President: I ought to mention that there will be a considerable payment to the Pharmaceutical Society for the work it is expected to do. We cannot tell beforehand; you must trust to your Committee. We have employed the best Editor we can get, and we have offered him the smallest salary he will accept.

Mr. Brudenell Carter: I have great pleasure in seconding the adoption of the report.

The report was then unanimously adopted.

THE APPROACHING REVISION OF THE BRITISH PHARMACOPEIA.

MEMORANDUM ON THE BRITISH PHARMA-
COPEIA

BY THE THERAPEUTIC COMMITTEE OF THE BRITISH MEDICAL ASSOCIATION.

D. J. Leech, M.D., F.R.C.P., Chairman.

Nestor Tirard, M.D., F.R.C.P.

As it has been announced that a new edition of the Pharmacopoeia is in course of preparation, the Therapeutic Committee thinks it desirable to set forth its views concerning certain points which seem to it to require special attention.

It is proposed to adopt the new edition of the Pharmacopoeia to the use of our colonies and dependencies by introducing alternatives to many of the drugs now official, suitable to their varying requirements. Besides this, it will be necessary to make official many of the therapeutic substances recently introduced and not infrequently employed, and also some of the new forms in which medicines are now commonly administered.

Yet an increase of the size of a Pharmacopoeia is to be deprecated on several grounds. A bulky Pharmacopoeia, abounding in detail and containing not only the medicines in general and common use, but also those occasionally employed, may serve some purpose as a work of reference; but it is not likely to be used as such by the members of the medical profession, for it cannot contain the exact kind of information they require.

Moreover, a Pharmacopoeia of large size will not be used in the daily work of the practitioner, for he will not bear in mind its contents. The greater the amount of unnecessary detail it contains, the less will he use it.

Further, although it is quite true that the Pharmacopoeia is not written with any educational view, so far as the student is concerned, yet the relation of the Pharmacopoeia to medical education has an important bearing on its employment by medical men. The knowledge which a practitioner has of the Pharmacopoeia is largely dependent on the extent to which his work, whilst a student, is associated with it. But the numerous claims on the time and memory of the medical student and the size of the present Pharmacopoeia have caused some examining boards to require
A knowledge of only a portion of the drugs and preparations now official, thereby implying that the remainder are of such little value as not to require attention.

Other examining boards, on the contrary, make all the substances and preparations in the Pharmacopoeia the subject of examination, notwithstanding that a not inconsiderable number of them have admittedly fallen into disuse.

If the present Pharmacopoeia be increased in bulk there is some probability that it will be even less employed than heretofore.

The Pharmacopoeia is primarily intended "to afford to the members of the medical profession and those engaged in the preparation of medicines throughout the British Empire one uniform standard and guide whereby the nature and composition of substances to be used in medicine may be ascertained."

The body of the work should include all such remedies as the existing state of medical practice requires. It should contain the methods of preparation in so far as these are of service to the medical profession and those engaged in the preparation of medicines, with the weights and measures by which they are prepared. It should contain, too, descriptions of the remedial agents included, such as may afford a clear indication of what they are intended to be, and enable those engaged in their administration to determine their identity and purity; yet it should be of such size that it may be fully known and used by the members of the medical profession in their daily work, and it should, if possible, be so arranged as to form the basis of that information concerning drugs which medical men require to fit them for their daily work.

With the view of fulfilling these requirements in the new edition three modifications are necessary: (i), elimination; (ii), alterations; (iii), additions.

I.—Elimination.

Elimination may be carried out in three directions: (1) By the omission of drugs now but little used, and of superficial galenical preparations. (2) By the exclusion of methods of preparation of medicinal substances found in commerce. (3) By the omission of other details which seem of no value either to chemists or medical men.

(1) Omission of Drugs and Galenical Preparations.

It has been often said that whenever it is suggested to omit a substance from the Pharmacopoeia someone is sure to assert that this is a drug which he finds very serviceable. This may be true; but it does not seem a sufficient reason for retaining drugs which are not in common use, since the omission of a drug from the Pharmacopoeia in no way prevents a practitioner ordering and obtaining the drug for his patient. The older remedies ought no more to be retained because they are much used by a few individuals or even in a few localities than new remedies ought to be introduced for the same reason.

The Committee has deemed it desirable to make a systematic inquiry as to the extent to which certain drugs and preparations have fallen into disuse, and into the comparative frequency of employment of some compounds which possess similar properties. For this purpose a list of the principal drugs and galenical preparations concerning which information was needed, has been submitted to the members of the British Medical Association, with a request that each member should indicate whether he uses these drugs often, rarely, or never. Of this list 12,490 copies have been issued, and about one-half have been returned; the replies from 5609 have been available, and have been tabulated as follows:

### Exclusion of Methods of Preparation

In a large number of cases the Pharmacopoeia gives the method of preparation of substances met with in commerce and never prepared by the pharmacist. Some of the methods given are not in all their details applicable when the substances are prepared on a large scale; and there is reason to believe that in such cases the pharmaceutical processes are not adhered to.

In the pharmacopoeias most recently published—for example, the Swiss, German, and American—methods of making chemicals used medicinally are almost entirely omitted. It would certainly be desirable in the forthcoming Pharmacopoeia that the methods of preparing such substances as citric acid, tartaric acid, hydrochloric acid, phosphoric acid, and similar chemicals should be omitted.

### Omission of Unnecessary Details

The Pharmacopoeia contains certain lists—for example, acetates, chlorides, etc.—which seem of no service either to those who prescribe or those who prepare medicines. These might well be omitted.

### Alterations

**Origin and Source of Drugs.**—It is desirable not only that the origin, source, and general characteristics of drugs should be accurately described, but that in many instances the description should include their histological characters.

The mode of preparation of nearly every preparation in the Pharmacopoeia should be carefully considered in order that preparations of the greatest pharmacological activity may be employed.

The methods of making some of the extracts might be improved.
save much trouble if a general formula were given for
the preparation both of decoctions and infusions.

The hypodermic injections require special con-
ideration both with regard to their strength and
composition.

The pill masses of the Pharmacopeia should be less
bulky than they are; the same amount of active
material might in many instances be combined with
a smaller bulk of excipient.

The tinctures might be made more active and
reliable by a careful determination of the menstrua in
which the active principles of drugs are most soluble,
and a careful examination should be made to see how
far a standardisation of certain tinctures can be

The formulae for many of the licences require re-
consideration.

Many of the ointments are unsatisfactory. It seems
probable that two or three bases for ointments might
be introduced suitable for various purposes according
to their melting point. If this were done several of
the present ointments might be omitted.

Tests for Purity.—The tests for the recognition of
the purity of drugs in the Pharmacopoeia are in need
of complete revision. Chemistry has made considerable
advances since some of them were introduced, and it
is desirable that they should be replaced by others in
accordance with present chemical knowledge.

Dosage.—The doses in the Pharmacopoeia are in
many cases unsatisfactory, and require careful super-
vision. It is very necessary that they should be
revised by therapeutic experts.

Weights and Measures.—The metric system of
weights and measures should be introduced, the

equivalent in avoidrops weight and imperial measure
being added as alternatives. In the Pharmacopoeia
for 1885 a great advance was made by the parts and
fluid parts of the materials used in galenical com-
ounds being given in many instances, as well as the
weights and measures in grains and ounces. The
principle then adopted might be still further extended.
The general employment of the obole centimetre for

liquids and the gramme for solids as in the American
(U.S.) Pharmacopoeia might with advantage be adopted.

III.—ADDITIONS.

Alternatives for the Use of Colonies and Depend-
encies.—It is doubtless desirable that information con-
erning the use of drugs in the colonies and depend-
encies should be obtained, but the Committee suggests
that it is unadvisable to delay the publication of a
new pharmacopoeia on that account. The alternatives
to be employed might be issued at a later date as an
appendix.

New Preparations of Old Drugs now Official.—
Whilst it may be necessary to adopt some of the new
preparations now in general use, care should be taken
to incorporate only those for the admission of which
some definite pharmaceutical or therapeutic reason
exists.

In one or two directions it is manifest additions
must be made to the preparations in the Pharma-
copeia. For example, it contains an abundance of
colouring syrups, but comparatively few compounds
for giving pleasant flavour to medicines. It will pro-
bably be necessary, too, to make official some of the
more convenient and portable forms of medicine
which are now commonly used by the profession. The
large 5 grain pills of the Pharmacopoeia have been, to
a great extent, superseded practically by the small
pillule and granule, and medical men now often carry
with them medicines in these portable forms.

NEW DRUGS.—Much difficulty will be found in
deciding on the claims of the large number of new
agents recently brought before the notice of the
medical public. They can scarcely be decided upon
the extent to which these various new remedies have
been employed, since this is to some extent deter-

mined by the energy with which they have been
advertised.

Before deciding on the introduction of new reme-
dial agents, it would seem very desirable that special
information concerning their actions, uses, and doses,
should be obtained from those accustomed to phar-
maceutical and therapeutic investigations.

Note on Proprietary Articles.—In previous editions
proprietary substances have been introduced under a
new name, for example, phenazone (antipyrine); at
	times, also, imitations of proprietary articles that
have attained celebrity have been inserted into the
Pharmacopoeia under the same or another name.

Both courses are open to grave objections. If a
proprietary preparation be adopted, it seems hardly
worth while to change its name. The introduction of
imitations is attended with two difficulties; if the
process given follow closely that which is used for
making the proprietary article, a patent may be in-
fringed.

On the other hand, if the process employed differ
from that by which the proprietary article is obtained,
the pharmacopoeial product may be inferior, and the
proprietary preparation may continue to be used. It
must be confessed that the question of the proprietary
compounds is full of difficulties which can only be
solved by seeking the aid of experts.

The Committee also feel that as few new synonyms
as possible should be introduced into the Pharmacopoeia.

In the opinion of the Committee it is highly desir-
able that there should be a Medical Editor in addition
to the Pharmaceutical Editor, and that there should
be associated with them a Committee of those having
special knowledge of pharmacology and therapeutics.

THE HYDROGEN WALL IN ELECTROLYSIS.—To
obtain a greater efficiency in the reduction of the
highly electro-positive metals, such as potassium, from
aqueous solutions, Mr. L. Pjëke, at the recent Royal
Society soirée, showed the "hydrogen wall" (Elec-
trical Engineer). He produces an amalgam of the
metal under reduction by placing the mercury
cathode in a porous vessel. The amalgam is in its
richest condition at the top of the porous vessel,
which is the part furthest removed from the liquid.
The precise action of the device is said to be the pre-
vention of the liberation of hydrogen at the electro-
lytic contact surface.
FIXED OIL OF CARAPA GUIANENSIS.

BY E. H. GANE.

Some time ago I received from Mr. E. M. Holmes, curator of the Museum of the Pharmaceutical Society of Great Britain, a sample of fixed oil obtained from the seeds of the above-named plant, with the request that I would examine and report on it. The sample in question had been exhibited at the Colonial and Indian Exhibition, and had been presented to the Museum by Mr. C. Fresson, of British Guiana, from which country the oil was obtained. The oil is reputed to possess anthelmintic properties, and to be a powerful insecticide; it is used by the Warau Indian women for anointing the hair, and popularly known as "crab oil," a term which may refer to its insecticide properties, or possibly be a corruption of the word carapa.

The genus Carapa belongs to the natural order Meliaceae, an order more or less allied to the Rutaceae, and containing several plants which yield valuable timber, the principal being the mahogany tree. The tree grows in Guiana to a height of from 60 to 80 feet, and yields a timber which takes a fine polish, and is used for ornamental work. The bark of the tree is used by the Indians as a febrifuge, and is said to be equal to quinine for that purpose. It is astrignent, of a deep red colour, and very bitter. The seeds contain no endosperm, but have each two large oily cotyledons, and on expression yield the fixed oil readily.

The oil is liquid at temperatures above 20° C., but solidifies below that point to a creamy consistence, and if strongly cooled hardens considerably, but leaves a liquid oily portion intermingled, with the solid lumpes. The liquid portion is prinicipally olein. The oil had, when I received it, a peculiar, somewhat rancid odour and a nauseous bitter taste. The specific gravity at 15° C. is 0.923. On warming with water acidulated with acetic acid the bitter principle is removed from the oil, and the aqueous solution precipitates with the usual alkaloidal reagents, showing that the bitterness is due to an alkaloid or alkalolide. Mineral acids do not remove the bitter principle, from which I conclude that it is hydrolysed by strong acids, and subsequent experiments tended to confirm this. The amount of alkaloid present, however, was too small to enable any definite statements to be made. Free fatty acid was present to a considerable extent in the sample, between 15 and 16 per cent, calculated as oleic acid. This was determined in the usual way by solution in alcohol and titration with semi-normal solution of soda, phenolphthalein being used as an indicator. A systematic examination of the oil was then made in the following manner:—One hundred grammes of the oil were saponified by alcoholic potash, a clear solution resulting, showing absence of unsaponifiable matter. The resulting soap was decomposed with dilute sulphuric acid, and the liberated fatty acids were boiled with successive quantities of water, using an inverted condenser, and finally distilled in a current of steam in order to separate the lower volatile fatty acids. The successive washings and the distillate were then collected and distilled to separate the acids, the successive portions being neutralised with semi-normal soda. The resulting salts were then isolated by evaporating to dryness and examined, and found to consist of sodium butyrate, with a faint trace of acetate. The total acid present calculated as butyric was only 6 per cent.

The insoluble fatty acids were then examined. The mixed acids were of a soft consistence, and began to melt at 23° C., but were not completely liquified until the temperature rose to 30° C. A definite weight was then exactly saponified with semi-normal soda in alcoholic solution, phenolphthalein being employed as an indicator, and the resulting soap transferred to aqueous solution, and the liquid precipitated with neutral lead acetate solution. The lead soaps were then washed with water and alcohol, and digested in ether to remove soaps of the oleic acid group. The ethereal solution was filtered off and the filter washed with ether till free from lead. The filtrate was then decomposed with dilute HCl, when oleic acid and its homologues will pass into solution in ether. The solution was washed, transferred to an open dish, the ether evaporated off, and the residue weighed. Subsequent examination showed it to be pure oleic acid.

The lead soaps insoluble in ether were then decomposed, and the higher fatty acids collected. The separation of these was a long and most tedious operation. The method employed was to dissolve to saturation in alcohol, and fractionally precipitate with magnesium acetate also in alcoholic solution. The solution and precipitation had to be performed some twenty-five times before a satisfactory separation could be obtained. The mixed acids were found to consist of stearic and palmitic acids, the former in great preponderance. No quantitative determinations of the two were made.

The aqueous solution after saponification and separation of the volatile fat acids was examined and found to contain glycerin and sulphuric acid alone. No other alcohols were detected. The constituents of the oil are then free fatty acid, glycerates of oleic, palmitic, and stearic acids, and a small amount of a bitter principle of an alkaloidal character. The latter is probably identical with the principle present in the bark of the tree. Experiments were also made to determine the physiological properties of the oil. Administered internally it possesses slight purgative properties, but the taste is too nauseous to admit of its employment as such. As an insecticide it is evidently of considerable value. Insects will quickly steer clear of it if it be daubed on trees frequented by them, and when made into a soap and the soap dissolved in water, and the solution used as a spray, it forms an efficient insecticide for greenhouse or outdoor plants. Prolonged boiling, however, destroys the activity of the resulting soap, owing to decomposition of the active principle by the caustic alkali. There is probably not a large field for the use of this oil in pharmacy, but for soap and candle making it might advantageously be substituted for some of the vegetable oils at present in use, particularly if it can be produced, as appears possible, at a reasonable cost.
TOWARDS AN IDEAL PHARMACY LAW.

More than a third of the latest number of the Apothecary is occupied by the draft of a proposed Pharmacy Law, in which the Editor, Professor Oscar Oldberg, has attempted to embody his views upon pharmaceutical education and legislation. At the outset care has been taken to emphasise the necessity of recognising the fact that, in America, no less than in this country, regulation of the practice of pharmacy by law is not possible except for the purpose of protecting the people and the public health. Accordingly, the title of the proposed Act is made to read, “An Act to Regulate the Sale of Drugs, Medicines, and Poisons, for the Protection of the Public.” Retail drug shops it is proposed to classify into three kinds, depending upon the qualifications of the persons in charge. Thus, individuals with good educational qualifications of the highest class are to be called “Registered Pharmacists”; those with moderate educational qualifications “Registered Assistant-Pharmacists”; and a still lower class, consisting of individuals possessing no special educational qualifications, “Licensed Druggists.” Drug shops of the first class would be complete pharmaceutical establishments where physicians' prescriptions could be compounded and all other kinds of pharmaceutical work done, a registered pharmacist being in charge, and the premises sufficiently well equipped for serving their legitimate purpose. A shop of the second class need have only a registered assistant in charge, but poisons and potent remedies generally may not be dispensed or sold there. If, however, at any time a registered pharmacist should take charge of such a shop it would, by virtue of the change in management, become advanced to the position of a first-class establishment. Finally, licensed drug stores of the third class would obviate the practical difficulty which certain Boards of Pharmacy are said to have experienced, in enforcing the requirements of pharmacy laws which insist that a registered pharmacist shall be in charge of every drug store, whether or not the business of that drug store warrants the requirement that a pharmacist of high qualifications should be in charge of it. By the adoption of this system, it is pointed out, it will be entirely practicable to insist upon sufficiently high qualifications for the performance of the most important pharmaceutical work, whilst less stringent requirements will serve in the case of individuals doing less important work, and all educational qualifications can be suspended for purely commercial traffic in such things as patent (?) medicines and ordinary domestic drugs.

With regard to apprentices or pupils, it is proposed that before entering upon the study of pharmacy they shall have graduated from a high school or possess a general education equivalent to that required for such graduation. They may also be required to have attained the age of eighteen years, and must prove to a Board of Pharmacy that they are fit and proper persons to become “Registered Students of Pharmacy,” the Boards being empowered to refuse registration to applicants known to be of very bad moral character, or to be drunkards, opium-eaters, etc. Subsequent to registration they must undergo a four years' course of training in pharmacy if they intend to take the highest qualification, two years in a drug shop of the first class and two at a recognised pharmaceutical school, so that no one would be able to become registered as a pharmacist of the highest class before he had attained the age of twenty-two years. A reasonable measure of compulsory special education is invariably to be followed by examination, whether the students be graduates of colleges of pharmacy or not. The examination successfully passed, the candidate would be entitled to registration as a pharmacist of the first class. If, however, he is content to become a registered assistant-pharmacist only, he can save one year's attendance at the school of pharmacy and may become qualified when twenty-one years old. The examination would also be more limited in its scope than that for the higher qualification, micro-chemical, organic chemistry, analytical chemistry, and pharmaceutical assays being omitted at the discretion of the Boards of Pharmacy. Annual licences would be granted in either case, the holders being entitled to renewals for the rest of their natural lives.

The key to the whole situation, according to Professor Oldberg, is that sufficient compulsory preliminary education is more necessary than all other requirements put together, and it may be remarked,
parenthetically, that there is good reason for believing that the same holds true for Great Britain. Evidence of this preliminary education being forthcoming, he sees no objection to registered students being permitted by law to assist registered pharmacists and assistant-pharmacists in doing technical pharmaceutical work. This, of course, would be essential to acquiring a practical knowledge of pharmacy as actually practised. Registered assistant-pharmacists, when employed in drug shops of the first class, would be permitted to dispense poisons or other potent remedies, but only when under the control of registered pharmacists of the first class. This regulation would be quite in accordance with British precedent, and could hardly be objected to with reason. With regard to licensed drug stores of the third class, they would, of course, only be permitted in localities where drug shops of the first or second class did not exist. The Board of Pharmacy for a given district would not only grant the necessary licences but also have the right to declare what substances should be regarded as constituting common or domestic remedies. As an argument in favour of dispensing with all educational requirements in the case of the proprietors of these stores, it is stated that retail druggists have of late complained of great hardship in being obliged to pass State Board examinations simply for the purpose of conducting a shop in which scarcely any real pharmaceutical work is done; and, of course, the distinction between different retail druggists and between different retail drug shops "must depend upon the character of their work from the standpoint of the art of pharmacy and protection to the public health, and not at all from the standpoint of commerce." A similar arrangement, it may be mentioned, exists in Victoria, where it is found to work very satisfactorily, but it is doubtful if any place in this country is so far remote from a pharmacy as to justify such a concession in a British Pharmacy Act. It is unnecessary to consider further the details of Professor Oldberg's draft Pharmacy Act, since enough has been said to illustrate its chief features. A perusal of the whole of its fifty sections, however, will be found of considerable interest to everyone interested in pharmaceutical education and legislation in English-speaking countries.

PRIEST AND MEDICINE-MAN.

In rude tribes, says Mr. Herbert Spencer in the Contemporary Review, it is difficult to distinguish between the priest and the medicine-man, their respective functions being commonly fulfilled by the same person. Thus, in different districts, the same persons are found acting as priests, jugglers, and physicians; quacks, jugglers, and priests; priests, magicians, and doctors; priests, prophets, and doctors; or fetchers, doctors, priests, and witch-finders. The origin of this union of functions is referred to the fact that the primitive priests and medicine-men both dealt with supposed supernatural beings. With the Nootka Sound people, "natural pains and maladies are invariably ascribed to the absence or other irregular conduct of the soul, or to the influence of evil spirits, and all treatment is directed to the recall of the former and to the appeasing of the latter." Again, in the case of the Okanagans, "the sickness becoming at all serious or mysterious, medical treatment is altogether abandoned, and the patient committed to the magic powers of the medicine-man." To quote other examples, the Tahitian doctors are almost invariably priests or sorcerers, and the Mongols seldom separate medicine and prayers, the medical function of the priest evidently originating in the belief that diseases are caused by angry gods, or indwelling demons who must be driven out of the afflicted patients.

The gradual evolution of the physician from the priest, properly so called, is shown to be concomitant with increased knowledge of medicinal agents, which gradually ceased to be regarded as acting supernaturally. The early civilisations show the transition, and also illustrate the differentiation of function that gradually took place. Egyptians, Babylonians, Assyrians, Chaldeans, Hebrews, Hindoos, Greeks, and Romans have all left conclusive and concordant evidence of the direction in which progress took place. The early Christians, too, were no exception to the rule, the pagan conceptions of disease and its treatment reasserting themselves in their case. In medieval France the clerical practice of medicine only declined when a papal bull permitted physicians to marry, and in this country, a statute of Henry VIII prohibited any person from practising as a physician or surgeon in or near London, "without examination and licence of the Bishop of London, or of the Dean of Paul's, duly assisted by the faculty; or beyond these limits, without licence from the bishop of the diocese, or his vicar-general, similarly assisted." Again, the division of medicine-men into physicians and surgeons seems to support the idea of the maintenance of a distinction of long standing; physicians originally dealing with evils inflicted by supernatural means, while surgeons treated injuries caused by purely mundane agencies.

Mr. Spencer further remarks that "it is alleged that down to the early part of our own century there remained with the Archbishop of Canterbury a latent power of granting medical diplomas." This power, however, was not only possessed but actually exercised in quite modern times. According to the Schedule (A) of the Medical Act (1858) amongst the persons entitled
to registration are those holding the degree of "Doctor of Medicine by Doctorate granted prior to passing of this Act by the Archibishop of Canterbury," and the "Medical Register," so recently as the year 1889, contained the following entry:—
"Crownin, Edward, Claremont House, Brixton, London, S., M.D. by Doctorate granted by the Archibishop of Canterbury, Sept. 13, 1858." This is of especial interest because Dr. Crownin appears to have possessed no other qualification. The degree was of practical value therefore in quite recent times, and not merely ornamental. The British Medical Journal states, also, that a holder of the Lambeth M.D. degree died only a few months ago. It seems fairly established, then, that our leading philosopher is not too far fetched in his ideas when he suggests that "the separation between 'soul-curer and body-curer,' which goes on as savage peoples develop into civilised nations, has but very gradually completed itself even throughout Christian Europe."

DOG POISONING.

There has been a good deal of correspondence in the metropolitan daily press of late on the subject of dog poisoning in country districts. The Poisoned Flesh Prohibition Act appears to be infringed continually, gamekeepers and others laying down poisoned flesh for the destruction of "vermin," and this flesh being frequently eaten by valuable dogs with fatal effect. Strychnine seems to be the favoured poison for the purpose, but it is either purchased at a distance or given away to avoid the necessity of registration. At any rate, local chemists are able to give no information respecting the matter.

Some light is thrown upon the question of supply by two correspondents of the Standard, who independently quote the experience of a Sussex veterinary surgeon. This gentleman received from a London firm of wholesale druggists a hamper which proved to be intended for a local farmer. The farmer was addressed as veterinary surgeon, and the recipient of the hamper being the only veterinary surgeon in the district, it was naturally delivered to him, as well as the invoice which came by post. An ounce of strychnine was amongst the goods, and the veterinary surgeon felt it incumbent upon him to direct the attention of the wholesale druggists to the fact that their customer was a farmer only. In reply they told him it was none of his business, and stated that they always executed prepaid orders to anyone who desired them to do so, "which was the custom of the trade."

That any such custom prevails in the trade it is unnecessary here to do more than simply deny. It may be well, however, to point out that sales of poisons of the nature of that cited, are distinctly illegal. The business of wholesale dealers in supplying poisons is only exempted under the Pharmacy Act, 1888, in so far as they supply them "in the ordinary course of wholesale dealing." Transactions with private individuals who require poisons for their own use are not covered by this exemption, and it is quite possible, therefore, that if satisfactory evidence of such illegal sales were forthcoming, the Pharmaceutical Society would be able to move in the matter and check a practice which is both unworthy of any respectable wholesale house and pernicious in its tendencies.

ELECTION OF NORTH BRITISH EXECUTIVE.

The large number of candidates for election to the Executive of the North British Branch of the Pharmaceutical Society affords a healthy indication of the great interest taken in corporate affairs by Scottish pharmacists. At the meeting on Friday next the result of the election will be announced, seventeen being selected from a list of twenty-eight. Voting papers must be returned by Thursday next, June 20.

PHARMACOPEIA REVISION.

The memorandum on the British Pharmacopeia issued by the Therapeutic Committee of the British Medical Association (see p. 1148), for a copy of which we are indebted to the courtesy of Dr. Tirard, contains matter of considerable importance in connection with the work to be carried out, and we are glad to have the opportunity of calling the attention of pharmacists to it. The points dealt with in the memorandum under the several heads of elimination, alterations, and additions, will naturally be of interest to pharmacists, and they should form material for comment, from the pharmaceutical point of view, with the general object of assisting in the production of a national pharmacopeia suited to present requirements. In that respect the statistical information collected by the Committee appears to suggest a possible elimination of articles from the Pharmacopeia which would reduce the bulk of the volume, besides leaving room for improvements in the definition of those retained, more in keeping with existing knowledge and conditions. We hope to receive communications on the subject for publication in the Journal.

TOXICITY OF FLUORIDES.

There is no doubt, says the Pharmaceutische Centralblatte, that the fluorides will soon find extensive application both as preserving agents for food and as antiseptic medicines. Their progress seems only to be checked by the fears entertained of their poisonous nature. Experiments made with animals, however, show that they can take immense quantities of fluorides with perfect impunity, and even after continued use no poisonous effects result. Tappeiner finds that although so-
dium fluoride is more poisonous than other alkaline salts, it would be necessary for an animal of one thousand pounds weight to swallow at least one thousand litres (beer refuse?) per day before toxic effects would ensue. He reckons that a fatal dose would have to consist of 0·5 Kilo. to each Kilo. of body weight. Goats and dogs have also been experimented upon, and given daily for three months from 0·3 to 0·5 Gm. sodium fluoride with their food, without being any the worse for their experience. In the case of the former the milk was even not in the least affected. The effects produced on human beings seem, however, much less favourable. A. G. BLOXAM (Chem. Zeits.) purposely consumed a piece of salmon which had been lying for three months in a five per cent. solution of sodium fluoride. After eating, salivation set in at once, followed by sickness and diarrhoea, and in the night the circulation became very slow. He estimates the quantity of sodium fluoride consumed to have amounted to about 5·5 Gm.

RE STAMPING WEIGHTS.

An important communication on this subject will be found at page 1158, where Mr. YENWALL draws attention to the fact that the practice of charging tradesmen for re-stamping weights, and presumably measures also, appears to be not in accordance with the statute, when the re-stamping is done without the owner's authority. The matter is of great interest to chemists, for the practice of re-stamping without permission is a very general one. So far as any opinion can be based upon the Weights and Measures Act itself, it would appear that any inspector who tells a chemist to have his weights, etc., stamped again, when they are not found to be false or unjust under the Act, is not entitled to claim any fee for such re-stamping, and any local authority which instructs its inspector to demand such fees is exceeding its powers. With regard to the repayment of sums already paid it remains to be seen what action will be taken by the various local authorities respecting other than quite recent charges, and those voluntarily incurred. The amount paid for re-stamping during past years must be considerable, and in individual cases it may be thought worth an attempt at recovery. It may be, however, that payment having been made in most cases without protest, it would be held that the action of the inspectors had been acquiesced in. At any rate, a decided stand should be made against the tendency to re-stamp weights and measures that are not false or unjust, since section 45 of the Weights and Measures Act, 1878, makes it quite clear that a weight or measure once duly stamped is not liable to be re-stamped unless found to be false or unjust, even if used in any other district than that in which it was originally verified.

ELECTION TO THE WELSH GIRLS' SCHOOL.

Mr. ISAAC T. LLOYD, of King's Road, Chelsea, communicates the pleasing information (see p. 1158) that MARY MARGARET LEWIS is one of the successful candidates at the recent election. As already stated on several occasions, many chemists have taken considerable interest in this case, and we have much pleasure in being able to announce that their efforts have at length proved successful.

Transactions of the Pharmaceutical Society of Great Britain.

DONATIONS.

At a meeting of the Library, Museum, School, and House Committee, held on Wednesday, the 12th inst., the Librarian and Curator presented the following reports of donations to the Society's Library, Museum, and Horarium:—

To the Library (London).

Royal Institution of Great Britain:—
Proceedings, 1894.
List of Members, 1894.

Professor E. Schaefer, Strassburg:—
Die Verfassung des Chlorhydrates mit Phenol und mit Stearorationen, etc., 1895.
Bemerkungen über unterschweflige (hydrorschwe- ngige) Säure, 1894.

Professor J. Wiesner, Vienna:—
Der Uppas-Baum, 1895.
Ueber die Epistemologie der Rinde und des Holzes bei den Tiliasen und Anonacese, 1894.
Beobachtungen über die Anisophyllie einiger tropischer Gewächse, 1894.
Bemerkungen über einen falschen Lichtgenuss der Pflanzen, 1894.

Professor Dr. R. Kober, Dorpat:—

Imperial Botanic Garden, St. Petersburg:—
Aota, tom. 13, fasc. 2, 1894.

Imperial University of Japan:—
Mittheilungen aus der medicinischen Faculität, Bd. 2, no. 2; Bd. 3, no. 1.

Pharmac Board of Victoria:—
Report for 1894.

The Government Printer, New South Wales:—
The flowering plants and ferns of N.S.W., by J. H. Maiden, part 1, 1895.

American Pharmaceutical Association:—
Proceedings, 1894.

University of London:—
Calendar, 1895.

To the Library (Edinburgh).

Mr. David MacLaren, Edinburgh:—

Pharmacy Board of Victoria:—
Report for 1894.

American Pharmaceutical Association:—
Proceedings, 1894.

To the Museum.

Dr. G. Watt, Calcutta:—
Dried papaw juice.

Mr. C. F. Moore, Dublin:—
A piece of cinnamon wood cut fifty years ago.

Mr. P. Squire, London:—
Fresh fruits of Indian bael.

Messrs. Schimmel and Co., Leipzig:—
Specimens of oil of cypress, Nigella sativa, Pecan-
danum officinalis, and neroli (artificial), guaiacum wood; 5inalo wood from Mexico, and Cay-
sene; anise bark, and Nim seed.

To the Herbarium.

Mr. F. W. Burbidge, F.L.S., Botanic Gardens, Trinity College, Dublin:—
Specimen of an asafoetida plant in flower.

Mr. J. P. A. Wilson, Johore:—
Specimen of the specieacchina plant cultivated at Johore.
Mr. T. Hanbury, F.L.S., etc.:—
Specimen of Phellodendron amurense in flower.
Proceedings of Societies in London.

CHEMICAL SOCIETY.

A meeting was held on Thursday, June 6, at Burlington House, the President, A. Vernon Harcourt, F.R.S., in the chair.

The following papers were read:

ON THE MOLECULAR REFRACTIONS OF DISSOLVED SALTS AND ACIDS.

BY DR. GLADSTONE, F.R.S., AND W. HIBBERT.

In 1870 (Journ. Chem. Soc., xxili., 101) it was shown that if the specific refractive energy of a liquid be represented by the formula \( \mu - 1 \) when \( \mu = \) refractive index and \( d = \) the density of the liquid, then this refractive energy is a constant not affected by temperature.

Further, if the refractive energy of solids be determined by solution in a solvent as water, the specific refractive energy of the solid body is not changed on undergoing solution, either in a saturated solution or on infinite dilution. The present investigation was undertaken in order to determine whether this law was rigorously true, or if it was only an approximation.

It was found that the number of solids which could be used in the investigation was limited, since most compounds are crystalline and give two or three indexes of refraction. Finally, about fifteen compounds were obtained which were subjected to examination. The results—the specific refractive energy and the dilution—were plotted as a curve with the ordinates of specific refractive energy \( \left( \frac{\mu - 1}{d} \right) \) and the abscissa of parts of water to one of the compound.

The effect of saturated solutions was first noted, and it was found that with acids such as hydrochloric, hydrobromic, and hydricid, there was a large increase in the specific refractive energy on passing from the liquid state to that of a saturated solution.

Acetic acid undergoes a similar change on solution.

In the case of salts as sodium chloride, etc., there is little or no change on solution, whilst with silver nitrate the change is in the opposite direction, viz., there is a decrease in the specific refractive energy on solution.

In the case of very dilute solutions it is probable that the above law is only approximately true. Acids (except acetic) and the chlorides do not obey the law, the refractive energy increasing or decreasing in certain instances as dilution proceeds.

Nitrites and sulphates, however, exhibit no change on dilution, whilst with sulphuric acid, though there is no change on initial solution, there is first an increase and then a decrease on increasing dilution.

These changes also occur in the case of the magnetic rotation, as shown by the results of Dr. Perkin.

The laws thus laid down in 1870 appear to be true only for nitrites, sulphates, and organic substances, whilst for other substances there is a slight deviation from the law. It is probable, however, that the refractive energy of compounds does not alter on solution, but that the alteration is due to chemical change in the compound itself, which is brought about by solution, and thus depends on the nature of the solvent.

Water of crystallisation does not affect the molecular refractive energy, and the change cannot, therefore, be due to hydration. The osmotic theory of solutions depending on the gaseous condition of the dissolved substance is not confirmed by this investigation.

The law first enunciated probably holds good within narrow limits for salts, but with larger variation in the case of acids, and the departure from the law is probably due to a re-arrangement of the atoms consequent on solution.

A COMPARISON OF SOME PROPERTIES OF ACETIC ACID, AND ITS CHLORO- AND BROMO DERIVATIVES.

BY S. PICKERING, F.R.S.

It was found, on tabulating certain physical constants as the boiling points, specific gravity, heats of fusion, of dissolution, etc., and the magnetic rotation of acetic, monochlor-, dichlor-, and trichlor-acetic acids, that there were certain regularities to be observed in the differences between the numbers of the different members of this series. In some cases, however, acetic acid is exceptional, and there is no similarity in the differences between acetic acid and the three chloroacetic acids.

In other cases, however, as in the case of the heats of fusion and the freezing points, there are points of similarity between acetic acid and the dichlor-acetic acid, on the one hand, and between monochlor-acetic and trichlor-acetic acids. The following table shows some of these cases:

<table>
<thead>
<tr>
<th>Acid</th>
<th>Boiling point</th>
<th>Heat capacity (specific heat)</th>
<th>Freezing point</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acetic</td>
<td>118°</td>
<td>32·63</td>
<td>169°</td>
</tr>
<tr>
<td>Dichlor-</td>
<td>194°</td>
<td>49·44</td>
<td>108°</td>
</tr>
<tr>
<td>Monochlor-</td>
<td>189°</td>
<td>40·36</td>
<td>61·2°</td>
</tr>
<tr>
<td>Trichlor-</td>
<td>197°</td>
<td>53·44</td>
<td>59·1°</td>
</tr>
</tbody>
</table>

In the course of the work four modifications of monochlor-acetic acid, differing only in their melting point, were obtained. In the case of the chlor- and bromo-acids, it is noted that the heats of dissolution are parallel except in the case of the monobrom-acid which, however, may be explained by assuming the existence of a similar set of isomers to monochlor-acetic acid.

The following papers were taken as read: "ββ-Dinaphthyl and its Quinones," by F. D. Chattaway, D.Sc., Ph.D.; "Action of Benzaldehyde on Phenyl Semiacetamide," by G. Young, Ph.D.; "Acid Compounds of some Natural Yellow Colouring Matters," by A. G. Perkin and L. Pace; "The Interaction of Sulphur and α-Nitronaphthalene," by A. Herzfelder, Ph.D.
SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting was held on Thursday, May 16, Mr. H. T. Durant, Vice-President, in the chair, and the following paper was read on:—

PLANT DISTRIBUTION.

BY J. ROBERT WALKER.

In dealing with this subject it is not my intention to give a detailed account of the floras peculiar to various countries, but rather to simply touch upon some of the leading principles of plant distribution. Plants, though possessing the means of spreading themselves over the greater part of the globe, are restricted from doing so indefinitely by various influences, of which the chief are climate and geographical drawbacks. We are aware that where a moist and cool atmosphere is essential to the growth of some plants, others do not flourish in such; or again, that whilst a tropical climate is necessary for the culture of many species, it is disastrous in its effects upon others. But though the requirements of heat or cold differ for the various species, all plants grow best within a certain range of temperature, and each has its own zero, below which it will not thrive. Excessive heat and intense cold have alike a destructive influence upon the plant.

Some botanists, of whom Meyen may be specially mentioned, have drawn up "zones of vegetation" based upon the climatal difference of bands drawn round the earth parallel to the equator and proceeding to the poles; but in such plans the varying altitude of the earth's surface has not been taken into account, hence there must necessarily be very uneven temperatures in different parts of any jone zone. For this reason these "zones of vegetation" have been abandoned, and what are known as "isothermal lines" are now used to indicate the regions of similar plant life, each line connecting spots on the earth's surface which have the same annual temperature, and hence the lines are not identical with the parallels of latitude.

It will be evident that plants growing on the summits of equatorial mountains are such as will also flourish at a low altitude in regions far away from the equator; indeed, in some cases, polar regions.

The type of vegetation existing in dry climates differs very considerably from that found in countries with a regular and constant rain-fall. In the former case we have the structure of the plants succulent in the interior, but their outer covering is tough and leathery—a provision against undue transpiration. Or the plants may be possessed of bulbs or fleshy leaves, or they may have their outer integuments covered with a resinous exudation or thick coating of hairs, each and all of these enabling the plant to resist a continuous absence of rain. Of such plants illustrations are seen in the cacti and euphorbias. Plants growing in moist climates, on the other hand, are characterised by their pliability and the more delicate structure of their epidermis or coverings, there being no need for the storage of water and prevention of too rapid transpiration.

This, then, shows the influence of climate upon the distribution of vegetable life, and though it is the most important, yet it is not the only important condition. There is no doubt that the distribution is much affected by, and indebted to, the carrying power of water, wind, and animal life, about each of which a few words may be said in turn. The effects of marine currents are seen in the occurrence of the coco-nut palm upon the shores of moat, if not all, of the Pacific Isles. The winds are responsible for the conveyance of the minute spores of the cryptogams, and though not to the same extent, those of the phanerogams.

The furs of wild animals are a useful means of carrying seeds for long distances, and migrating birds affect the same purpose, voiding many seeds in an uninjured state. But there is another side to the influences which animals have upon vegetation, and that is, they may destroy plant-life of various types, as when districts are raided by locusts or other insect pests. Man also has taken his share in the extension and extermination of the vegetable world, cultivating the useful varieties of plants, destroying the useless. Some members of the natural orders Leguminosae, Compositae, Filices, and some few others, occur in all regions. Other plants are of very rare occurrence, as for instance, insular plants, where the islands are so far distant from any country that the transportation of their seeds is out of the question. Still, we find similar plants in several districts between which there seems to be no connection. Their origin cannot be traced to any of the influences already mentioned so we have to look for an explanation elsewhere. It is suggested that, as the dry land has been at various times submerged beneath the surface of the sea, communication has been created between different parts of the earth previously isolated, and that plants have by this means been transported from one point to another, and so when "the" elevation of the land has again taken place such plants have continued to thrive in their new localities, and these localities are separated from one another by a seemingly insurmountable distance.

There are eight principal regions of the earth producing distinct types of vegetation. In the equatorial zone we find the most profuse and luxuriant, owing to the combined heat and sufficiency of moisture. The trees are large, with trunks of enormous diameter, the flowers display a varied and pleasing brilliancy of colour, and aerial plants abound, weaving the forests into dense networks of vegetation. Palms, bananas and orchids are on every side, whilst those curious and interesting anomalies—the pitcher plants—here ply their trade for the entrapping of insect life. One curious plant peculiar to this zone is the rattlesn, whose flower has a diameter of 3 feet. The plant is a parasite of fungoid structure and possessing neither stem nor leaves. Rivalling this is the aristolochis or snake root, so called from its supposed value in curing snake-bites. It bears helmet-shaped flowers, in some cases large enough to be worn as caps by the Indian boys in the Brazilian woods. In this zone also find some of the most sterile tracts of land, notably the Sahara desert and a portion of Arabia. These districts owe their lack of vegetation to their waterless condition.
The tropical zones, again, exhibit palms and bananas, but a distinctive character is given to the zones by the prominence of tree ferns and pepper plants.

In the sub-tropical zones palms and bananas are still in evidence, but in decreasing numbers. Arboreal grasses are a noticeable feature; and myrtles, acacias, and heaths flourish. Evergreen shrubs begin to make their appearance in the warmer temperate zones, and oaks, beeches, chestnuts, and pines are abundant. The vine here attains its most perfect development; and such trees as the pomegranates, when bedecked with their brilliantly-coloured blossoms, create a striking feature in the landscape.

Shrubs, such as roses and brambles, are distributed throughout the cooler temperate zones, and these are the homes of the ivy and hop. It is here that the vegetation presents such contrasting appearances in summer and winter—the leaves falling from the trees, and herbs dying down as winter approaches. Conifers are especially characteristic of the sub-arctic zone; rhododendrons, sedges, and lichens of the arctic zone; and herbaceous perennials, such as the saxifrages, of the polar zone, where also the cryptogams predominate, lichens being especially abundant.

As regards the relative distribution of cryptogams and phanerogams, it would appear that the proportion of the latter to the former is much larger near the equator, but as we proceed from the equator to the poles this proportion decreases. The proportion of monocotyledons to dicotyledons increases as we recede from the equator to the poles; and, as a rule, the moister the climate the greater the proportion of monocotyledons.

The history of our vegetation, as well as that of bygone periods, is arrived at by studying the remains and traces of plants which are met with in most stratified rocks which have been produced by successive geological changes of the earth's surface. From the results of such researches we are led to believe that the earliest forms of vegetation consisted entirely of cellular plants, such as mosses and lichens, and that there has been a gradual increase in complexity of structure up to the present time.

The fossil plants of the earliest formations show that the vegetation of that period consisted of algae and other low forms. These were succeeded by cryptogams, ferns, lycopodiums, and equisetums, and these again by gymnospermous plants, such as conifers, with tree ferns and some few monocotyledons. In the later periods angiosperms made their appearance, commencing with incomplete, passing to polypetals, and leading up to gamopetalous plants, which now prevail. Thus there is sufficient evidence to show that there has been a succession of types of vegetation each somewhat more complex in morphological structure than the preceding type, but we are also led to the conclusion that this succession has not been continuous but has been interrupted in different localities.

As regards the distribution in altitude I may say a few words. It has already been stated that the lofty tropical mountains show a varied vegetation, the plants found above the limit of eternal snow being representatives of the species found in regions nearer the poles. The surfaces of these mountains are hence divided into regions corresponding to the tropical, temperate, and frigid zones. Meyen has classified them into regions similar to his divisions of the earth's surface into zones.

His region of palms and bananas corresponds to the equatorial zone, the region of tree ferns to the tropical zone. The elevated East Indian forests in the equatorial zone abound in the genus Ficus, presenting an appearance of gloomy grandeur and dense vegetation. The region of laurels and myrtles corresponds to the sub-tropical zone, and the region of evergreen trees to the warm-temperate zone. Conifers, representing the sub-arctic zone, occur on most mountains, usually as pines and firs. The vegetation in the region of Alpine herbs generally occurs as patches situated on round which lies beneath a mantle of snow during the greater part of the year. Here lichens flourish in abundance, and the plants in general are characterised by their large sized and showy flowers.

The altitude to which the various classes of vegetation attain is also to a great extent determined by local circumstances, as shown by the differences in distribution on mountains in the same one.

A discussion followed, in which the Chairman, Secretary, Messrs. Bastow, Davis, and Brown took part.

A report on materia medica, by Mr. C. J. Taylor, was read by the Secretary in the absence of the author. It embodied notes on the opium trade of Asia Minor, the localisation of nicotine in tobacco, and of fatty and essential oils in plants, the constituents of eucalyptus oils, and the histology of canna bark. The report was followed by a discussion, in which the Chairman, Messrs. Moore, Brown, Bastow, and Walker joined.

The meeting then adjourned.

**Reviews and Notices of Books.**

**THE LONDON CATALOGUE OF BRITISH PLANTS.**

A new edition of the 'London Catalogue' has for some years been hoped for by British botanists. The vexed questions concerning the priority of names that have exercised systematists during the last few years have left an unsettled feeling amongst those who study plants rather than plant names, which will be to a certain extent calmed by the publication of an authoritative list of the names to be used in future for British plants. Mr. Hanbury has availed himself of the critical knowledge possessed by Mr. B. D. Jackson, the compiler of the 'Index Kewensis'; Mr. J. Britten, the editor of the Journal of Botany; Mr. Arthur Bennett; and other well-known botanists.
As regards the critical genera, Hieracium, Rubus, Salix, Epilobium, etc., Mr. Hanbury has obtained the assistance of experts in each. The connection of the names of Mr. Arthur Bennett with the Naiaecae, Massae, Groves with the Characoae, Messae, Linton and Moyle Rogers with the Rubi, and that of the Rev. E. Marshall with the genus Epilobium, will be sufficient to ensure that the work has been as well done as possible in the present state of our knowledge. In consequence of the lamented death of Dr. Buchanan White, of Perth, last year, the list of Salices which he had prepared could not be discussed by the committee that met at Mr. Hanbury’s house to settle all details, and an alternative list has been given in the form of an addendum compiled by the Rev. E. Linton. The latter corresponds with the “Exsiccatae” of Salices that the brothers Linton are issuing. The list differs from that of Dr. Buchanan White chiefly in the parent under which the hybrids are classified. The plan that has been adopted of giving the supposed or proved parents of hybrids is one that gives a better idea of the forms likely to be met with and of the true relationships of the plants, than a mere list of varietal names, and might with advantage have been followed by Mr. Hanbury under the Hieracae. In that genus the plants are divided into thirteen groups, containing 108 species and a large number of varieties, amongst which it can hardly be supposed that there are no hybrids. Mr. Hanbury has, however, grown a number of the plants, and he may perhaps have good reason for regarding them as varieties due to climate, soil, and altitude, rather than hybrids. It is in this genus and the Rubi that the largest additions have been made.

The number of generic names that have been altered are comparatively few. In the case of these, as well as of the more numerous altered specific names, it would have been merciful on the part of the author towards those who are not so familiar as himself with the changes that have taken place, if he had given in parentheses the name of the plant in the last Catalogue. The tyro or amateur who looks in the ordinary portable florfas will be decidedly nonplussed when he endeavours to find a description of such plants as Fribickia umbellata, Koel, or Borella cantabrica, O. Kuntze. There is one other suggestion that may be offered for the improvement of the list, and that is that in another edition the generic numbers should be placed in heavy type in the left-hand blank columns, so as to catch the eye easily. At present the heavy type is kept for the numbers of the families, which are not referred to at all in the index, whilst the generic numbers are small, and in an incompositional position, although they are given in the index and will be used for reference.

The typographical errors are practically nil, but the distribution might possibly bear a further revision. Under Ranunculus (flabellatus, Desf.), C. europaeus Wyman (= R. charophyllus, Linn, of previous catalogues) the distribution is given only as C, and under Simethis bicolor as 1, although the former has been found in Hampshire as well as in Jersey, and the latter in Ireland as well as in Hampshire. Taken as a whole, however, the new list will be a most welcome addition to botanical libraries, and all students of the British flora must feel indebted to Mr. Hanbury and his coadjutors for what is undoubtedly a labour of love.

The author of this book is director of the Chemical Institute of the Faculty of Sciences at Nancy, and it is practically a reprint of his report on the Chicago Exhibition, which dealt with chemical and pharmaceutical products, etc. Readers will realise how chemical industries have been modified during the last quarter of a century, and also follow with interest the author’s comparison and contrast of the outcome of French, German, and English energy. American enterprise is duly acknowledged, and credit given to other countries where due, chemical and pharmaceutical products, colouring matters, essential oils, and perfumery being chiefly dealt with.

Correspondence.

[Letters to the Editor should be written as concisely as possible, on one side of the paper only, and preferably with name and address for publication.]

Rem-stamping Weights.

Sir.—In February last the Inspector of Weights and Measures of this city requested me to send all my weights to his office to be examined, and also serve me with a notice that they must be sent once every year for the same purpose. When they were returned he charged me for re-stamping all the weights and for adjusting those which required it. In reading through the Act it did not appear to sanction the charge for re-stamping, besides which, if the grain weights were to be re-stamped once each year it was evident they would soon become useless, thus increasing the working expenses of business by the charge for re-stamping and the loss of the weights, and therefore the inspector’s attention was called to these points. But as he maintained the charge was correct, I laid the facts before the Board of Trade, and after some correspondence I was informed that the inspector had been instructed by the local authority to repay me the charge for re-stamping (this has since been done), indicating, I presume, that it is not necessary to re-stamp weights, and that all charges made for so doing can be recovered.

Leeds.

Edwin Yewdall.

Election to the Welsh Girls’ School.

Sir,—I wish to inform the readers of your valuable Journal that Mary Margaret Lewis has been successful in being elected to the Welsh School at Aaerford at the recent election. I wish to take this opportunity of thanking all chemists who have kindly supported this little girl, it being a most deserving case; and especially do I wish to thank our President, the late Vice-President (Aalderman W. Gowan Cross), and Mr. Brindge for all their kind and most valuable support and influence; also Alderman W. Vaughan Morgan, Mr. O. V. Morgan, Mr. Grose, of Swanes, Mr. Munday, of Cardiff, and Mr. R. L. Whigham, of Brook Street, who have assisted in every possible manner; and, on behalf of the mother, Mrs. Lewis, I must again express my sincere thanks to all who assisted.

Chelsea, S.W.

Isaac T. Lloyd.
Notes and News.

TESTIMONIAL TO MR. F. W. SHORT.—It is proposed to present Mr. Short with a testimonial on the event of his retirement from his position as demonstrator in the Society's School of Pharmacy, which he has held for the last thirteen years. A committee has been formed for this purpose, and a circular has been sent to all students of the school during the past fourteen years whose addresses could be ascertained. The subscription list will be closed on Wednesday next, the 19th inst., and intending contributors are requested to communicate by that date with Messrs. Eastes and Tickle, the honorary secretaries, 17, Bloomsbury Square, W.C.

PROCEEDINGS OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.—The editor of the Bulletin of Pharmacy, after looking through the last number of this publication, advises all members of the Association to protect their reputations for consistency, good sense, and knowledge of English, by insisting upon the reporter of the discussions being prevented from putting into their mouths "something they never said, never intended to say, and never would say." It is difficult, on this side of the Atlantic, to ascertain how far the implied charge of incompetent reporting is sustained, and the more especially so since it is said to have been decided, presumably from motives of economy, not to send copies of the 'Proceedings' to either foreign or domestic journals of pharmacy. This, if correct, appears but a mean and paunchy way of saving, considering that the Association regularly receives free copies of the journals to which the volumes of 'Proceedings' have been formerly sent in exchange, and has also utilised their contents in the preparation of the abstracts published in the latter. Moreover, no formal notice of the change appears to have been sent out to the journals interested, so that the arrangement savours somewhat of obtaining goods under false pretences.

DISINFECTING A WHOLE WATER SYSTEM.—In Sprottan, Germany, the following method of disinfection was resorted to as a last means during the typhus epidemic in 1894: The whole pipe system was cleaned by means of steam forced through it by a portable boiler. A boiling solution of soda was then pumped through the pipes. For this purpose six tons of soda were thrown into the water reservoir and brought to boiling point by means of steam.

HOUSEHOLD RECIPES.—The Manchester Evening Guardian credits 'the editor of a well-known ladies' paper with telling the following good story at the New Vagabonds' dinner:—One week, casually overlooking the "Answers to Correspondents" column, which was entrusted to a lady journalist, he read the following alarming statement together with the business-like addendum:—"Martha,—The reply given last week was a mistake. You should have used 1/2 grain of strychnine, not 1/2 lb. Joes is the best house for mourning."

SYNTHETICAL DRUGS IN THE NEW PHARMACOPEIA.—The Therapist advocates the inclusion of piperazine as a lithytoic, phenocoll hydrochloride as an anti-pyretic, chloral amide as a hypnotic, and formalin as an antiseptic, in the new British Pharmacopoeia.

PHARMACEUTICAL INSTITUTE AT BERLIN.—The Russische Pharm. Zeitschrift claims to have received reliable information that Professor Dragendorff, late of the University of Dorpat, has received and declined an invitation to occupy a chair in the pharmaceutical institute about to be founded in Berlin. The reason for this decision is said to be the fact that the professor would not, for the present at least, be provided with a separate laboratory and lecture-theatre.

NATURAL HISTORY OF PLANTS.—The publication of Kerner and Oliver's attractive work is now being continued by Messrs. Blackie and Son, who have just sent out part 13. The conclusion of the section on alteration of form in plants, produced by gall-producing insects, is followed by a highly interesting dissertation on the genesis of new forms as a result of crossing, the production and characters of hybrids being fully dealt with. The fascinating problem of the origin of species then presents itself for consideration, and information regarding the genesis of new species and the derivation of existing ones serves as an introduction to the study of various systems of classification. The scheme of classification adopted for the purpose of the work is based on the division of the vegetable kingdom into four main divisions, and in the present part the Myxothallophyta and four of the five classes of the Thallophyta receive attention.

'SCIENCE PROGRESS.'—Professor Marshall Ward contributes the first article in Science Progress for June, his subject being the time-worn one of the fixation of free nitrogen by plants. The ratio of the specific heats of gases is discussed by J. W. Capstook, and J. E. S. Moore writes on the protoplastid body and the metaplastid cell, whilst J. W. Rodger concludes his article on progress in physical chemistry during 1894.

COCA WINE OR VIN MARIANI.—The Lyons Pharmaceutical Society has protested against the action of General Duchesne in ordering Vin Mariani for the use of the French soldiers proceeding to Madagascar. It is pointed out that any pharmacis is capable of preparing a coca wine as good as that of M. Mariani, and that, since the general has not found it necessary to specify any particular brands of Bordeaux or Champagne wine for the troops, it is equally undesirable that he should give one maker a monopoly of the supply of coca wine.

HELIOV AND ARGON.—Dr. Brauner (Chem. News) considers that the fact of the absorption of helium by aluminium seems to prove its metallic character and confirm the supposition that it is related to hydrogen in the same way that argon is related to nitrogen.
ENLARGEMENT OF THE 'PRACTITIONER.'—In concluding the first volume of the Practitioner published under his editorship, Mr. Malcolm Morris speaks of the increasing favour with which the paper has been received, and announces its enlargement by eight pages, which will be devoted to periodical reviews of the progress made in every department of medicine and surgery.

PROPOSED INSTITUTIO OF PHOTOGRAPHY.—Referring to the projected municipal institute of photography in London, Photography expresses the hope that the establishment may be a good one, under the presidency of a man possessing a good technical education and also a really practical knowledge of all the processes of photography. Neither "a young man, red-hot from one of the universities, who has to pick up his practical knowledge from his own workmen," nor "an expert workman with no training in the sciences, the arts, in philosophy, and in other forms of culture" will do for the position; nor should there be a revival of the system which involves "the formation of an organisation to obtain a high salary for a young man寅fluentially connected, but ostensibly for the public promotion of some form of culture."

ROYAL SOCIETY CONVERSAZIONE.—At the conversations at Burlington House, on Wednesday night, there were some forty scientific exhibits, but there was little shown that was strikingly novel from a scientific point of view. Colour-photography, infection by flies, detection by fingerprint, and photography of spectra of gases, were perhaps most prominent amongst the subjects illustrated, but a greater attraction was the telephone apparatus by means of which visitors were put in direct communication with Edinburgh and Dublin by means of the new trunk lines.

English News.

MERCHANDISE MARKS ACT.—Thomas Manley, of 11, Queen's Arms Court, Blackfriars, was summoned at the Mansion House on June 7 for an alleged infringement of the Merchandise Marks Act in having sold May 30 certain sarsaparilla and sulphur tablets to which goods a false trade description was applied; defendant having been seen in Fleet Street with a barrow, attached to which was a large board upon which was written in conspicuous letters, "Holy's Sarsaparilla and Sulphur Tablets," and upon the barrow were a number of small boxes bearing labels. The tablets were alleged to be of a very inferior kind, and the sale of them calculated to do Messrs. Hood and Co., of Snow Hill and Massachusetts, very considerable injury in their business. The firm had recently obtained a conviction against another person for selling tablets, with a similar false trade description, in Bristol. It was held that the defendant had infringed the Act, and a fine of 20s., with costs, was imposed.

ROYAL BOTANIC SOCIETY.—At the gardens of the Royal Botanic Society, on Friday, June 7, Dr. D. Morris delivered the first of two lectures upon the "Romance of Plant Life," with illuminating illustrations. Some of the most striking features of the vegetation of the Canary Islands were described, chief amongst these being the singular dragon trees, which are regarded as the survivals of a very old African flora. It has been suggested by Balfour and others that, as the ice in the Great Ice-age gradually receded northward and the climate got warmer, these plants were driven to higher regions; and hence on the high peaks of Central and South Africa, the slopes of Ruwenzori, and the mountains of Abyssinia, the remains were found at the present day of an old African flora which, by climatic changes, had been gradually driven out and replaced by more tropical plants. The study of these and similar plants afforded one of the most interesting problems in botanical science.

FOOD AND DRUGS ACT.—James Pollard, of Pensilver, St. Ive, was summoned at Callington on June 6, for selling saffron adulterated with 2% per cent. of grit and vegetable matter. Mr. J. H. Trebane, of Plymouth, for the defence, objected that the certificate of the analyst was incorrect, in that it omitted to state the component parts of the article received by him for analysis. The Bench upheld the contentions and dismissed the case.

ROYAL INSTITUTION.—A General Monthly Meeting of the Members of the Royal Institution was held on the 10th inst., Sir James Crichton-Browne presiding. The following were elected members:—Mr. Benjamin Bennett, Mrs. Henry Burton Buckley, and Mr. William Watson Cheyne, F.R.S. The special thanks of the members were returned to the Right Hon. Lord Playfair for his donation to the fund for the promotion of experimental research at low temperatures.

PLYMOUTH, DEVONPORT, STONEHOUSE, AND DISTRICT CHEMISTS' ASSOCIATION.—At the monthly committee meeting of this Association, held on the 11th inst., the Secretary read Dr. Dunn's report of the chemistry examination, held at the Technical Schools on the 25th ult.: 1st, Mr. Fairweather; 2nd, Mr. Hearde; 3rd, Mr. Sleep. He also drew notice at the exceptional character of Mr. Fairweather's work. It was afterwards decided to have an outing, of which due notice will be given shortly.

Scotch News.

EDINBURGH CHEMISTS', ASSISTANTS' AND APPRENTICES' ASSOCIATION.—The first botanical excursion of the season took place on Wednesday, June 5, when forty-five members assembled at Blackford Hill at 8.30 p.m. The weather was fine and clear and a very successful excursion took place, the company walking over the Blackford Hill and along the banks of the Brae Burn, returning to town by Liberton. Among the plants collected was a fine specimen of the comparatively rare Lychnis viscosa. The party was conducted by Mr. J. Rutherfurd Hill.

REMOVING THE LAND MARKS.—The taking down and rebuilding of the North Bridge, Edinburgh, and the erection of the new buildings for the Waverley Station of the North British Railway Company, will involve the entire removal of the historic house, 52, North Bridge, in which the now extensive business of Duncan, Flockhart and Co. was begun in the early years of the present century. The business at present conducted there is to be removed in July to temporary premises at the head of Waverley Steps, 9, Princes Street. When the alterations are completed, business will be resumed in new premises on the old familiar site at 52, North Bridge.
Irish News.

PHARMACEUTICAL SOCIETY OF IRELAND.—On Wednesday, the 5th instant, the monthly meeting of the Council was held at the Society’s House, 67, Lower Mount Street, Dublin, at three o’clock.

The Rev. Willis Bayes was in the chair, and the other members of the Council present were the Vice-president, Mr. Beggs, and Messrs. Murray, Lyons (Belfast), Ryan, Bernard, and Conyngham.

The President stated that he had received a letter from Mr. Hodgson, who had been honorary treasurer of the Society since its establishment in 1876, resigning that office and also his seat on the Council. Mr. Hodgson’s letter stated that as the Society had now a well-furnished house of its own, a well-equipped school, and nearly £1000 invested, he felt that he could do his work.

The Vice-president said the resignation of Mr. Hodgson would be an irreparable loss to the Society, and moved that he be requested to reconsider his resignation.

Mr. Murray seconded the motion, which was unanimously carried.

The President, in putting the motion, spoke strongly of the services Mr. Hodgson had rendered to the Society.

The President said they had all doubtless heard that one of their most active members (Mr. Wells) had sustained a severe injury to one of his eyes through the bursting of a soda-water cylinder.

On the motion of the Vice-president, seconded by Mr. Murray, the Registrar was directed to write to Mr. Wells conveying the deep regret of the Council at the accident which had befallen him.

A letter was read from Mr. Brembridge, Secretary to the Pharmaceutical Society of Great Britain, stating that the request of the Pharmaceutical Society of Ireland that their Preliminary examination should be accepted by the Pharmaceutical Society of England in lieu of the first examination had been referred to the Board of Examiners of the latter Society.

Letters were received from the Local Government Board of Ireland on the subject of a practice existing in certain Poor Law Boards in Ireland of giving contracts for the supply of medicines to grocers. The Local Government Board asked in what unions the practice prevailed, and having been informed, replied that it had already communicated with the guardians on the subject.

A letter was received from Mr. J. M. Whelan, solicitor of Roscommon, who was acting for the Society in prosecutions against two residents of the town for selling poison in sieve dip without being qualified to do so. One of the defendants, Mr. Daniel Walsh, sent a letter of apology, stating that he was not aware that he had been violating the law, and that he had sent back three-fourths of a dozen packages he had ordered.

The Council decided to instruct Mr. Whelan that, on Mr. Walsh apologising in court and paying his proportion of the costs, the summons against him should be withdrawn.

It was ordered that Mr. Alexander Robertson, chemist, of Oban, should be informed, in reply to a letter of his, that the Pharmacy Act (Ireland) applied to patent medicines, but that his question regarding the 1st class, whether or not it covered the 2nd class, was left an open question; and, in reply to his second query, no person save those registered under the Irish Acts could sell in Ireland any scheduled poison.

A letter from the District Inspector of the Royal Irish Constabulary at Ballymoney called attention to a case which occurred there of a child who was poisoned by laudanum sold without a label.

A letter from Mr. James C. McWalter, of Earl Street, Dublin, apprised the Council that in reply to a question put in Parliament by Mr. T. M. Healy, M.P., to the President of the Local Government Board of England, an intimation had been given that, pending a formal reply to be given when Parliament meets, an order would be issued placing members of the Irish Pharmaceutical Society under the provisions of the Pharmaceutical Society of Great Britain as regards positions as public dispensers in England.

The President said they were very much obliged to Mr. McWalter for the trouble he had taken in the matter.

Other business having been disposed of, the Council adjourned.

PHARMACEUTICAL PROSECUTION.—In the Southern Divisional Police Court, Dublin, on June 6, before Mr. Swifte, Mrs. Margaret Fannin and Mr. Richard Booth, trading as Messrs. Fannin and Co., surgical instrument makers and druggists, Grafton Street, were summoned at the instigation of the Irish Pharmaceutical Society of Ireland for having on February 12 sold to George A. Phillips a quantity of corrosive sublimate, a poison, contrary to the provisions of the 28th chapter of the 33rd and 34th Victoria, they not being registered as pharmaceutical chemists under the Act.—Mr. R. K. Clay, solicitor (Casey and Clay), appeared for the defendants, and said he admitted the facts as alleged in the summons. He said the house of Fannin and Co. was within the spirit if not within the letter of the Act. Previous to 1876, and down to 1886, Mr. Fannin carried on business in Grafton Street precisely as it was being carried on at present. At his death he appointed a Mr. Booth and his widow trustees, and directed them to carry on the business until the younger of his two sons came of age, when it should be handed over unconditionally to these two sons. During Mr. Fannin’s lifetime and up to the present, a fully qualified surgeon and physician, Dr. Whittaker, acted as manager of the business, with a share of the profits. The Act of 1876 had a proviso preserving the rights of existing chemists and druggists, the only restriction being as to compounding the poisons or medicines, and there was a provision enabling trustees, as in the present case, to continue such business so long as such business was conducted bona fide by a duly qualified assistant—a duly qualified assistant within the meaning of the Act being a pharmaceutical chemist, or druggist, registered as such under the Act. So far as the protection and safety of the public were concerned, they could not be better safeguarded than they were by the manner in which the business of Messrs. Fannin and Co. was carried on.—Mr. Clay, for the complainants, contended that no one in the establishment was qualified under the Act to sell poisons, and therefore an offence had been committed.—Mr. Swifte reserved judgment.

Welsh News.

PRESCRIBING BY A CHEMIST.—On Friday, June 7, the Cardiff coroner opened an inquest on the body of Arthur, the three-year-old son of Frederick Wm. Biggs, of 21, Calma Street, Cardiff. The evidence of the mother showed that the child had sickened on Monday the 5th, had an attack of croup on Tuesday, and began coughing symptoms of measles. He was kept indoors, but it was not until Wednesday evening, the 5th inst., that seeing the child’s condition was becoming more serious, the father of deceased went to a neighbouring chemist, named Clark, of Coburn Street, and was supplied with a bottle of medicine and some powder. These were administered according to the chemist’s directions,
but at half-past four o'clock on the following morning the child died. The doctor called in subsequently would not certify as to the cause of death. The jury failed to agree upon a verdict, and the coroner adjourned the inquest until Saturday, June 6, so that Mr. Clark, the chemist, might be called.—Dr. M'Cormick then stated that he had made a post-mortem examination of the deceased's body, and found that death was due to acute bronchitis. If medical aid had been obtained some days before death the child, who was exceedingly robust and well-nourished, would have undoubtedly survived; but the chemist’s physio had produced no harmful effect.—The coroner then pointed out to the chemist that he might have been in a very disagreeable position if Dr. M'Cormick had testified that the child’s life could have been saved if medical aid had been called in on the previous night. In fact, the jury might then have been of opinion that he was guilty of manslaughter. By his action he had prevented the father from calling the doctor the night before the child died. He was, therefore, exceedingly to blame, as, for the sake of selling his medicine, he had prevented the parents from calling in the doctor.—The jury returned a verdict of “Death from natural causes,” and expressed the opinion that the parents of deceased were to blame for not having called in the doctor earlier, and also severely blamed the chemist for prescribing under such conditions.

ABERDEEN AS AN ANCIENT HEALTH RESORT.—The South Wales Daily News observes that doctors and druggists were unknown at Aberdeen in the year 1783, and yet the whole valley had been for a year and a day without a single death having taken place. The first to die the following year was an uncommonly tall man, nicknamed “Shoni Paw,” but it was insinuated that he had dealings with a distant relative, who was an apothecary.

Miscellaneous News.

KENTUCKY PHARMACEUTICAL ASSOCIATION.—The sixteenth annual meeting of the Kentucky Pharmaceutical Association was held at the Mammoth Cave, May 21 to 24. Seventy-five members were in attendance, accompanied by a large number of ladies, making a party of about one hundred and fifty. Twenty-five new members were elected. Dr. H. M. Whippley, of St. Louis, was present, and was elected a honorary member. A strong resolution endorsing the legislation proposed by the American Pharmaceutical Association, looking to the higher recognition of the pharmacist in our Army and Navy, was offered by Mr. C. Lewis Diah, and unanimously adopted. The time for holding the annual meetings was changed to the third Tuesday of June, and it was decided that hereafter the meetings be held at places remote from cities and towns, as best favouring the social and professional intimacy of the members attending. The next meeting will be held either at Grayson or Estill Springs, at the discretion of the Executive Committee. Mr. C. J. Rosenham, of Louisville, was awarded the annual prize of $1000 for the best commercial paper—“The Passing of the Apothecary Shop”; Prof. O. C. Dilly won the prize for the best scientific paper—“Alkaloidal Assay.” A resolution increasing the annual fee from one to two dollars was tabled. The resolutions adopted at the last meeting of the American Pharmaceutical Association with reference to the requirement of certain qualifications of apothecaries were adopted as a whole. The following officers were elected for ensuing year:—President, Addison Dismitt, 6th and Walnut Streets, Louisville; Secretary, J. W. Gayle, Frankfort; Treasurer, Charles G. Morris, 28th and Dumas Street, Louisville; Chairman, Executive Committee, O. C. Dilly, 2101, W. Walnut Street, Louisville.

CHARACTERISTICS OF GASES.—The Electrical Review reproduces the following figures from the two wall diagrams used by Lord Rayleigh for the purpose of illustration in his recent Friday evening lecture before the Royal Institution, the density of nitrogen under different conditions being represented, whilst the characteristics of gases are given in the accompanying table.

NITROGEN, DENSITY.

<table>

* Colourless.
† Bluish.
Poisoning Cases and Inquests.

**Carbolic Acid.**—Effie Wilson, aged 38, died on Tuesday, May 21, at Victoria Terrace, Skirbeck, from the effects of carbolic acid, self-administered. Verdict: “Suicide while of unsound mind.”

**Morphine.**—Martha Esther Enderwick, aged 76, died on Sunday, May 26, at Brighton House, East Dulwich, from the effects of morphine. Verdict: “The cause of death was coma, consequent on a dose of morphine.”

**Prussic Acid.**—Walter Sellers West, aged 29, died on Wednesday, May 29, at 247, Hagley Road, Birmingham, from the effects of prussic acid, self-administered. Verdict: “Suicide while of unsound mind.”

**Opium.**—Edward Kippa, aged 62, died on Thursday, May 30, in North-West London Hospital, from the effects of opium self-administered. Verdict: “Suicide while of unsound mind.”

**Carbolic Acid.**—William Mather, of the firm of W. Mather and Co., Limited, Manchester, died on Tuesday morning last from the effects of carbolic acid, self-administered. Verdict: “Suicide by taking poison while mentally unhinged through intemperance.”

**Prussic Acid.**—Reginald Conrad Fraser, aged 32, a medical practitioner, died on Monday, June 3, at 105, St. Leonard’s Road, Bromley-by-Bow, from the effects of prussic acid, self-administered. Verdict: “Suicide by taking poison while mentally unhinged through intemperance.”

**Carbolic Acid.**—Tom Littlewood, aged 25, died on Monday, June 3, at Oldham, from the effects of carbolic acid, self-administered. At the inquest held on June 4, the coroner, Dr. G. Thomson, said he thought carbolic acid ought to be put in the schedule, and the sooner it was the better. It seemed to him that of recent years poisoning—either suicidal or accidental—had been getting pretty frequent, and it was quite obvious that there should be some restrictions upon its sale, as was the case with many other poisonous articles. Verdict: “Suicide during a fit of temporary insanity,” and the jury added as an expression of opinion “that carbolic acid ought to be scheduled along with other poisons, and ought to be restricted as to sale.” The coroner said he should forward their expression of opinion to the Home Secretary.

**Benzol.**—Arthur Gordon Williams, aged 2, died on Wednesday, June 5, at 36, Honeywell Road, Wandsworth Common, from the effects of swallowing benzol. At the inquest the coroner suggested that bottles in which benzol was sold should be labelled “Poison.” The jury agreed with the suggestion. Verdict: “Accidental poisoning.”

**Loudamum.**—George Bayliss, aged 49, died on Thursday, May 30, at Birmingham, from the effects of laudanum, self-administered. Verdict: “Committed suicide while of unsound mind.”

**Spirit of Ammonia.**—George Webb, aged 70, died on Friday, June 7, at Plumstead, from the effects of spirit of ammonia taken in mistake for his medicine. Verdict: “Accidental Poisoning.”

---

Patent Office Business.

**APPLICATION FOR PATENT ABANDONED.**
No. 12,198.—June, 1894.—Greer—Medicinal compound for cure of gonorrhoea.

**APPLICATIONS FOR PATENTS.**

[From the Illustrated Official Journal (Patents),]
No. 9867.—Improvements in surgical syringes. May 19.
No. 9923.—Improvements in apparatus for mixing and (or) delivering liquids in measured quantities. May 20.
No. 9934.—Improvements in apparatus or appliances for washing or rinsing bottles and other similar vessels. May 20.
No. 10,069.—Improvements in apparatus for aspirating liquids. May 21.
No. 10,091.—A mixture or ointment for external and internal application. May 22.
No. 10,098.—An improved dish or tray for the development of photographic films. May 22.
No. 10,121.—Improvements in apparatus for use in opening or closing screw-stoppered bottles. May 22.
No. 10,161.—Improvements in machines for perforating or slitting medical plasters. May 22.

**PATENTS PUBLISHED MAY 25.**

**Hot-water bottle (Gray, C. H.).**—The ordinary indiarubber hot-water bottle is fitted with an air-vent by which air may escape while water is poured in, without causing splashing of the water. The vent may be formed by a tube having an independent screw cap, or may be so formed as to be closed by the cap which closes the mouth of the bottle. No. 8817 of 1894.

**Alkaline cyanides (Imray, O., communicated by Goerlich and Wichmann).**—The cyanide of potassium or sodium is prepared by heating a mixture of the powdered brittle alloy of lead and potassium or sodium, which is now made commercially, with dried potassium or sodium ferro-cyanide. The action results in a mixture of lead, iron and the fused cyanide, which is removed by lixiviation. A cyanide containing both potassium and sodium may be similarly prepared. No. 9889 of 1894.

**Oxalates, Making and Purifying (Crowther, H. W., Rosseter, E. C. and Albright, G. S.).**—For preparing alkaline cyanides the inventors fuse the corresponding ferro-cyanide with metallic zinc, whereby a mixture of metallic iron and the cyanides of zinc and of the alkali-metal, is produced. The resultant mass is treated with sufficient carbonate or sulphide of the alkali to precipitate the whole of the zinc, and after fusion and cooling it is lixiviated to remove the pure alkaline cyanide. For purifying alkaline cyanides containing sulphides, they are fused with cyanide of zinc or with the double cyanide of zinc and potassium or sodium. The sulphur is thus removed as sulphide of zinc which is left on dissolving out the purified alkaline cyanide with water. No. 9275 of 1894.

**Thermometer cases (Jones, E., Dearing, and Page).**—The case is formed with a rounded and wedge-shaped top, having a handle formed by two bent wires, which constitute a spring clip. The hinged cover of the case may be arranged to be kept closed by the handle. The case is intended especially for thermometers used in breweries and manufactory. No. 9594 of 1894.

**Sterilising Milk (Hawkesley, T. B.).**—For preparing milk for infants and invalids, the inventor employs a vessel fitted with a thermometer and suited for use with an ordinary fire. This vessel is charged with water, and a closed bottle containing the milk is placed within it upon a perforated plate a short
distance above the bottom of the vessel. After heating for a stated time to a temperature not exceeding 185° F., the treatment is finished. As the lower stratum of milk thus treated is said to be of less nutritive value than the upper, this is provided for by withdrawing it. No. 9766 of 1894.

Artificial musk (A. C. D., communicated from the Fabriques des Produits Chimiques de Thann et Moul- house).—Refers to improvements in patents No. 4963 of 1892, and 15,667 of 1890, and relates to the production of tri-nitro derivatives of hydridene and corresponding compounds. Among hydradenes, those graphite formulae are represented with closed lateral chains. These bodies have a musk-like odour. The inventors prefer to prepare the butyl, propyl or amyl-hydirden by the method of Friedel and Craft, or by other means; to convert this into the di-nitro derivative, and after purifying the latter, to convert it into the tri-nitro compound. The method of preparation is described, but is too lengthy for abstraction. No. 12,980 of 1894.

Soluble double phosphates (Raspe, C.).—Soluble double phosphates of the alkali metals with tin, copper, zinc, antimony, bismuth, etc., are prepared by fusing together stated proportions of the alkaline phosphates, phosphoric anhydride and the oxide of tin or other of the above metals together. This specification describes the quantities and methods of treatment to be used for preparing each compound for use in medicine, dyeing, electro-metallurgy, etc. No. 13,199 of 1894.

Tooth brush (The Will and Flack Co. and Fredericks, M.).—Relates to a tooth-brush having a slot in the handle in which fits a bended or other blade for scraping or cleaning the tongue. No. 13,341 of 1894.

Alcohol (Zdarov, R.).—Comprises the production of alcohol by first converting cellulose, lignin or wood-starch, etc., into sugar and then fermenting it. The conversion into sugar may be effected by inversion with stated proportions of sulphuric and nitric acids under pressure and in a stated manner. A small quantity of calcium superphosphate is preferably added. After fermentation with yeast or the "ferments of vegetable juices," the alcohol is distilled off as usual. No. 13,492 of 1894.

Combs (Hinde, W. B.).—The ends of the metallic teeth of combs are formed with a small spherical enlargement, which prevents injury to the skin, but does not interfere with passage through the hair. No. 2360 of 1894.

Lotion (Raymond, R.).—A lotion for the treatment of eczema, scrofula, blotches, and other skin diseases, is prepared by mixing in a stated manner, and in stated proportions, bismuth carbonate, zinc oxide, glycerin, hydrophytic acid and water. No. 4372 of 1894.

Presorbing fats and oils (Fribert, J. H.).—The oils or fats are contained within a vessel provided with a hot water jacket, and while heated, are subjected to the action of an air blast which eliminates and carries away the ill-smelling gases in the oil or fat. Arrangements of paddle agitators and scrapers for promoting the action are described. No. 6197 of 1895.

Powder for the skin (Hughes, G., communicated from Vittalis, S. M.).—A powder for application to the feet and other parts to relieve soreness from perspiration, etc., is composed of stated portions of calcined alum, potassium permanganate, and henna. No. 5923 of 1895.

Wax for dentists (Mann, W. B., and Stillwell, W. T.).—Relates to an arm-chair for dental use readily adjustable by the operator. The chair is fixed upon a cylinder provided with arrangements by which the chair may be raised or lowered by means of a liquid column controlled by a pump operated by a treadle. No. 6730 of 1895.

Trade Marks Applied For.

[From the Trade Marks Journal.]

Formule for Beverages.*

The following collection of formula for soda-water syrups and other preparations for use at the fountain has been compiled from basic numbers of the "Report" and from current literature:

Ammosia Syrup.

Raspberry syrup
Vanilla syrup
Hock wine

Amyoos.

Shaved ice
Raspberry juice
Orange juice
Juice of half an orange

Shake well, add soda-water, and before serving add a small thin slice of orange or pineapple. Serve with two straws in 14-ounce tumblers.

**Commercial Notes.**

**Musk.**

BY P. L. SIMMONDS, F.I.S.

The odour of musk is very widely diffused in Nature, both in the vegetable and animal kingdoms. Of the former may be instanced the common musk plant (*Mimulus moschatus*, Doug.) and the seeds of *Abelmoschus moschatus*, Medl., *Hibiscus moschatus*, Linn., which are employed by the French under the name of ambrette as a substitute for animal musk. In the animal kingdom there are several pervaded with the musky odour among insects, quadrupeds and reptiles; but for commercial purposes musk is solely obtained from the male of the musk deer (*Moschus moschiferus*).

Unfortunately, we are only able to trace the extent of the trade through the Indian and Chinese trade returns; for nearly a quarter of a century musk has been obliterated from our official imports. All we know is that in 1868 our imports were 10,957 ounces, valued at £11,753; and in 1868 19,753 ounces, of the value of £27,706. The following years, of which we have official records, were:

<table>
<thead>
<tr>
<th>Year</th>
<th>Quantity (ounces)</th>
<th>Value (£)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1869</td>
<td>23,477</td>
<td>23,571</td>
</tr>
<tr>
<td>1870</td>
<td>21,456</td>
<td>24,555</td>
</tr>
</tbody>
</table>

This strong perfume is in demand all over the world. The Chinese have known it for many ages; bordering as their empire does on Tibet and Siberia. They call it che-kiang, "che" being the name of the animal, and "kiang" meaning perfume.

The musk-deer lives in Tibet, Yunnan, Ssa-tso-chuan, and more sparingly in Paleschilii, or Chilbi, N. China. Manchouria also furnishes it. The principal depot of the musk trade is the city of Tachien-lu in about 30° N. lat., west of the province of Ssa-owhan. Tibet and Annam are the principal musk-producing districts. Silungchon, in Kwangal, and Wutongchon, in Yunnan, are probably the chief markets for the musk shipped from Canton.

Mr. R. Lydikker contributed a paper to the *Journal of the Royal Asiatic Society* of Bengal, in 1880, stating that the musk deer there was of common occurrence, and probably extended north of that district in most of the countries to the north of Tibet, and across or round the Gobi desert into Siberia. There are two commercial kinds of musk, the Tonquin or Thibet received chiefly from China, and the Cabardine or Siberian from India. As the interior or Indian consumption is not taken into account, probably 20,000 deer are actually killed, male and female. In some adult males the poul will contain over 2 ounces, but an ounce may be taken as the usual average. Many of the deer killed when young will only average, all round, half an ounce. In most of the hill States of India, the musk deer is considered a royal property, and the Rajahs keep men purposely to hunt it. The Tonquin musk has been as high as 119s. an ounce, and as low as 45s. It now ranges from 90s. to 98s. the ounce.

The best, as we have seen, is the Tonquin pod; the next in quality is collected in Assam. The value of the imports by land from Tibet into India has been in the last five financial years (taking the rupees at the nominal value of 2s.) as follows:

<table>
<thead>
<tr>

**New Remedies.**

[The notes given under this heading, for the information of dispensers, embody recent suggestions in therapeutics, and cover new drugs and improvements in old ones under new aspects. The word "parts" is used to represent parts by weight, both for solids and liquids.]

**Borax, or the Toxic Effect of Borax.**—Féré, after trying borax in西班牙 for six years, finds it far inferior to bromide of potassium, and far more toxic. Growers also has noticed diarrhoea nausea and skin affections following its use. In France the unfavourable opinion of the sale of borax has been strengthened, the effect on the skin being widely confirmed (Therap. Gazette [2], xi. 261, after Jem. Méd.)

In the widespread use of boric acid and its salts in this country as food preservatives this note is suggestive.

**Sodium Sulphocarbacate in Pruritus.**—Local application of the following ointment allays itching in pruritus:—Sodium sulphocarbacate, 5 to 10 parts; vaselin and lanolin, of each 45 parts (Rev. de Thérap.);

**Application of Coal Tar in Eczema.**—Leskow applies a solution of coal tar in essence, prorilase, and prurigo, made thus: Coal tar, 3 parts; alcohol, 95 per cent. by vol., 2 parts; ether, 1 part (Therap. Monats., April, 1895).

**Treatment of Itch.**—Bourguignon’s application for use after thorough cleansing of the skin by bathing consists of oils of lavender, peppermint, cinnamon, and cassia, of each 3 parts; gum tragacanth, 10 parts; potass. carbonate, 70 parts; flowers of sulphur, 200 parts; glycerin, 400 parts. Where the skin is irritated, as in eczema, etc., or when particularly irritable, as in the case of the very young or in the aged, non-irritant ointments, such as the following, should be used:—Ointment of tarax, 20 parts; olive oil, 10 to 30 parts; balsam of Peru, 1 to 3 parts. Or else beta-naphthol, 5 to 15 parts; ether, sufficient to dissolve; menthol, 1 part; vaselin, 100 parts; oil, lastly, lard, 100 parts; soft soap, 50 parts; naphthol, 10 parts; powdered prepared chalk, 15 parts (Rev. Interm. de Méd. et de Chir., 1896, p. 163).

**Asaprol in Infantile Diseases.**—Dr. Mondcorvo after an extended trial of asaprol in various affections of childhood, arrives at the conclusion that it is a very useful and successful remedy. Administered to healthy children in various doses asaprol is without influence on the temperature, respiration, or digestion. In acute infectious cases, however, it lowers the temperature and pulse-rate, and generally increases the urinary secretion. It also exerts an analgesic effect and besides being antipyretic and antiasthenic, it may also be used locally as a hemostatic administered to children ranging in age from ten days to twelve years, in doses of from 25 centigrammes to 3 grammes per diem; it provokes neither headache, tinnitus, giddiness, nor sickness. The taste at first slightly bitter, then passing to sweet, renders it easy of exhibition to young subjects (Bull. Gen. de Thérap., cxviii, p. 368).

**Fluoride of Sodium in Tuberculosis.**—Bourgeois states that by administering fluoride of sodium in doses commencing with 1/2 milligramme to 5 milligrammes a day, he has effected a cure in many cases of well-established tuberculosis. The dose cited is small, for as much as 1/2 to 2 grammes may be given daily (Bull. Gen. de Thérap., cxviii, 373).
PHARMACEUTICAL JOURNAL.

Notes and Queries.

[The information given in this column includes both notes of practical interest to pharmacists, and replies to queries which seem to possess sufficient interest to readers generally.]

REDUCED IRON.

[884.] This preparation, according to G. Fleury (//Bull. de pharm. de Bordeaux//), should be carefully examined by pharmacists, since he finds that the commercial article is rarely of good quality. A specimen recently examined by him contained only traces of metallic iron; the rest being ferrous-ferric oxide, and silica. When macerated with fifteen times its weight of 1 per cent. hydrochloric acid, only 0.05 per cent was dissolved.

SANDAL WOOD OIL.

[885.] This oil is commonly adulterated with cedar wood oil, but Pears and Moor find that sandal wood oil capsules sometimes contain cedar oil and an unsaponifiable oil not yet identified. A paper on the subject was recently read before the Society of Public Analysts, and will, presumably, be published in full in the Analyst.

PRESEVATION OF POWDERED ERGOT.

[886.] Ergot may be preserved indefinitely in the state of powder, according to Bertini (//Boll. Chim. Farm.//), by first coarsely powdering, then macerating for eight days with three times its weight of petroleum ether and shaking frequently, and finally drying and reducing to fine powder. The ether is said not to dissolve, any of the active principles of the ergot, but removes all the fatty matter. The Moniteur de la Pharmacie, however, remarks that the process is not new, and expresses doubt as to its effectiveness and the correctness of the statements made regarding it.

EXTEMPORANEOUS STERILIZATION OF COTTON-WOOL.

[887.] Lermayer and Helm (//Presse Médicale//) sterilise absorbent cotton-wool extemporaneously by soaking it in a saturated alcoholic solution of boric acid, and then igniting. The cotton is said to be sterilised by the heat, whilst the acid prevents carbonisation. Five seconds suffices, and as soon as the flame assumes a bright green colour it is extinguished. The wool remains white and dry, and it is stated that culture experiments have proved the completeness of the sterilisation.

HYDROPERMIC INJECTIONS OF QUININE.

[888.] The best salt for these injections, according to Kelsch (//Arch. de méd. et de pharm. militaire//), is the basic hydrochlorate of quinine. This is rendered more soluble by the addition of analgesines, the solution being prepared by dissolving quinine hydrochlorate, 3 Gm., and analgesine, 2 Gm., in distilled water, 6 Gm., and thus containing 50 per cent. of the quinine salt. The solution should be freshly prepared.

CAUSE OF CINNAMON.

[889.] The formula of Belersdorf, of Hamburg, for this aliment is as follows (//Ann. de Pharm.//)—Dried cassia, 14.0 Gm.; caustic alkali (containing 4 per cent. potash and 1 per cent. soda), 0.48 Gm.; glycerin, 7.0 Gm.; yellow vaselin, 21.0 Gm.; zinc oxide, 0.5 Gm.; carbol, 18.0 Gm.; water, q.t., to make 1000 Gm. This aliment is stable and homogeneous, and serves as the vehicle for any medicament. When spread upon the skin it thickens and dries rapidly, forming an adherent pellicle.

SODA-WATER FOR BURNS.

[890.] Numerous remedies for trifling burns have been suggested, e. g., alizarin and one proposed by Gowalowisky (//Ph. Centrall//), who recommends a stream of soda-water from an ordinary syphon to be projected on to the burnt surface.

To Avoid Iodism.—Hardaway claims that the continued use of the following mixture does not produce iodism:—Potassium iodide, 1/2 to 1 ounce; ammonium citrate of iron, 2 drachms; tinct. liquam., 2 drachms; water, 1/2 liquid ounce; compound tinct. dinitro, 2 fluid ounces. One teaspoonful in water after meals (Med. Week).

HYDROPERMIC INJECTION OF COFFEE.—Coffee is best given hydropermiscally; it is painless and produces no cutaneous eruption. The following is a convenient form:—For 1 fluid ounce, containing the alkaloid Coffee, 2 parts; benzene of sodium, 6 parts; distilled water, 8 parts. Every gramme of this solution contains 25 centigrammes of caffeine (//Amer. Medico—Surgical Bull.//, 1895, No. 8, p. 469).

QUININE AND IPPECUM IN DYSENTERY.—The following combination has been used in the Mandalay Regiment at Bhurtpore in many cases of acute dysentery. It is said never to fail.—Sulphate of quinine, 2 grains; powdered ippecu, 5 grains; ammon. chloride, 10 grains; tinct. opium, 12 grains; water, to 1 ounce. To be given every four hours (Practitioner, May, 1896).

VARIATION OF AMYL IN HEPATIC COLIC.—According to Blanc, amyli-valerianate is capable of dissolving choleretic, and is suggested as a remedy in obstruction of the gall duct by cholesterine calculus. In general, the preparation acts like ether, in cases of gall-stone colic it produces a sedative and stimulating effect on the liver, as it not only ameliorates the attack but prevents a recurrence of the disease. Irritable stomachs should first be treated with a few drops of sulphuric ether, then to the gelatin capsules (containing 0-15 grammes of amyli valerianate each) are given; these are repeated every half hour until the crisis is past. During the following days the preparation should be given at greater intervals. In nephritic colic the remedy acts merely as a stimulant, and relieves the cramp-like pains, while it does not affect the gravel. Three drops are given in capsules with a similar quantity of ether, two capsules being given every half hour or six capsules per diem (//Journ. Pharm. f. Els. Lother//, 1895, p. 155).

TREATMENT OF GALL STONES BY LARGE DOSES OF OLIVE OIL.—Dr. Stephenson cites a case of urgent hepatic obstruction, in which, while waiting for the patient to be received into a hospital for surgical treatment, he decided as a last resource to try the effect of large doses of olive oil. A 3-grain blue pill was given at bedtime, followed by 3 fluid ounces of pure olive oil, the patient being directed to lie on the right side. The next morning the pill acted, but no gall stones were passed, so the oil was continued in tablespoonful doses every three hours during the day. In three motions, which were passed between 8 and 8 p.m., six large gall stones were found, two measuring nearly half an inch in circumference, and faceted. No pain was experienced during the passage of the stones, nor did the oil occasion much nausea (//B.M.J.//, 1895, 1144).

TREATMENT OF LEAD COLIC WITH LARGE DOSES OF OLIVE OIL.—Two things are essential to the successful treatment of lead colic, clearing of the rectum and allaying pains. According to F. Combnable, both these effects are produced by giving large doses of olive oil. He reports a case of 80 grammes; sometimes it is well to render the stomach anaesthetic by means of cocaine menthol, in order to ensure toleration of the oil (//Apoth. Zeit. x., 308).
Notices, Letters, and Answers to Correspondents.

Communications for the current week's Journal should reach the Office, 17, Bloomsbury Square, London, W.C., addressed "Editor," not later than the first post on Wednesday. Telegrams can be received on Thursday morning. Telegraphic Address: "Pharmaceutical Journal, London." Advertisements (except for the "Exchange" column), orders for copies of the Journal, and instructions from Subscribers respecting transmission of same, should not be addressed to the Editor, but delay will be caused. See directions on Editorial page.

Correspondents who wish notices to be taken of their communications must write in ink on one side of the paper only, and should authenticate the matter sent with their names—of course not necessarily for publication. No notice can be taken of anonymous communications.

Drawings for Illustrations should be done with pen and ink (Chinese), and consist of clean, sharp lines, without shading. They should also be sent twice the desired size, so as to allow for reduction.

Names and Formulas should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific terms.

**Query should be addressed "Editor," and will be replied to as early as possible after receipt, answers of sufficient general interest being given under the heading NOTES AND QUERIES.**

LETTERS.

Co-operation Against Cutting.

Mr. Geo. F. Pond, 68, Fleet Street, E.C., says:—"Co-operation is perhaps the most powerful means to combat "cutting"—the dreadful scourge of the trade. But I think it would have to be on a more comprehensive scale than that suggested in the Journals for last week by Messrs. Elliman and Co. 'Three or more manufacturers whose sales are large' will most certainly be very insufficient. No co-operation can be successful unless the trade as a whole, wholesale and retail, join in one body and agree together. It is quite natural for those whose sales are large to make terms agreeable to themselves, but which might be objectionable to the retailer. The man who sells retail must have a voice in the matter with the house that sells wholesale. If the kind of protection which is now adopted by Messrs. Elliman and Co. and a few others is to be extended by its adoption by others whose sales are large, I should very much object to it as lessening my retail profit. I also think that fixing a 'minimum price' is not a good way at all, for the reason that it has the tendency everywhere to fix the article at that price, and make it more difficult to get the full price, say 1s. 1d. The next point is Messrs. Elliman's suggestions I fear will not work, viz., 'the indirect buyer who cuts would be dealt with in a manner to be agreed upon, which need not be made public.' No secret can work for good, and whatever the secret, in business it would soon become known to every one and be no secret. Co-operation is the idea which should not be lost sight of, and if Messrs. Elliman, with some other large houses, would join issue and start a scheme by which the whole trade could join in one trade union, a power would be formed which would soon cut out the cutter. Messrs. Elliman and Co. say there are indications that the time has arrived for co-operation. Many thanks to Messrs. Elliman for their foresight and action, and for their good intentions in what they have already done; but all will be lost unless a united body is got together first."

ANSWERS.

A. W. W.—It is Euphorbia esula, and probably a ballast plant.

George Barker.—Scheele's green is arsenite of copper, impure varieties of which, containing sootate or carbonate occasionally, are known under different names, as Brunswick green, Schweinfurth green, emerald green, etc. Paris green is also generally understood to be an impure arsenite of copper, but the colour prepared by Poirier, Bardy, and Lauth, under that name, was obtained from aniline by oxidation with bromine, chlorine, iodine, aniline acid, arsenic acid, etc. The compound formed was soluble in alcohol, and soda precipitated it from the solution formed.

H. L. Ironmonger.—The plants are Lepidium draba and Eriogerum philadelphicum. Where did you find the latter?

Walker.—Yes, in the note on "Anthion," by a slip of the pen, the word "permanganate" appears in mistake for "potash," but the context should render it sufficiently obvious that the latter is meant.

E. F. Harrison.—All safely to hand, with thanks.

COMMUNICATIONS, LETTERS, ETC., have been received from Messrs. Ball, Barker, Callis, Evans, Gerrard, Harrison, Hill, Kemp, Parker, Reeve, Bideal, Schröder, Shapley, Simmons, Sutton, Tirard, Tutty, Williams.

Obituary.

Taylor.—On May 22, Thomas C. Taylor, Chemist and Druggist, Nottingham. (Aged 48.)

Henderson.—On May 24, James B. Henderson, Chemist and Druggist, Dollar, N.B. (Aged 53.)

Mellor.—On May 25, William Mellor, Chemist and Druggist, late of Great Malvern. (Aged 53.)

Cordley.—On May 27, William B. Cordley, Chemist and Druggist, Colchester. (Aged 46.) Mr. Cordley was local secretary for Colchester, and had been an Associate of the Pharmaceutical Society since 1870.

Brown.—On May 28, Alexander Brown, Chemist and Druggist, Moortown. (Aged 32.)

Holmes.—On May 30, George Holmes, Chemist and Druggist, Haddersfield. (Aged 63.)

Fulley.—On June 3, John Fulley, Chemist and Druggist, Poplar. (Aged 77.)

Woodhouse.—On June 3, R. A. Woodhouse, Chemist and Druggist, Grimsby. (Aged 52.)

Webster.—On June 7, John Henry Webster, Chemist and Druggist, Scarboroughe. (Aged 48.)

Gunn.—On June 8, William Gunn, Pharmaceutical Chemist, Dun's. (Aged 52.) Mr. Gunn had been a member of the Pharmaceutical Society since 1853. From 1873 to 1888 he served as a Police Commissioner, and during nine of these years he was chief magistrate of the burgh.

**Ext. Cocce Liq.**—A "miscible" preparation of coca is frequently called for, it is very convenient for the production of coca wine. Should it be thought desirable that this should replace the present official liquid extract it may be prepared by repercolation with a weak spirit (1 of a.v.r. to 2 or 3 of water), and subsequent addition of glycerin.

**Liniment of Aconite** may be added to these, the percolation being continued to 96 fluid ounces instead of 64 fluid ounces; also the following extracts, resins, etc., may be advantageously pre-
pared by an adaptation of the process, the resulting liquid being submitted to distillation for recovery of spirit, and the residue evaporated to the required constancy. In this way the exposure to heat is far less, owing to the small proportion of liquid to be evaporated.

**Podophylli Resina, Jalape Resina, Scammonii Resina.**—In the final drying of these resins it is important to keep the temperature low to secure greater uniformity of colour, as pointed out by Brookes; below 100° F. would be desirable.

**Type II.**—In these cases the general process is the same as in Type I., with the exception that no percolate is reserved from the second and third percolations, but the whole of the menstruum is carried through the whole series of percolations. Were it not for the inconveniently thick condition attained by the percolate from most drugs, this would be an advantage in all cases. Percolation is continued till the drug is exhausted, but the percolate is always reserved in fractions, evaporation when needed beginning with the weakest. The extracts, etc., on this type are included in the following table. I have previously described (Ph. J., March 18, 1895) its adaptation to the production of liquid extract of belladonna.

**Extractum Cinchona Liquidum.**—Much difference exists in the commercial samples of this preparation, not only in colour, but also in miscibility with water. Some samples throw out a thick deposit; others give a clear or nearly clear mixture. When made strictly according to the B.P. it will always produce a more or less muddy mixture, and as a consequence, if this process remains official, this variability may be expected to continue, for there will always be some pharmacists who prefer to use the more "elegant" preparations. This being one of those cases in which "elegance" can be attained without sacrifice of medicinal activity, I would advocate the adoption of suitable means for its attainment. For this, two points need attention: first, evaporation must be as much as possible avoided, and when used the temperature must never exceed 160° F.; and second, a portion of the acid and glycerin should be added after con-

为中心。我将因此建议

**Take of—**

- Cinchona bark, in No. 40 powder* $\frac{1}{4}$ lbs.
- Hydrochloric acid $\ldots$ 10 fl. drs.
- Glycerin $\ldots$ 8 fl. ozs.
- Rectified spirit $\ldots$
- Distilled water $\ldots$ Of each a sufficiency.

Mix half the acid and glycerin with 36 fluid ounces of distilled water, and having divided the cinchona into four equal portions, extract by re-percolation as described under liquid extract of belladonna, using distilled water to complete the exhaustion. Reserve the first 30 fluid ounces of percolate and evaporate the remainder at a temperature not exceeding 160° F. (85° C.) till it is reduced to 4 fluid ounces; mix this with the reserved portion, and determine the amount of alkalooids.

After having ascertained the strength, every fluid part of the extract containing 5 grains of alkalooids is brought to the measure of 75 fluid grains by evaporation, or if too strong by dilution with water, then 12½ fluid grains of rectified spirit, and the remainder of the hydrochloric acid and glycerin are added, and, finally, sufficient distilled water to produce 100 fluid grains.

To "character and tests" should be added "When mixed with twenty times its volume of distilled water a clear, or nearly clear, mixture should result."

**Extractum Glycyrrhiza, E. Glycyrr. Liquidum, &c.**—After re-percolation with cold water the percolate is raised to the boiling point to coagulate albumin, and completed as usual; in warm weather chloroform water should be employed instead of distilled water, to avoid fermentation, the chloroform being entirely dissipated by the subsequent boiling.

**Syrup of Senna.**—For the preparation of syrup of senna, I prefer extraction by pressure to re-percolation, hence its absence from either of the tables given.

---

**THE STUDY OF MATERIA MEDICA.**

*(Concluded from page 1119.)*

**Roots.**—Anyone who takes up a piece of German aconite root and compares it with a piece of the Japanese drug will notice at once a difference in the external contour, and on breaking them open transversely he will find other differences, the interior of the German root being usually horny and sometimes hollow, whilst the Japanese has a firm, white, starchy character. He will not be able to make out much of the internal structure so far, but he will have learnt that drugs differ in quality. Further examination will show that some of the hollow pieces have a portion of the base of a stem attached at the top, and must consequently have been gathered during the summer, when the root has lost its store of nutriment; whereas the Japanese shows evidence, in the quantity of starch present, and in the absence of the base of the stem, that it was gathered during the late autumn or spring before the new stem had formed, and after the old one had perished. To see the structure more clearly, the surface of the fracture is shaved.

*For larger quantities use bark in No. 30 or 20 powder.*
smooth with a sharp penknife, and wetted. The vascular bundles will then come into view as an irregular ring, which is less decidedly angular in the Japanese than in the German aconite. In this case, as in all others in which the structure is indistinct, the sense of taste may be used. It is well, however, always to be cautious in this respect, and to taste not more than a grain, rejecting the material and taking care not to swallow the saliva. In the case of aconite a tingling sensation arises in about two minutes, and continues, accompanied with or followed by a sense of numbness for a couple of hours, which once experienced produces a permanent impression on the memory.

If proof is needed of the presence of starch in the root it is easily obtained by boiling a fragment in a test tube, and adding a drop of tincture of iodine, or by scraping off a particle from the white surface into a drop of water on a microscopic slide, running a drop of solution of iodine under the glass cover, and drawing it through the water by a piece of blotting paper applied to the opposite side of the cover.

Or pieces of pilloxy root and of dandelion root may be compared. If the roots are broken across and the structure observed under an ordinary lens, the dandelion root will be seen to have a small yellow porous woody centre or stele, and a thick white cortical portion with concentric horny rings, whilst in the pilloxy the woody centre is much larger, is divided into distinct wedge-like portions, and the outer or cortical portion is narrower, with radiating horny lines and small dark dots, indicating the presence of a previously containing bleb. On tasting the two roots the dandelion is found to have a sweetish taste, whilst the pilloxy soon causes a flow of saliva and has a tingling taste, which, however, is without the persistent numbing sensation produced by aconite. If several pieces of liquorice root are next examined, there will be observed in the centre of the end of some of them a small depression, which, on being cut with a sharp knife shows the structure of pith. The apparent root is therefore an underground stem, such pieces being less sweet than the true root in which the pith is absent. In some rhizomes, such as those of Comsigma or Helboreus niger, it is often necessary to break several pieces before a sound specimen showing a firm fracture is met with, and an examination of the rootlets will also afford in some cases characteristic features. In a few like arnicas and veratrum, the diagnostic characters are best seen in longitudinal section.

Barks.—A comparison of the barks of Rhamnus purshiana and Rhamnus frangula may serve as an illustration. On scratching the outersurface with a penknife, a deep crimson layer is seen underneath the epidermis in R. frangula, and the bark is dotted over with whitish lenticels. In R. purshiana the bark is thicker and the outer surface shows a much duller and paler red colour when abraded, and the lenticels do not form a prominent feature. On comparing cusparia bark with nux vomica, the transverse fracture of the former is seen to be of a deep brown colour, and that of the latter of a paler brown. In the former the inner surface is laminated, and can often be separated into thin layers by the nail or a penknife. In the latter the inner surface is firm and not laminated. These two barks are to the naked eye probably more alike than any other two barks, but anyone who has tasted the two and has noticed the peculiar earthy flavour and almost urinous odour of cusparia, and compared it with the persistent pure bitter of the nux vomica, without any flavour or odour, would hardly confound them with each other.

In many barks the structure is so dense that it is difficult to see it without the use of a "platyscopic" lens. This will be found especially useful in examining the transverse section of pomegranate bark, or the inner surface of the bark of Prunus serena.

But anyone who will use the senses of sight, taste, smell, and touch, aided by a sharp penknife and a good pocket lens, will have no difficulty in recognising with absolute certainty any crude drug, whether the specimen be half an inch long or a dozen inches.

Any ordinary pocket lens answers well for most purposes, but a "platyscopic" lens, or the one inch objective of a microscope, is much better for revealing minute details, such as hairs, glands, etc. Avena.—The outer sheaths should be cut open to render them pliable, so as to spread them out to show their outline or divisions. The chief differences in leaves are in the outline, the character of the margins, in the mode of division, in the arrangement of the principal veins or nerves, the more or less prominence of them on one side or the other, and in the presence of hairs, glands, or scales.

A good illustration occurs in the leaf of Digitalis, in which the lateral veins run down at an acute angle into the broad leafstalk, and there are sometimes one or two curved, whilst in Insula conyza, the leaves of which closely resemble it in general appearance, the lateral veins are not decurrent, and the margin of the leaf is serrulate. If a particle of the edge of a leaf of Digitalis, Verbascum thapsus, Insula conyza, and Matico be examined under a microscope, it will be seen that the hairs of each also afford characteristic differences.

Two of the leaves which, perhaps, most frequently puzzle students are belladonna and stramonium, since the leaves become broken in dark, and it is the task to show that the one has an entire and the other a sinuate dentate leaf. In such cases resort must be had to the platyscopic lens. On viewing a piece of belladonna in an oblique light, minute pale dots will be observed all over the surface of the leaf, but on looking at stramonium in the same way the surface is seen to be minutely wrinkled, and the substance of the leaf appears to be thicker. If, however, the microscope be used, even a small particle half the size of a split pea can at once be identified. If soaked in strong solution of caustic potash (60 per cent.) the leaf becomes transparent, and black dots can be seen under a low power of the microscope (4-inch objective). These under a 4-inch objective are resolved in the case of stramonium into globular masses of pyramidal crystals (spharophides), or in the case of belladonna to sandy crystalline grains completely filling the cell. A solution of three parts of chloral hydrate in two of water answers quite as well or better for clearing the cells, but it requires several hours to produce the same effect. Still more can be learned by cutting a section of the leaf placed between two pieces of pith. It will then be seen that the prominent dots on the bolla-
FLOVERS.—These are best examined after being softened in water in a porcelain crucible over a spirit lamp. They are taken out when soft, the superfluous moisture removed by laying them on a piece of paper, and then dried in a warm place. An ordinary magnifying glass supported so as to leave the hands free. A pair of glover's needles (which have cutting edges)inserted in firm holders may be used for dissecting the flowers. Only one flower should be examined at a time, freed from the inflorescence. The flower is held firm with the left-hand needle and dissected with the right-hand one, each of the outer segments being first removed so as to show the number and position of the inner ones, or the flower may be slit open from below upwards with the point of a sharp pair knife. In such cases it will be necessary to take a second flower, preferably one from which the corolla has fallen, to obtain a transverse section of the ovary, and to see the placation. The use of a mirror below the object enables the operator to see the details better. Anyone with a mechanical turn can easily make a useful dissecting microscope out of a small cigar-box.

Larger flowers can be examined with the platyscopic lens, when the leading characteristics can easily be seen, such as the hairy receptacle in arum, the scales or the solid conical receptacle in Roman camomile, and the conical hollow receptacle without scales in Matricaria chamomilla, the rhomboid bractlets in lavender. In the case of the camomile and clove it is well to make a vertical cut through the flower with a sharp knife before examining it. Saffron needs to be soaked in cold water to reveal if present stamens, ligulate florets, and mineral adulterations. The mineral matter, if insoluble, falls to the bottom of the vessel. Soluble salts which are sometimes used to adulterate it can be detected on evaporation of the clear liquid. In powdered flowers, such as insect powder, the characteristic papillae or the ligulate florets; and the glands and hairs characteristic of the flowers must be looked for, an abnormal abundance of the hairs indicating that the foliage has been used as well as the flowers. Mineral matter must be detected by incinerating the flowers and ascertaining if an undue proportion of ash is present.

Frutos and Seeds.—The surface of many fruits affords distinctive characters, as in cumin, fennel, anise, and hemlock. In others it is necessary to cut transverse sections. This is more easily done in the umbelliferous fruits and in such seeds as colchicum, if they are first soaked for a few days in a mixture of equal parts of glycerin and water. A thin section can then be readily obtained with a sharp pair knife, placing the seed or fruit on a piece of soft wood under the tip of the left-hand thumb-nail to keep it firm whilst cutting. A much better section can be obtained by the use of pithe and a razor. For this purpose take two pieces of pith (obtainable from manufacturing jewellers, that of the sunflower stem or elder answers well), cut one side of each smooth with a sharp knife, and place the object to be cut between the two smooth sides, binding the two pieces of pith firmly together by means of cotton thread. In using the razor, the elbows should be placed firmly against the sides of the body, and the thumb of the hand which holds the pith depressed, lest a slice be taken from it as well as from the under side.

The presence or absence of vitreous or resinous cells in umbelliferous fruits is best ascertained in this way. Thus, a section of mature conium fruit shows no vitreous, whilst anise, which resembles it externally, shows about thirty in each half fruit. Coriander has two vitreous on each flat surface, but none on the convex surfaces. In powdered seeds or fruits the special characteristic of structures of each, as given in atlases of pharmacognosy, must be looked for, such as the cells of the endocarp in cubeb and the absence of foreign structures. Occasionally a colour test is very useful as a preliminary, such as the use of sulphuric acid, which gives a carmine colour with the cubebin present in true cubebus, but absent in the adulterations hitherto employed.

The structure of seeds such as mustard, henbane, stramonium, and fenugreek, etc., may be easily made out by softening them in warm water, and then removing the seed coats, when the presence or absence of albumin around the embryo and the folding of the cotyledons is easily seen. The origin of the "worms" which henbane seeds and hot water dissolve out of the pericarp, according to popular belief, will then be easily seen in the form of the curled filiform embryo previously imbedded in the albumin of the seed. Poppy, lobelia, and other seeds show characteristic markings on the external surfaces when seen with a platyscopic lens or a 1-in.-objective.

Gums, Resins, Juices, etc.—The gums gum resin, resins, and juices may be easily distinguished by rubbing their surface with water. If a gum resin contains even a small proportion of gum, as in scammony, it becomes milky, which is not the case with scammony resin. Gum resins also take fire in a flame instead of melting and are only partly soluble in alcohol. Gums either swell up or dissolve to form a mucilage with water, and char when heated. Resins and oleoresins melt and burn readily when heated, a few, however, only swelling up before burning.

Attention may here, however, be directed to the colour tests for aloes. A fragment of true socotrine aloes touched with nitric acid gives a brown colour, but spurious socotrine gives a bright crimson colour. The colour of the powder of aloes differs much according to the kind and the quality, and may be used as a test of either.
The more or less crystalline character of dried juices as seen under the microscope will often afford valuable tests, as in the case of balsam of tolu. In the case of powdered gum, the microscope is also useful in detecting the presence of starch.

Dried juices, like all other plant products, differ in taste, odour or solubility in alcohol and water, and appropriate tests for most of them may be found in textbook materia medica.

For the study of the macroscopical appearance of drugs, Mäisch's 'Manual of Materia Medica' (Trübner) offers useful illustrations. For the microscopical, Vogl's 'Anatomischer Atlas der Pharmacognosie' (Urban and Schwarzenberg, Vienna) is of great value.

THE APPROACHING REVOLUTION OF THE BRITISH PHARMACOPOEIA.

THE WEIGHTS AND MEASURES OF THE BRITISH PHARMACOPEIA.

BY WILLIAM KIRKBY.

The Beginning of the Confusion.

It is now over thirty years since the first edition of the British Pharmacopoeia was published, in which the imperial pound and ounce were made official for the compounding of medicines. Previous to that time it was customary to use the apothecaries' ounce for this purpose. As the latter contained 480 standard grains and the former 347.5, the change was not only a very considerable one, but a very confusing one, because the imperial ounce cannot be divided into aliquot parts containing an integral number of grains. In consequence of this difficulty the editors recommended that prescribers and dispensers should discontinue the use of the drachm and scruple—in other words, that all quantities less than an ounce should be expressed in grains. Imperial measures were likewise adopted for denominations of one ounce and upwards, but for lesser denominations the old apothecaries' measures were retained, notwithstanding that the unit of measure—the mina—bears no simple relation to the unit of weight—the grain.

In the next edition, published in 1867, the same systems were directed to be used for the preparation of medicines; but instead of re-affirming the desirability of prescribers abandoning the drachm and scruple weights, the use of them was made optional. In deference to the general custom of using metrical weights and measures for chemical analysis, the metric system was introduced as an alternative in the processes for the volumetric estimations in this edition. After a lapse of eighteen years the present edition appeared. As I intend to consider with some little detail the weights and measures specified for use in compounding its formulae, I venture to quote at length the short paragraph of the preface which deals with this matter:

"An attempt has been made to introduce a method of setting out the relative quantities of ingredients used in some of the processes by supplementing the respective weights and measures by proportional parts. It was at first proposed that the use of parts should altogether supersede that of weights and measures, but it was thought better, at least for the present, merely to supplement weights and measures by parts when the context permits, and where this can be made more clearly to show the proportion which the several parts bear to each other. Whenever this method is employed the term 'parts' signifies parts by weight, and the term 'fluid parts' signifies the volume of an equal number of parts of water."

Ambiguity.

Although the editors appear to have fully recognised the difficulties incident to the use of the imperial ounce of 437.5 grains, it is extremely disappointing to find such frequent evidence of their indolence as to the value in grains of the eighth part and the half of an ounce. From the lists setting forth the strengths of the galenical preparations it appears that sometimes the eighth of an ounce is 544 grains (tinct. sambul. etc.), and sometimes 55 grains (infus. gentian. comp.). The same lack of decision is shown in the various ways the same fact is expressed. Thus the infusions of valerian, rhubarb, and roses are all directed to be made with a quarter of an ounce of the drug to 10 ounces of water. In the lists of preparations given under the respective drugs, three different ways of expressing the strength are made use of: infusion of valerian is 220 grains to a pint, infusion of rhubarb 11 grains to an ounce, and infusion of roses half an ounce to a pint. In the case of tinctures sometimes the strength is given as 23 ounces to one pint, and sometimes as 544 grains to one ounce. Instead of forming a useful feature of the Pharmacopoeia the lists of preparations given under the drugs and chemicals are liable to give rise to considerable confusion. Ambiguity is not confined to the expression of the quantities, but is imported into the inoffensive little prepositions "in" and "to." In common speech and in pharmaceutical terminology they have meanings which are certainly not identical, but in the Pharmacopoeia they are frequently used in precisely the same sense. Under extract of soocotrine aloes it is stated that the compound decoction of aloes contains "4-3 grains is one fluid ounce," and under myrrh it is said that there are "2-2 grains to one fluid ounce" of the compound decoction. The same mistake is made with regard to Linimentum sinapis compositum, which contains one fluid drachm of castor oil to one fluid ounce, and 8 grains of the ethereal extract of mesereon is one fluid ounce. "To" connotes the idea of addition, an idea which is foreign to both the examples mentioned.

The principal difficulty in the use of the weights and measures adopted by the Pharmacopoeia authorities lies in the fact of the ounce of water having a weight of 437.5 grains and a measure of 480 minims. The result of this is that a solution containing 1 part of a solid in 10 parts, if compounded in weights and measures of denominations above an ounce, will not contain 1 grain in 10 minims, but 1 grain in 11 minims, and 10 minims will only contain 0-91 grain.

A Transitional Period.

Although the paragraph quoted from the preface of the Pharmacopoeia does not contain a definite statement of the reasons which led to the adoption of the system of proportional parts, there can be but little
doubt that it was because the editors felt the great need there was for a system of weights and measures which would permit of centesimal calculations, and they did not see their way to the introduction of the metric system without first establishing a period of transition. The intention was decidedly good, especially as provision was made for the measuring of liquids in accordance with English practice, and not for the weighing of them according to Continental custom. According to what rules it has been applied in the formulæ of the Pharmacopæa I cannot discover. The preface says that it has been employed "when the context permits, and where this can be made more clearly to show the proportion which the several parts bear to each other." This can scarcely have been the only cause for the erratic manner, from the point of view of the preface, in which "parts" formulæ are distributed throughout the Pharmacopæa. All the ointments have alternative "parts" formulæ, whereas only one tincture is so treated. The uniform application of this system to the ointments cannot be for the reason given in the preface, because in some cases nothing whatever is gained in clearness. For example, the ointment of olesate of zinc, in which 1 ounce of each of the two ingredients is directed to be taken, what help is rendered by giving an as alternative the directions for 1 part of each?

Some inexplicable inconsistencies are to be found among the ointments in the relation the two sets of formulæ bear to each other. Unguentum belladonnae and unguentum hydrag. ammon., are directed to be made with 1 part of the active ingredient and 9 parts of the base; but in the former ointment 1 part equals 50 grains, and 9 parts equal 1 ounce (437·5 grains), and in the latter 1 part equals 50 grains, and 9 parts equal 450 grains. It were a waste of time and space to speculate upon the reasons for such anomalous statements. I shall therefore content myself with giving a few more instances to show what a hopeless muddle has been made of what might have been a real stepping-stone to a metric system of weights and measures suited to British requirements. The one tincture favoured with a formula in "parts" is tinctura podophylli; it is given as resin of podophyllinum 1 part, rectified spirit 54-66 fluid parts. One cannot help wondering how this quantity is to be measured without first making an elaborate calculation. Tinctura quinine has precisely the same strength, but no alternative "parts" formula is given; vinum ferrī citrātis has also the same strength and a "parts" formula, but instead of agreeing with that of tinctura podophylli it appears as 1 part of the active ingredient and 55 fluid parts nearly "of the vehicle. Surely the editors must have unbounded confidence in the skill of the men who compound the recipes of the Pharmacopæa, otherwise they would hardly expect them to successfully measure "55 fluid parts nearly." This cannot be seriously intended for a working formula; it is merely a display of the variety of ways in which the same statement may be expressed. The fear of being monotonous has been a bogey—haunting the compliers with a tiresome persistence. As in the imperial weights and measures, so in the "parts" dull uniformity has been most successfully avoided. Unguent. gallic., ung. hydragr. subhlorid., and ung. alnici all have a strength of 80 grains to 1 ounce of base; in equivalent parts it is given in the first as 1 part and 5-5 parts, in the second as 1 part and 5·47 parts, and in the third as 2 parts and 11 parts. It is true that these whimsicalities do not interfere with the production of reliable preparations by the discreet pharmacist, but they do detract very considerably from the value of the Pharmacopæa as a standard work of reference.

INACCURACIES.

The formulæ of some of the galenical preparations are open to a much greater objection than those already noticed. They either do not yield preparations of the strength they are stated to have, or the two alternative formulæ give different results. The compound rhubarb pill is directed to contain 90 minims of oil of peppermint in the Pharmacopœial quantity of mass, but according to the "parts" formulæ it will only contain 80 minims. Many instances of errors of this kind are found among the so-called percentage solutions of alkalds and other poisonous substances. Attention has been so frequently called to these errors that it may seem superfluous to say more than mention them. But at the risk of being considered prolix, I venture to particularize a few of the more apparent discrepancies. Liquor arsenicālis should contain 87·5 grains instead of 87 grains of arsenious acid to carry out the intention of the editors. In Donovan's solution the proportion of the active ingredient is given as 90 grains to the pint instead of 87·5. It would seem the easiest thing in the world to make such simple solutions as liquor atropinis sulph., and liquor sodi arsenici to at least correspond with one another, and they are both stated to have a strength of 1 in 100. Yet the former has 9 grains dissolved in 16 fluid drachms of camphor water (1 in 101 fluid grains), and the latter 9 grains in 2 fluid ounces (1 in 98-2 fluid grains).

The greatest deviation from the percentage ideal occurs in the liquor strychnini hydroclor., in which no allowance has been made for the condensation of the mixture of rectified spirit and water; accordingly the first formulæ results in a strength of 1 grain in 96·7 fluid grains, and the second in a strength of 1 grain in 97 fluid grains. In these alkaldal solutions a deliberate attempt was made to approach true percentage solutions as understood by pure chemists. The effort has been anything but successful. Even if it had been successful, I fail to see of what service it would have been either to the medical man or the pharmacist. In devising formulæ for liquid medicines there are two considerations which should be kept in view: first, the convenience of the prescriber in ordering with certainty and ease; the exact quantity of a medicament in any proportion he may desire, and in remembering the exact strength of all galenical preparations; secondly, the welfare of the patient in being able to measure exactly the prescribed quantity of a medicament when exhibited in the liquid form.
Supposing these alkaloidal solutions do contain 1 grain in 100 fluid grains, the prescriber, if he desires to order a quarter of a grain, must direct the pharmacist to use 27½ minims, because the fluid grain is not a legalised measure. There at once arises the difficulty of measuring the exact quantity, and the prescriber is required not only to remember that these are so-called percentage solutions, but he must also remember the relation of fluid grains to minims. The medical man’s difficulty creates that of the patient, who very rarely, if ever, gets in a dose an aliquot part of a grain of these strong remedies. These solutions are not true percentage solutions because the specific gravity of them is altogether ignored. They are, therefore, neither scientifically correct nor practically useful.

THE END TO BE SOUGHT.

As the measuring of liquid medicines by patients is so convenient and so desirable for the ensuring of accuracy of dosage, it cannot be denied that the only practically useful system for formule for liquid preparations is to have the medicament expressed in terms of weight which are integral parts of the terms of measure. All galenical preparations, standardised or not standardised, should conform to this rule.

In the forthcoming Pharmacopoeia, the simplest way out of the difficulty with regard to percentage preparations would be to adopt the metric system, but modified according to the American plan by measuring instead of weighing all liquids. The non-legalisation of the metric weights and measures for purposes of trade in this country is, however, a great difficulty, but it may possibly be overcome are the publication of the next Pharmacopoeia. If it should only be used in alternative formulae, confusion and inexactness will be again introduced into all the preparations which are prescribed and dispensed in minims quantity. These articles ought to be compounded and prescribed in terms of the metric system only; but if the imperial weights and measures are used, then they ought to contain an integral number of grains in an integral number of minims.

The charming diversity in expressing the strengths of preparations in the present Pharmacopoeia has very serious drawbacks, which do not even need to be mentioned. In future a uniform system of expressing them should be adopted, and I would suggest that the centesimal proportions should be used—so many units of weight in 100 units of volume. To ensure accuracy, liquid preparations should be made up, after the lapse of an adequate period of time to allow of condensation or cooling, to a given volume, with a suitable liquid at a given temperature.

Analytical operations are very rarely carried out with grains and fluid grains, the metric system being almost universally adopted in laboratories. For this reason, if for no other, it is extremely desirable that the quantitative tests of the Pharmacopoeia should be set forth in terms of the metric system, and that the results should be given as percentages.

CHEMICAL NOTES.

CONSTITUENTS OF COTO BARK.—In 1880 Jobst and Hesse (Ph. J. [3], x., 521) described certain constituents of coto and paracoto bark which were non-alkaloidal and differed in the two barks. In coto bark they found cotol, C₉H₆O₄, and dicotol, C₆H₆O₀, and in the paracoto bark five substances, the chief of which are hydrocotol, C₅H₅O₄, and paracotol, C₆H₅O₀. In both barks piperonylic acid was found. To a CH₃COOH solution prepared by Elborne from Venizela coto, Cohen attributed the formula (C₅H₅O₀)₅, the molecular weight not being determined. The matter has since been investigated by Ciamiclan and Silber, the greater part of whose work has since been confirmed by Hesse.

Hesse’s formula for hydrocotol was confirmed, and the presence of two methoxy groups (OH₃) demonstrated by formation of methyl iodide by heating with hydroiodic acid (Zelinski’s method), and the presence of a benzyl nucleus was indicated by the formation of benzoic acid when fused with potash.

When hydrocotol was treated with phosphorus pentachloride, benzo-trichloride and a substance of the formula C₅H₅Cl₂O₂ was obtained, and by reaction of the pentachloride with methyl-hydrocotol (obtained by the action of methyl iodide and potash on hydrocotol), benzo-trichloride, and a compound of the formula C₅O₂Cl₂ was formed.

This latter compound on reduction yielded 1, 3, 5, trimethoxy-benzene. From this it follows that hydrocotol itself must contain a benzyl (C₆H₅CO) nucleus attached to a dimethyl-phloroglucinol residue [C₆H₄(OC₂H₅)₂OH] and will therefore be shown.

The exact linking is not yet demonstrated. Similarly protocotol, another constituent in the bark, was found to be the dioxy-methylene derivative (C₅H₅Cl₂O₂C₂H₅). The other constituents of paracoto bark were shown to be methyl-hydrocotol, methyl-protocotol and paracotol. Paracotol has the formula C₅H₅O₄, and is the dioxy-methylene derivative of phenyl coumalin, a substance found in coto bark.

CH₃COOH

Paracotol.

The constitution of these bodies was proved by the production of piperonylic acid, acetopiperone, and other products, on fusion with potash.

Cotol, the chief constituent of coto bark, was next examined, and found to have the formula C₅H₅O₄, and the constitution is represented by the formula CH₂OH₂C₂H₅(OH)₂CO₂C₂H₅. It is the monomethyl ether of benzyl-phloroglucinol, just as hydrocotol (q.r.) is the dimethyl ether. The constitution was proved by methods similar to those employed in the case of hydrocotol. If these formulae are correct it should be possible to prepare synthetically one of these products.
By the reaction of the trimethyl ether of 1:3:5 trihydroxy-benzene (phloroglucinol) with benzyl chloride in the presence of zinc chloride, a tri-methylbenzyl-phloroglucinol was obtained, which was found to be identical with methyl-hydrocotoin. The identity was proved by crystallographical and other methods.

The synthesis of one of these compounds having been completed, the correctness of the formula proposed is placed beyond doubt.

Hesse has also since shown that the dicotolin described by him is not a pure product but a mixture.

THEBAINES.—The exact relation of thebain to the accompanying alkaloids—morphine and codeine (methyl morphine)—in opium has been an unsettled question, but Freund (Ber., xxvii., 2961; xxviii., 941) has now published the accounts of experiments which conclusively prove the constitution of the thebain.

When thebain is acted on by dilute acids methyl alcohol is produced, in addition to a base—thebain—not isomeric with thebain, as previously stated.

When thebenene methiodide is fused with alkalis all the nitrogen is split off, as trimethylamine, and a non-nitrogenous substance—thebenol—C17H18O, left. This latter compound on reduction with zinc dust or hydrogen iodide and amorphous phosphorus yields a hydrocarbon, probably ethyl-phenanthrene.

When thebenine methiodide is treated with alkalis tetra-methyl-ethylene-diamine is obtained, and not trimethylamine (Howard and Roser, Ber., xix., 1896). When thebain is boiled with acetic anhydride a new compound—acetyl-thebain and methyl-oxyl-ethyleneamine—is formed, the reaction probably being represented by the equation:

\[
\begin{align*}
\text{O} & \\
(CH_3)_2C_16H_{18} & \text{CH}_2 \text{CH}_2 \text{COOH} \\
\text{Thebain} & \\
N \text{CH}_2 & \\
(\text{CH}_3)_2C_16H_{18} \text{CH} \cdot \text{OC} \cdot \text{CH}_2 & + \text{CH}_2 \text{OH} \\
\text{Acetyl-thebain} & \\
\end{align*}
\]

By removing the acetyl radical by alkali, thebaol, (CH3)2C16H18(OH), was obtained.

Thebaol methiodide with acetic anhydride give similar results, but dimethyl-oxyl-ethyleneamine was obtained. Thebaol-thiol, on oxidation with chromic acid and acetic acid, yielded acetyl-thebaol-quinone, which with alkali yielded thebaol-quinone. The reactions of this substance showed itself to be a derivative of phenanthenquinone. The thebaol is, therefore, represented as a derivative of phenanthenene, and bears a simple relation to morphine:

\[
\begin{align*}
(HO)_2C_16H_{18}O & \text{C}_4 \text{C}_16H_4 \\
\text{Morphine} & \\
(\text{CH}_3)2C_16H_{18}O & \text{C}_4 \text{C}_16H_4 \\
\text{Thebain} & \\
\end{align*}
\]

ELDER FLOWERS of excellent appearance and odour have proved (Nordisk. farm. Tidskr.) on close examination to contain florets of Achillea millefolium.

BOTANICAL NOTES.

INFLUENCE OF CALCIUM AND MAGNESIUM ON THE GROWTH OF PLANTS.—As the result of experiments on the growth of various algae, chiefly species of Spirogyra, Zygnema, and Moussaea, Herr Th. Bekorny states that calcium is more indispensable to their growth than any other mineral element except potassium, without which the plants cannot be formed. In the absence of calcium, vegetable growth is very feeble. The want of this element has especially a deleterious effect on the formation of chlorophyll, while the absence of both calcium and magnesium acts prejudicially on the development of the nucleus (Botanisches Centralblatt, volume Ixx., 1895, page 1).

SUGAR OF AGAVE.—In 1892, MM. Michaud and Tristan claimed to have separated from the sap of Agave americana a new sugar with the formula C12H22O11, to which they gave the name agavoce, differing from all others of the same group, except syrnanthrose, by its inactivity. From a careful series of experiments, Mr. W. E. Stone and Mr. D. Lot (American Chemical Journal, May, 1895) now state their conclusion that this sugar has been erroneously described as having distinct properties, and that it is identical with sucrose.

ACTION OF THE WATER OF THE SOIL ON VEGETATION.—From a series of experiments on the growth of plants in different soils, chiefly on Brizgona caesarea and Phascolus multiflorus, and on the production of root-tubercles in Lupinus albus, M. E. Gain asserts that each species has its own optimum of humidity, and that this has a special influence on the development of the tubercole-microbe Rhizobium leguminosarum; this optimum further varying in each species, according to its stage of growth. Saturation of a soil previously dry introduces important perturbations in the supply of sap. Transpiration is most energetic when the soil is moist. If the optimum of turgescence of a plant is exceeded, transpiration decreases. There is, in fact, at every moment of growth an optimum turgescence for the functions of nutrition (Bonnier's Rev. Gén. de Botanique, 1895).

ABNORMAL GERMINATION.—Herr A. Winkler has collected together all the examples known of abnormal modes of germination.

Cotyledons are wanting in Ranunculus ficaria, Coptidis bulbocapnos, and Cucuta; while Ranunculus glacialis and Carum bulbocatatum have only one cotyledon. Subterranean germination takes place in a number of plants. In others either the cotyledons themselves or their pedicels form a sheath which encloses the growing point; while a coalescence of the lamina of the cotyledons takes place also in the horse-chestnut. Ceratophyllum and all species of Linum, except L. aromum, have apparently four cotyledons. A number of examples are also recorded of deviations from the ordinary form of cotyledons, of inequality in the size of the two cotyledons, and of abnormalities in the development of the seedling (Verhandl. Bot. Vereins. Prov. Brandenburg, 1895, p. 125).
advantages that accrue to the community from the freedom with which a patentee whose results are protected can develop his patent, the Pharmaceutische Zeitung considers that the possibility of patenting a medicinal substance has been distinctly advantageous to the community at large, by facilitating the rapid dissemination of medicinal agents that have proved themselves really useful. With respect to patented methods it is sufficient, says the journal referred to, that extract of opium, for example, shall be required to possess certain characters; how or by whom the extract is prepared is a matter of no moment, provided only it complies with the requirements laid down. It is for the Pharmacopoeia authorities and for the craft to protect themselves from unpleasant consequences by careful attention to, and more extended recognition of, the rights legally due to valid patents and registered trade marks.

The advantages that accrue to the community from the protection afforded by the patent laws and trade mark regulations to the brain work of non-capitalists are sufficiently evident. Manifestly it would be unreasonable, unjust, and indeed impossible to exclude from the enjoyment of such protection those whose industry has taken a particular direction. The more important question, and one which at the present moment is vexing both pharmacists and physicians in this country, relates to the introduction of such patented preparations or methods of preparation into the national medicine book. Shall patented preparations or methods be admitted, directly or indirectly, into the British Pharmacopoeia? The chief consideration affecting the reply to this question is that the Pharmacopoeia has for its object the definition of substances which the physician prescribes, and such as are required to be kept at one safe and uniform standard of strength and composition; in other words, the object of the Pharmacopoeia is the control of the quality of certain selected medicines. At first sight it would appear that by defining the characters which patented preparations must possess, their safe and uniform strength and composition would be guaranteed, and their quality controlled. But in this case, as with all monopolies, the control which the Pharmacopoeia can directly exercise over such preparations is illusory, and this applies equally to chemical compounds and to galenical preparations so defined as to be producible by one process only, and that one patented.

That this is so is clear when it is considered that the monopolist has it in his power to change the composition of his patented preparation within limits determined by the patent; this, in the case of such patented methods as the sodium chloride process for vegetable extracts, being not only conceivable but probable. In such cases the pharmacist would
be powerless to effect any change, to exercise any control, and might possibly find himself called upon by the physician to supply an article which he could not obtain, of the quality demanded, from the monopolist, whilst the law would not permit him to manufacture it. Not single preparations only but whole classes of preparations might in this way become the property of monopolists, into whose power the pharmacist and the physician, bound hand and foot by the Pharmacopoeia, and through them the whole community, would be completely delivered. Still worse will be the case with preparations introduced under registered names, for a patent is terminable, but a registered name may endure for ever. The compromise effected in the Addendum to the British Pharmacopoeia in 1890 by which patented preparations were introduced under newly coined names has proved futile; "phenazonum" is so seldom prescribed that it might be expunged, and there appears to be no other satisfactory course than to rigidly exclude all patented preparations and methods and all registered names. English pharmacists would then be delivered from the cares that are harassing their German colleagues. At the same time no injustice would be done to the inventor, physician, or community, for the first may protect his work, the second order monopolised preparations, and the third enjoy all the benefit possible from both. But to lay upon the pharmacist the paradoxical burden of controlling constantly increasing uncontrollable preparations is manifestly unreasonable and unjust. When by the expiration of the patent rights the manufacture of such preparations is free, then, and not till then, should they find a place in the national medicine book, and then only under a name not registered. Physicians may then prescribe under that new special name a remedy directly controlled by the Pharmacopoeia they compile, or under the old registered name a similar preparation controlled by the monopolist manufacturer.

PHARMACOPEIAL WEIGHTS AND MEASURES.

The editor of the British Medical Journal is to be congratulated on having secured the services of a well-known pharmacist to contribute an article dealing with weights and measures, in the series on the approaching revision of the British Pharmacopoeia. This article, by Mr. William Kirkby, is reproduced at page 1173 of this week's Journal, and will be found to describe the anomalies existing under the present arrangements both clearly and succinctly. That much confusion has been caused by the use in pharmacy, side by side, of two distinct ounce weights, and the lack of simple relation between the units of weight and measure, is too well known to require emphasizing. That more confusion, indicated by the existence of curious discrepancies and marked inaccuracies, has resulted from the erratic manner in which quantities are stated in the Pharmacopoeia, in terms of the imperial system, is easily shown by Mr. Kirkby.

Pharmacists generally, therefore, will gladly welcome any change which tends to simplify matters and strengthen their hands in the matter of attaining greater accuracy and uniformity. They will also sympathise with and cordially support the statement that the only practically useful system for the formulation of liquid preparations is that according to which solids are weighed and liquids measured, this holding good for the convenience of physician, dispenser, and patient alike. All galenical preparations should certainly conform to this rule, whether the quantities be expressed in terms of the imperial or metric system, or both. Ultimately, the metric system of weights and measures will doubtless entirely supplant the imperial system, in the British as in other pharmacopoeias. Meanwhile, however, it may appear, on the whole, wiser to represent the terms of both, side by side.

The last method is that which there is every reason to expect will be adopted, and it is to be hoped that the contrast between the two systems, which will in reality serve the present generation as an easy transition from the old to the new, will not be muddled by the introduction of the fluid grain in place of the minim. Few realise practically what a fluid grain is, and its introduction during a transitional period would but make confusion worse confounded. The imperial system should be stated in its simplest terms—grain, ounce, pound, minim, pint—without intermediate steps; and similarly, the metric system should be marked with equal simplicity—milligramme, gramme, kilogramme cubic centimetre, litre. The convenience of the metric system will soon demonstrate itself in the compounding of official preparations. If, then, medical practitioners will but acquire the habit of prescribing in terms of the same system, it may reasonably be anticipated that before another British Pharmacopoeia is needed, the time will be ripe, and both medical men and pharmacists will be ready, for its exclusive use.

QUALIFICATIONS OF PUBLIC DISPENSERS.

A general order has just been issued by the Local Government Board altering the regulations concerning the qualification of dispensers, in thirty-nine unions and separate parishes, the unions being those of Birkenhead, Cardiff, City of London, Derby, Fulham, Gloucester, Greenwich, Hackney, Holborn, Nottingham, Plymouth (Incorporation), Poplar, Portsea Island, Reading, St. George's, St. Olave's, St. Saviour's, Stepney, Strand, Walsall, Wandsworth and Clapham, Westminster, Whitechapel, Wolverhampton, Woolwich,
and the separate parishes, those of Birmingham, Mile End Old Town (Hamlet), Paddington, St. George-in-the-East, St. Giles (Camberwell), St. Giles-in-the-Field and St. George, Bloomsbury (United Parishes), St. Leonard (Shoreditch), St. Luke (Chelsea), St. Mary Abbotts (Kensington), St. Mary (Islington), St. Mary (Lambeth), St. Marylebone, St. Matthew (Bethnal Green), and St. Pancras.

The effect of the alterations is that for a person to be qualified for appointment as a dispenser in any of the above-mentioned unions and parishes he must be a Licentiate of the Society of Apothecaries of London or a qualified Assistant of that body, or he must be registered under the British or Irish Pharmacy Acts, or "a compounder of medicines duly qualified in accordance with the Regulations for the Army Medical Staff Corps." According to these Regulations, non-commissioned officers and privates who have had six months’ training and instruction in the surgery of a military hospital are entitled to qualify as compounders of medicines. They are instructed during that time in a knowledge of Latin names and words, and the symbols used in prescriptions and on the printed labels used in a dispensary, but are not expected to be able to translate into English instructions written in Latin. They must also know the B.P. drugs, their appearance, taste, odour, and dose; as well as the official preparations of the drugs, their composition and dose. The names, characters, and dangerous doses of poisons are to be studied, and a knowledge gained of antidotes and measures to be adopted in cases of poisoning. The reading, making up, labelling, and mode of administration of the remedies ordered; the names and proper care of surgical instruments and other appliances; and the preparation of returns of medical stores, surgical instruments, etc., are the remaining matters to which attention must be devoted.

It is quite evident that this course of training is far from deserving to be compared with that of persons qualified under the Apothecaries or Pharmacy Acts, even though the six months’ course be supplemented by an examination. With regard to the system of examination adopted it is difficult to speak, for although paragraph 224 of the 'Manual for the Medical Staff Corps' distinctly states that "the rules regarding examination for compounders of medicines are contained in the Regulations for Army Medical Services," the most careful search of the latest edition of the Regulations fails to reveal the faintest scrap of information on the subject, and the authorities can be cordially congratulated on their skill in hiding the rules. Whatever these may be, however, the fact remains that individuals with no knowledge of the subject worth mentioning are placed upon an equal footing with others who are required to produce evidence of being thoroughly skilled as dispensers. It may be that the reason for entitling army compounders to be appointed as public dispensers is the outcome of a desire to afford employment to soldiers whose time of service is expired, but this, though perhaps laudable in intention, is hardly in accordance with modern notions of what is requisite for the public safety.

**HERBARIUM PRIZE.**

Subscribing "Students" of the Pharmaceutical Society, under twenty-one years of age, are reminded that Monday, July 1, is the latest day on which collections of plants can be received for the Herbarium Prize competition, by the Secretary of the Pharmaceutical Society, 17, Bloomsbury Square, W.C. No collection may contain more than one hundred and fifty specimens, and these must be carefully selected and mounted so as to display characteristic generic features of British phanerogams and ferns, quality of work being considered rather than number of specimens in awarding the prize. Last year only two collections were sent in, and neither was regarded as worthy of the Silver Medal offered, so that the competition cannot be regarded as being either excessive or unduly severe.

**PROCEEDINGS UNDER THE PHARMACY ACT.**

At the Bloomsbury County Court, on Thursday last, the case of the Pharmaceutical Society v. Hills, adjourned from May 23 (see ante, p. 1107), came before His Honour, Judge Bacon. The defendant, Mrs. Lavinia Hills, of 91, Lower Marsh, Lambeth, was sued for a penalty in respect of the sale of Powell's balsam of aniseed, but claimed that her deceased husband was in business before 1875, and that she was therefore entitled to carry on the business under Clause XVI. of the Pharmacy Act, 1868. It appears, however, that the deceased never became registered as a chemist and druggist, and, moreover, the assistant conducting the business, described as a qualified apothecary, is not a "duly qualified assistant" within the meaning of the Clause, which stipulates that such assistant shall be a Pharmaceutical Chemist or a Chemist and Druggist, registered by the Registrar under the Pharmacy Acts. Judgment was given for the Society (see page 1189).

**PROPOSED BOARD OF REFERENCE.**

In giving evidence as Chairman of the Special Purposes Committee of the Kensington Vestry, before the Select Committee on Food Products and Adulteration on Tuesday last (see p. 1186), Mr. R. A. Robinson was careful to point out that a satisfactory Board of Reference should include a nominee of the Pharmaceutical Society. The suggestion which has been made that the General Medical Council’s nominees might fairly be regarded as representing pharmaceutical interests is not worth a moment's consideration. Representation to be of any real value should be direct, and if other traders affected by the Sale of Food and Drugs Acts were combined into recognised societies, they also should be entitled to nominate representatives.
SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting was held on Thursday, May 30, Mr. J. R. Walker occupying the chair.

A paper was read on—

COMMERCIAL LIQUID EXTRACT AND TINCTURE OF CINCHONA.

BY HAROLD BROWN.

In selecting a subject for a short paper for this Association, the idea suggested itself that it would be interesting, in view of the present demand for an increased number of standardised preparations in the new Pharmacopoeia, to see how far some commercial samples of one of the already standardised preparations came up to the prescribed strength.

The choice of such at present is not very wide, and we are restricted to preparations of three drugs: opium, nux vomica, and cinchona. The latter was chosen because as far as our experience goes its standardised preparation—the liquid extract—is rarely either prepared by the retail pharmacist or the bought article assayed by him, and we are consequently at the mercy of the wholesale houses.

At the same time samples of the tincture were examined, for, although not standardised, it is directed to be made from bark of a definite strength, and might therefore be expected to yield fairly constant results. A number of samples of each were obtained from representative sources, and the following are the results of their examination:

---

Liquid Extracts of Cinchona.

The samples were of uniform appearance, except No. 2, which was exceedingly light in colour and very acid. It also had a peculiar odour, recalling that of peptic preparations. From its appearance its preparation by the official process seemed doubtful, and an attempt was made to determine the amount of extractive which it yielded compared with that from the other samples. Owing to the difficulty in getting rid of the glycerin present, which prevented a dry residue being obtained by evaporation over a water bath, this was not satisfactorily accomplished.

The official process of determination was employed, and the quantity operated on was 10 Cc. In every case the alkaloidal residue was more or less coloured.

</tbody>
</table>

From these figures it will be seen that of the five samples examined, two were fairly approximations to the official standard of 5 per cent., while the other three showed a much lower percentage.

It would therefore seem that the standardisation of a preparation in the Pharmacopoeia affords no guarantee of the strength of the commercial article.

The only virtue of standard preparations lies in their constant strength, and the pharmacist should see, either by preparing them himself or by checking the commercial sample, that that strength is maintained.

Tinctures of Cinchona.

The appearance of the samples is given in the table below. Their specific gravities were first determined. To determine the amount of alkaloid present, 1 fluid ounce was acidified with dilute H₂SO₄ and evaporated over a water bath until all the spirit had been driven off. The acid solution was filtered, rendered alkaline with ammonia, and the alkaloids extracted by agitation with chloroform. The latter was separated and divided into two equal portions. One of these was evaporated to dryness and the residue weighed. With the other an attempt was made to determine the alkaloids by titration with decinormal acid, using ephedrine as the indicator. The results obtained by the latter method were very different to those yielded by the gravimetric process, being in some cases more than double. In searching for an explanation of this discrepancy reference was made to a paper by Messrs. Farr and Wright on "Gravimetric and Volumetric Methods for the Determination of the Alkaloids in Alkaloidal Tinctures," read at the last Pharmaceutical Conference. From this it appears that considerable difficulty is experienced in assaying the cinchona alkaloids by titration, owing to the indistinct end-reaction. In their hands, using methyl-orange, iodosine and phloxine as indicators, the process gave very abnormal results; in some cases twice as great as those obtained by weighing. The following table is calculated from the gravimetric results.

The specific gravities found appear to be about the average, and do not indicate any considerable deficiency in spirit. The amount of alkaloid present was, however, so low in some cases that previous papers on the subject were referred to for comparison.

Some years ago Mr. Ward, of Liverpool, examined several samples of the tincture, and found that the specific gravity varied from 0.911 to 0.965, while the alkaloid from 1 fluid ounce varied from 7716 to 18827 grains. A sample prepared specially by himself for the purposes of comparison with bark and spirit of official strength, had a specific gravity of 0.920, and yielded 19398 grains of alkaloid per fluid ounce. He therefore concluded that when the tincture is prepared in strict accordance with the official process only 44-27 per cent. of the alkaloids present are extracted. Messrs. Farr and Wright, however, in their work on the tinctures, have found that alcohol
of 50 per cent. strength (by volume) will extract 60 per cent. of the alkaloids present when the official process is employed.

Looking at the much lower percentages found the conclusion seems to be that the majority of the specimens were made from bark much below the official strength, and pharmacists who prepare their own tinctures would do well to first ascertain the quality of the bark supplied.

That such an important preparation as tincture of cinchona should show such variations in its strength cannot be regarded as very satisfactory. Standardisation is of course suggested as the only remedy, though our experience of the liquid extract has somewhat shaken our faith in the efficacy of this. However, suggestions have already been made by Messrs. Farr and Wright for this object, and perhaps these may be acted upon.

The paper was followed by a discussion, in which the Chairman, Secretary, Messrs. Bastow, Jealors, Davis, and Lilly took part.

The Secretary stated that he had received a communication from Mr. C. S. Ellis—whose report on organic chemistry should have been read at this meeting—to the effect that he had not prepared it; also that he had received a similar communication from Mr. R. G. Guyer respecting his report on analytical chemistry, due at the next meeting. The following resolution was thereupon unanimously passed: "That the Association regrets the failure of some of the reporters on science to carry out the duties they undertook, and hopes that in future members will be selected for the office who can be relied upon to fulfil their obligations."

A meeting was held on Thursday, June 13, Mr. T. A. Henry, Vice-President, in the chair. Mr. H. T. Durant, Reporter on Physics, read a report on:—

**THE LIQUEFACTION OF GASES.**

In this, the author gave a brief sketch of the methods used in the liquefaction of the gases up to the present time, together with some of the more important results and deductions. Faraday liquefied chlorine in 1823, and Davy subsequently obtained a similar result with sulphurous anhydride, hydrocyanic acid, and hydrochloric acid. In 1835, Thiloner liquefied carbon dioxide, and since then most of the so-called "permanent" gases have been reduced to the liquid form. Calletet and Piclet's work was referred to, and Dewar's work was also dealt with at some length.

A discussion followed, in which the Chairman, Secretary, Messrs. Bastow, Walker, and Jealors, took part.

**RADLAUER'S BISMUTHOL** is a bismuthic phospha-salicylate. It is said (Apatl. Zeitung) to combine in one preparation the antiseptic properties of bismuth, phosphoric acid, and salicylic acid.

**ROYAL INSTITUTION OF GREAT BRITAIN.**

**SCIENTIFIC USES OF LIQUID AIR.**

BY PROFESSOR DEWAR, M.A., LL.D., F.R.S., M.I.E.

When Faraday was working on liquid gases in this Institution about 1823, with such means as were then at his command, his inquiry was limited to the determination of the specific gravities and vapour pressures of such bodies. Twenty years later, by the use of solid carbonic acid, the greatest cold then possible was obtained, and Faraday made admirable use of Thilorier's new cooling agent to extend his early investigations. Just as liquid carbonic acid produced in glass tubes was of no use as an agent for effecting the liquefaction of more resisting gaseous matters, until it could be manipulated in the solid state, so liquid air, until it could be handled, stored and used in open vessels, like any ordinary liquid, could not be said to possess scientific uses in any wide sense. Such operations become easy when double-walled vacuum vessels (such as were described in a former lecture) are employed in the conduct of experiments where substances boiling at very low temperatures have to be manipulated. The chief scientific use of liquid air consists in the facilities it gives for the study of the properties of matter at temperatures approaching the zero of absolute temperature. In this lecture the expression liquid air may mean either oxygen or air. Where a constant temperature is required, oxygen is used. Liquid air made on the large scale may contain, after it is collected in open vacuum vessels, as much as 50 per cent. of oxygen. Such a liquid boils between -192° and -182° C., and the longer it is stored the nearer it comes to -182° C., or the boiling point of pure oxygen. For a number of experiments of a qualitative character, whether it is liquid air or oxygen that is used makes no difference. In many of the experiments to be recorded, liquid oxygen made from the evaporation of liquid air was employed. In pursuing this subject in concert with Professor Fleming, a long series of experiments, involving the use of large supplies of liquid oxygen, have been carried out on the electric resistance of metals and alloys, and the results warrant the conclusion that at the zero of absolute temperature all the pure metals would be perfect conductors of electricity. Under such conditions a current of electricity started in a pure metallic circuit would develop no heat, and therefore undergo no dissipation. Similarly, we infer there would be no Faraday effect at the zero. In other words, the passage of electricity from one metal to another would take place without evolution or absorption of heat.

Further investigation, along with Professor Living, on the refractive index of liquid nitrogen and air, has led to the conclusion that the refractive indices of nitrogen and air are respectively for the D-ray, 1.2035 and

* Lecture delivered January 19, 1895.
† "On the Refractive Indices of Liquid Nitrogen and Air," by Professors Living and Dewar.—Phil. Mag., 1893.
12062. In these determinations, instead of using the prisms we have employed the method of Teguem and Tranmun, which consists in suspending in the liquid two plates of glass with a thin layer of air between them, and measuring the angle of incidence at which the chosen ray suffers total reflection at the surface of the air. As all the vacuum vessels are either spherical or cylindrical in form when filled with liquid, they act as lenses which are irregular and full of striations. Further, small bubbles of gas being given off in the liquid rendered any image indistinct when viewed with a telescope. In order to avoid the necessity of observing any image through the liquid, it was used simply as a lens to concentrate the light observed on the slit of a spectroscope. Under such conditions the observations were easily executed and the results satisfactory.

For some time a series of observations on the thermal opacity of liquid oxygen and nitrogen have been projected. It is, however, exceedingly difficult to experiment in such a way as to eliminate the absorbing action of the glass vessels, and as the use of rock salt is impracticable, the absorption of heat of low refrangibility remains for the present undetermined. It is possible, however, to use the glass vacuum vessels to determine approximately the relative thermal transparency for heat of high refrangibility, such as is radiated by a colza lamp. The following results represent the heat transmitted through the same vacuum vessels filled with different liquids, taking chloroform as the unit for comparison and correcting for differences of refractive index:

<table>

* From this result it follows that liquid oxygen is nearly as transparent to high temperature radiation as chloroform, which is one of the most transparent liquids next to carbon bisulphide. Liquid ethylene is much more opaque. These results must, however, be considered only as an approximation to the truth, and as generally confirmatory of the inferences Tyndall drew as to the relation between gases and liquids as absorbers of radiant heat.

Instead of silvering the interior and exterior of the vacuum vessels, it is found convenient when using mercury vacua to leave a little excess of liquid mercury, in order that the act of filling the inner vessel with liquid air should cause a fine silvery deposit of the metal over the exterior surface of the inner vessel. In such a vessel liquid air or oxygen shows no signs of ebullition, the surface remains as quiet and still as if it was ordinary water. The supply of heat is cut down to less than four per cent. of what it is without exhaustion and silverying in good vacuum vessels. The result is that volatile liquids can be kept thirty times longer. Such vessels do not, however, maintain indefinitely the high standard of heat isolation they possess the first time they are used. After repeated use all vacuum vessels employed in the storage and manipulation of liquid air deteriorate.

The rapidity with which a space is saturated with mercury vapour (which we know exerts a pressure of about one-millionth of an atmosphere) is easily proved by simply filling a barometer in the usual way, and then instantly applying a sponge of liquid air to a portion of the glass surface of the Torricellian vacuum space, when a mercury mirror immediately deposits. It is important to know the amount of mercury deposited from a saturated atmosphere which is maintained (containing excess of liquid mercury) at the ordinary temperature, the condensation taking place when liquid air or oxygen is discharged into a vessel surrounded by such a Torricellian vacuum. If the deposit on the cooled bulb is allowed to take place for a given time, the outer vessel can then be broken and the amount of mercury which coated the bulb ascertained by weighing. Knowing the surface of the cooled bulb, the amount deposited per unit of area can be calculated. In this way it is found that in ten minutes 2 milligrammes of mercury per square centimetre of surface was deposited. Considering that one-tenth of a milligramme of mercury in the form of saturated vapour at the ordinary temperature corresponds to the volume of 1 litre, this proves that the equivalent weight of 20 litres had been condensed in the space of ten minutes. This plan of cooling a portion of the surface of a vessel by the application of a liquid air sponge, enables us to test our conclusions as to the amount of matter present in certain vacua. Here is a globe of the capacity of 1 litre. It has been filled with, presumably, nothing but the vapour of mercury, by boiling under exhaustion and subsequent removal of all excess of liquid. Such a flask ought to contain mercury in the gaseous state that would weigh rather less than one-tenth of a milligramme, assuming the ordinary gaseous laws extend to pressures of less than one-millionth of an atmosphere. Now we know by electric deposition that one-tenth of a milligramme of gold can be made to cover one square centimetre of surface with a fine metallic deposit. Considering the general similarity in the properties of mercury and gold, we should therefore anticipate that if all the mercury vapour could be frozen out of the litre flask it would also form a mirror about one square centimetre in area. But after one such mirror is deposited, the renewed application of a second liquid air sponge to another portion of the surface would cause no visible deposit. This is exactly what takes place. If, however, two spheres, one much larger than the other, are joined together by means of a tube about 2 mill. in diameter and 50 mill. long, the whole space being a Torricellian vacuum (with some excess of mercury), then on decanting, the mercury may be transferred to the smaller sphere. Now if an air sponge is applied to a portion of the surface of the larger sphere, a mercury mirror instantly deposits, but on applying a new air sponge to another portion of the surface, no further mercury mirror is formed. The narrow glass tube prevents the excess of liquid mercury in the small bulb supplying vapour rapidly to the larger one, so that the local cooling to -180° C. of a portion of the surface has practically condensed all the mercury in the larger space, although the small one is still
filled with saturated vapour and a free communication exists between them. If while in this condition the small bulb is inclined so as to allow a drop of liquid mercury to fall into the lower side of the large bulb, which has not been cooled, instant deposition of mercury takes place on the liquid air cooled portion of the upper surface. Under very small pressure of vapour, therefore, equalisation of pressure of two bulbs communicating by a narrow tube is a very slow process. There are cases, however, in which the application of a sponge of liquid air to the surface of a vessel causes no visible deposit, and yet the inference is that something has been condensed. The best arrangement to show this effect is to select highly exhausted vacuum tubes containing phosphorescent materials like alumina and other minerals, and to arrange the induction coil spark gap of a little greater resistance than the vacuum tube. On starting the coil the current passes solely by the vacuum tube, but immediately the liquid air sponge cools a portion of the surface of the bulb, the discharge shifts to the air gap. During the cooling the phosphorescence of the glass tube is greatly increased; but finally the resistance may become so great that all discharge in the vacuum tube ceases. Some old tubes belonging to the late Dr. de la Rue have given valuable deposits near the electrodes, and in many the diameter and distribution of the strie are materially changed during the local cooling to –190°C. When large vessels containing nothing but mercury or iodine vapour as a residuum of the vacuum space are rubbed with a cotton wool sponge of liquid air in a dark room, luminous glows filling the vessel take place occasionally, or bright flashes of light which enable the shape of the vessel to be seen. The ordinary mercury vacuum vessels show the same phenomena, which is doubtless due to electric discharges caused by friction and cooling.

The optical properties of bodies cooled to the temperature of boiling liquid air will require long and patient investigation. An interesting fact easily observed is the marked change in colour of various bodies. Thus, for instance, oxides, sulphide, iodide of mercury, biocomate of potash, all become yellow or orange; while nitrate of uranium and the double chloride of platinum and ammonium become white. Chromic acid, dilute solution of iodine in alcohol, strong solutions of ferric chloride and other coloured solutions become greatly changed. Such facts are sufficient to prove that the specific absorption of many substances undergoes great changes at the temperature of –190°C.

The tranquil atmosphere of air above the surface of the liquid in cylindrical or spherical vacuum vessels is a convenient place to cool very fragile bodies. During the slow evaporation of the fluid, gas between –190°C and –180°C is given off, which has three times the density of ordinary air, and it falls slowly over the mouth of the vessel in a heavy stream. On dipping into this atmosphere small soap bubbles, they contract rapidly and then freeze. If a soap film is made on a circle of thin wire about two inches in diameter, and allowed to stand until it shows the various orders of coloured bands, and it then carefully dipped into the cool air, it freezes, showing all the original colours. The black band is, however, always broken. Speaking of films, an interesting experiment may be made with a thin stretched sheet of India-rubber, such as is used for making balloons. It is well known that stretched India-rubber contracts when heated and expands when cooled. Now this can be shown very easily by covering a glass funnel or the end of a cylindrical vessel with a stretched sheet of India-rubber as thin as the walls of balloons. Such a surface is quite flat and fairly transparent. If a sponge of liquid air is drawn across the surface, the course is marked by a series of wrinkles, due to the temporary expansion of the rubber caused by the extreme cold. The sheet of rubber being extremely thin, soon regains the ordinary temperature, and the surface then is as flat and tense as before. During the continuous motion of the cotton wool liquid air sponge over the rubber surface, it is followed by wave-like depressions which disappear almost as quickly as they are formed. The elasticity of India-rubber, after cooling to –182°C and re-heating, seems unimpaired.

Organic substances that only become solid at very low temperatures may be divided into two classes: those which crystallise, and those which form glasses. Thus bisulphide of carbon, tetrachloride of carbon, methyl alcohol, hydride of amyl, all form crystals, whereas ethyl alcohol, amyl alcohol, turpentine, ethyl nitrate, chinoline, picolin, are glass-like. If a few drops of bisulphide of carbon are added to alcohol and the mixture cooled to –180°C, a white solid emulsion is formed, whereas the addition of tetrachloride of carbon to the alcohol resulted in the production of a clear solid without any separation. In the same way pure methyl alcohol crystallises easily, but the addition of a few drops of ethyl alcohol prevents crystalisation and causes a glass to be formed. Thus the examination of the behaviour of organic bodies at low temperatures may be a fruitful means of organic investigation.

(To be continued.)

Reviews and Notices of Books.

In this small book the author records the results of experiments which he was induced to undertake after observing the effect of inhalations of turpentine and other essences on the voice. An introductory chapter is devoted to a detailed explanation of the physiological factors concerned in voice production, and the different theories on the subject that have been advanced from time to time are briefly summarised. The record of experiments follows, the effects of inhalations of alcohol of different strengths and in various combinations being first described. As might be expected the effect diminishes with the strength of alcohol.

It is agreeable to learn from the preface to this work that the author recognizes the fact that the medical student cannot reasonably be expected to be familiar with the commercial qualities of drugs, or with the details of the manufacture of their preparations. Even a knowledge of the nature of medicines and of the proportions of active ingredients they contain is a severe burden to the memory, and one which the author endeavours to lessen by an explanation of principle and careful classification. This endeavour has met with complete success. The classification has been carefully and judiciously accomplished, and the principles which underlie the processes adopted for the various preparations concisely stated. In this way an excellent general view of all the galenicals of the Pharmacopoeia is obtained, and the student saved much loss of time. So satisfactory is this portion of the work that it can be strongly recommended to the student of pharmacy as well as to the student of medicine, and indeed it should prove of greater value to the former. The book is of convenient size and, especially if interleaved, should prove a handy class-book.

This work is the first one published in recent years that is specially devoted to the law of designs, and is intended to present an exhaustive exposition of the English law of copyright in designs, the text containing all cases relating to designs, reported up to the end of February last. The practice relating to proceedings in the Courts and in the Patent Office is also fully described, and there is an appendix of statutes, rules, and forms, the international convention, etc., etc. Some 20,000 designs are registered annually, and, as pointed out by the author, enormous commercial interests are now largely dependent on the protection afforded by such registration. The subject is therefore of extreme practical importance, and a guide such as the present should prove of very great value to persons interested in the matters of which it treats.

Correspondence.

Founders of the Society.

Sir,—The President, during his recent comprehensive address, intimated that there might be certain members who are entitled to be considered "founders" of the Society whose names do not appear on the list; furthermore, the President suggested that the Secretary would be glad to know of any such instances. Thereupon I addressed that gentleman, but was informed by him that he had not having joined the Society until 1842 (the year previous to incorporation), I am excused. I have a claim to be included among the founders of a very important branch at Manchester, where, associated with a few earnest workers, we laboured with patience and perseverance to secure advantages now enjoyed not only by the profession, but by society at large.

It was, sir, I assure you, up-hill work, having to contend with the old well-to-do druggist and his self-sufficiency, the apathy of middle age, and the careless indifference of the young. We met at each other's houses, collated facts, discussed trade interests and improvements in pharmacy, particularly regarding the genuineness or otherwise of drugs. You will not, I hope, think that the number of those pioneers are mentioned, especially as they have nearly all gone over to the great majority.—James Woolley, Thomas Standing, J. Robertson, W. D. Lynch, Robert Jackson, Wm. S. Brown, Joseph J. Pyne.

The only two survivors are Mr. Wm. Wilkinson (for many years local secretary) and your present correspondent now in his seventy-seventh year. I cannot recall the memory of those early days without a glow of satisfaction, for the labour was not in vain, the only emulation we had was to succeed in our object; in pursuance of which a room was hired, books supplied, lectures delivered on chemistry and botany. In a short time the craft began to perceive that the few cultivated members commanded not merely the confidence of the medical profession, but that it tended to place the pharmacists in a better position regarding business; so in order to participate in the advantage many became converted to the innovation.

We invited Jacob Bell to visit Manchester, and the claims of the Pharmaceutical Society became better known and respected. A meeting (reported in the Ph. J., vol. xii. p. 115, July 30, 1852) was convened at the library of the Athenaeum; it was attended by probably 500, a group seldom assembled; they came from remote parts of Lancashire, Cheshire, and the borders of Yorkshire—the town was not so well represented as was expected. The vernacular of Owd'lam, Ronchus, Bullock's Smithy, Chow Bent, Tilsley Bangs (Tillsdale Bank) evidently touched the humour of our apostle, who replied to their intended jokes with such good-natured sang froid that all were pleased—joining heartily in the vote of thanks to Mr. Bell by acclamation. After the meeting we adjourned to the Queen's Hotel for luncheon—in every respect a very enjoyable repast, then a quiet smoke. Conversation turned on the injurious effects of phoeborus on the workpeople employed in match making. Learning that several cases had been admitted to the Royal Infirmary, Mr. Bell expressed a wish to investigate what he felt to be a grievous wrong. And much did he commiserate the suffering sufferers, expressing hope that something might be done to obviate the evil. It is remarkable that the most extensive manufacturers of matches in this country, Messrs. Bell and Black and Bryant and May, are members of the Society of Friends. Happily we have not heard much about "Phoebus Jaw" of late years.

Kingston on Thames. R. Goodwin Mummey.
Notes and News.

PHOTOGRAPHY IN NATURAL COLOURS.—Amongst the most interesting exhibits at the conversation of the Royal Society, held last week, were the photographs in natural colours, projected by means of a lantern by Dr. Joly, of Dublin. His method of working is as follows:—A sheet of glass is ruled with fine lines of transparent colours, red, green, and violet alternately, about three or four hundred to the inch. Such a screen is placed before the sensitive plate in the camera, and on development a negative bearing the image in lines is obtained. From such a negative a positive or transparency is obtained, and a similarly ruled screen being placed in contact with the transparency, the result is a photograph in natural colours. The results thus obtained are simply wonderful in their faithfulness of rendering, and the only drawback is that at present the results must be viewed as transparentes. Portraits, flowers, water colours, etc., were thus projected, and attracted considerable attention.

SOCIETY OF CHEMICAL INDUSTRY.—The annual meeting of this Society will this year be held at Leeds on July 17, 18, and 19. The council meeting takes place at the Yorkshire College on the morning of the first day, and will be followed by the general meeting. Luncheon is to be served at the College, and in the afternoon visits will be made to various workshops, factories, and electrical current-generating stations. In the evening the members are invited to a reception given by the Mayor (Ald. Gilton). The second day will be taken up in visits to various manufacturing concerns in the Leeds and Bradford districts, four or five different rounds of inspection being arranged. On the last day there will be an excursion to Wharfedale, and a smoking concert in the evening at the Priestley Club. The local treasurer is Prof. A. Smithells, B.Sc., and the local hon. secretaries, Mr. H. R. Proctor and Mr. A. C. Wright, B.A., B.Sc., all of the Yorkshire College.

PHARMACEUTICAL REPORTS.—According to the Daily News, the Pharmaceutical Society of Berlin intends to publish regularly reports on botanical, chemical, and pharmacological discoveries concerning poisons and healing plants all over the world. The reports will be published at stated times, and it is hoped by this undertaking not only to furnish individual students with information collected into a brief compass, but also to encourage further inquiries by scientific men.

THE NEW GAS FROM CLÉVESETH.—Professors Runge and Paschen do not agree with the conclusion that the new gas from cléveith is the same as solar helium, since they find the line of the new gas to be double, whereas D₂ is single, as recently confirmed by Huggins. The true helium line apparently falls between the two lines of the cléveith gas, and Huggins (Chem. News) points out that Bâloŭskiy occasionally saw a pair of dark terrestrial lines at the sides of the bright helium line, their wave-lengths agreeing to some extent with Runge's measures.

QUEER PHYSIO Indeed.—The Evening News and Post has apparently recently purchased a second-hand book of general information, and one of its junior staff seems to have taken advantage of the opportunity thus afforded him of graduating as a professor of things in general. Hence the strange outbreak on "Queer Physio" that startled the long-suffering inhabitants of the Metropolis a few days ago. With more or less accuracy, papain is described as the dried inner lining of the stomach of a calf or pig; jellys and blanc mangues are stated to be composed of the entrails of fish, coloured with the juice of insects; and the act of inhaling a draught of magnesia is said to be equivalent to swallowing building stone (dolomite). But it is not until the writer is nearing the limits of his space that he thoroughly warms to his subject. Then, however, the smearing reader learns that syrup of squil is extracted from the sea onions, and that from the sea-shore comes a very effective blood-mixture, prepared in a secret way, "by burning seaweed and distilling the resultant ash with manganese iodine combined with iodide of potass." After this brilliant effort, no one can be surprised at the information that prussic acid is used "in a mild way" to flavour sweets, or that the pure acid is such a deadly poison that, "supposing a small bottle of it were broken in the centre of a crowded theatre, only those nearest the door would escape with their lives."

COCAINE POISONING.—A case of cocaine poisoning was recently reported before the Hamburg Medical Society by Dr. Scheele. Two cubic centimetres of a 10 per cent. solution of cocaine were injected into the urethra of a young man, the subject of a urethral stricture. Some minutes afterwards cyanose, dilatation of the pupils, and profound coma came on, followed by trismus and tetanic convolution. No effect was produced by ether, camphor, or inhalation of amyl nitrite. Oxygen and artificial respiration were resorted to, and a good effect was produced by the intravenous injection of 500 grammes of sodium chloride solution. The patient was quite unconscious for two hours and a quarter, and was not perfectly conscious until three hours had elapsed, when the only symptom was a slight right facial paresis, this disappeared the next day.

FIVE CASES OF POISONING WITH AMINITURITED HYDROGEN.—In a recent number of the Medical Chronicle, Drs. Mann and Clegg record five cases of this unusual form of poisoning arising from the use of hydrochloric acid containing a large amount of arsenic in the production of zinc chloride in an industrial operation. Of the five cases two ended fatally.

THE DENSITY OF HELIUM.—Professor Clive announces that M. Langlet has determined the density of helium extracted from cléveith as 0.139 (air = 1), or 2:03 (hydrogen = 1), this being decidedly lower than the density found by Professor Ramsay. The editor of the Chemical News observes, however, that Professor Ramsay has recently obtained helium from brügerite, of as low a density as 2.18.
THE SPECTROSCOPE AND PHOTOGRAPHY.—Dr. Huggins, in his recent lectures at the Royal Institution paid a high compliment to photography as applied to the study of star spectra, and described in detail Professor Keeler's discovery of the non-continuous character of Saturn's rings, which was determined by examining negatives obtained in the spectro-scope. These showed the displacement of the lines due to the motion of the small bodies composing the rings. Professor Norman Lockyer also exhibited at the Royal Society's Conversations negatives of starspectra, which exhibited the now famous helium and argon lines.

WALNUT SHELLS FOR CINNAMON.—Dyer and Gilbard, in a paper published in the Analyst, refer to a statement that a firm of confectioners abroad, which does a heavy trade in walnut, sold their walnut shells in London for more money than they gave for the whole walnut. It was alleged that the shells were ground and used for adulterating cinnamon, and that the examination of the powdered shells was therefore made with a view to their identification in case of need. As a result it is stated that the powdered walnut shells can be detected when mixed with ground cinnamon by careful examination with the microscope, and data are also given for analytical determinations.

Brasley's 'DRUGGISTS GENERAL RECEIPT BOOK.'—A tenth edition of this useful little work has just been published by Messrs. J. and A. Churchill, and contains a large amount of new matter, more especially in connection with the articles on Urinary Analysis, Photography, Microscopic Formule, etc. The book is an old favourite with chemists and druggists, and in its revised form is likely to be as popular as ever. This edition contains five hundred and thirty-eight pages, and is published at 6s. 6d.

PRESENTATION TO MR. A. E. FLETCHER.—An interesting event took place on the 31st ult. in connection with the retirement of Mr. Alfred E. Fletcher, F.I.C., from the Chief Inspectorship of Alkali, etc., Works, a post which he had held for eleven years. Mr. Fletcher was one of the original inspectors appointed under the first Alkali Act of 1863, being the only one remaining in office of the original five officials then appointed. Mr. Fletcher was entertained by the staff at dinner at the Hotel Privatini, when presentation was made to him by his late colleagues of a silver Monteith bowl with a suitable inscription. Mr. R. Forbes Carpenter, F.I.C., has been appointed by the Local Government Board to succeed Mr. Fletcher as Chief Inspector. Mr. Carpenter has been in charge of the East Lancashire and Yorkshire District.

POISONING BY CARBOLIC ACID.—Suicide by drinking carbolic acid appears to be greatly on the increase at present. Every week the Journal records such cases, and it is stated that within the last fortnight the Manchester deputy coroner has held inquests on no fewer than seven persons who had committed suicide by taking carbolic acid. Since the beginning of the year about twenty similar cases have occurred in the Manchester district, so that the record for the past fortnight is distinctly abnormal.

Parliamentary News.

SALE OF FOOD AND DRUGS ACT.—Evidence was given before the Select Committee of the House of Commons on food products and adulteration, on Tuesday last, by Mr. R. A. Robinson, Chemist and Druggist, as Chairman of the Special Purposes Committee of the Vestry of St. Mary Abbots, Kensington, who stated that the vestry had always appreciated the importance of an adequate application of the provisions of the Act relating to adulteration, and had also had due regard to the advantage of securing the services of a Fellow of the Institute of Chemistry as analyst. It was considered desirable to amend the Acts so as to bring manufacturers and wholesale dealers within their scope. At a conference held last year at which the vestry was represented, resolutions were passed urging that the powers of inspectors under the Acts should be extended, that retailers who could prove they had sold articles exactly as supplied to them should be exempted from penalties, whilst the manufacturer or wholesale dealer should be liable to be summarily convicted; that the labels on articles should describe the contents of the package and state the proportions if a mixture, except in the case of compounded drugs; and that a Board of Reference should have power to vary the standards for milk and similar products during exceptional seasons. All imported food-stuffs and drugs should be examined and analysed by officers of the Sanitary Authority; and there should be a minimum penalty of 40s. for all offences under the Acts, with liability to a double penalty and imprisonment for subsequent offences. The Kensington Vestry concurred in the views expressed in these resolutions, and whilst not in any way desiring to question the competency or impartiality of the Somerset House authorities, was strongly of opinion that the Board of Reference should possess the confidence of public analysts and of the general public. It was proposed, therefore, that the Board of Reference should consist of an officer of the Inland Revenue, and nominees of the General Medical Council, the Society of Public Analysts, the Pharmaceutical Society, and the Board of Agriculture. Under the direction of the Local Government Board the new authority should set forth definitions and fix standards of standards of purity and purity, besides laying down general rules for the administration of the Acts.

Mr. Robinson further suggested for the consideration of the Committee that, in addition to articles used for food and drink, any article intended to enter, or be used in the preparation of human food, should be included in the application of the Acts.

THE INVISIBLE SPECTRUM.—Dr. Huggins, in concluding his spectroscopic lectures at the Royal Institution, alluded to the wonderful advances recently made in ascertaining the character of the invisible portion of the solar spectrum. The rays of the sun when received through the prism of the spectroscope appear to the eye as a ribbon of rainbow coloured light, across which are drawn a multitude of fine black lines representing the screening or absorp-
tive effect of the solar atmosphere. From the character and position of these lines, the spectroscopic chemist is able to say what chemical elements in the gaseous atmosphere of the sun are causing this absorption. But this visible portion of the spectrum compasses but a very small fraction of the whole—a strip of thin lines that are shooting out from the great fountain of energy upon which the life of the earth and its fellow planets depends. Beyond the violet end of the spectrum there is a whole gamut of invisible rays which only revealed themselves by their effect in promoting chemical action. Similarly beyond the red end of the visible—the ultra-red—there is a gamut of invisible or dark rays which are only perceived by their heating effects.

Some idea of the importance of the "ultra-red" may be gathered from the fact that it has been traced to a distance nearly ten times as long as the whole range of the visible or light-giving portion of the spectrum. To learn the character of these mysterious dark rays, then, it is clearly necessary for science to fit itself with some new sort of eyes that can see what ordinary eyes cannot—namely, heat rays and chemical rays. The photographic plate has answered admirably as an eye for heat and brought out some wonderful facts. But with the invisible heat rays the problem was more difficult. Something in the nature of an extremely delicate thermometer is here required which will pick out all the fine absorption lines as colder spots in the spectrum. The beautiful instrument known as the bolometer has recently been used by Professor Langley in feeling for these absorption lines, which being regions from which the rays are stopped out are, of course, colder than the remainder of the spectrum. This bolometer, like all the finest applications of science, is an extremely simple thing. It is a strip of fine wire, through which a feeble current of electricity is always flowing. This wire is slowly passed along the invisible gamut of the spectrum, and as soon as it comes to one of the absorption lines the spot is shown by a minute fall of temperature in the wire. This has an instantaneous effect on the flow of the electrical current. More current flows through a cool wire than a warmer one, and the alteration is promptly shown by a delicate mirror galvanometer, which flashes its mimic signals on to a slowly revolving photographic ribbon. In this way Professor Langley has been able to pick out and locate hundred-thousandth parts in the great invisible spectrum which lies beyond the red. Not only is the absorption of rays by the solar atmosphere shown by this method, but the absorption lines of the earth's atmosphere are equally apparent.

Dr. Huggins anticipates that the meteorologist will soon be applying the system to weather forecasts. Some final remarks of the lecture in regard to the photography of the corona of the sun are of interest as indicating the enormous energy which is at work in the solar furnaces. He stated that flarv sprays of calcium vapour have been photographed extending in fantastic shapes to a distance of 280,000 miles from the sun's surface, and travelling outwards at a speed of something like 30,000 to 40,000 miles an hour.

Scotch News.

A COD-LIVER OIL EMULSION CASE.—In the Edinburgh Sheriff Court, on Monday, Sheriff Rutherford heard proof in an action by David Middleton, chemist and druggist, 56, Bruntsfield Place, Edinburgh, against James M. Wilson and Co., chemists, 16, Lothian Street, Edinburgh, and Patrick W. Wilson, chemist, the sole partner of the firm. Plaintiff sued for $50 in name of damages and also to have the defendant interdicted by himself, or by others acting on his behalf, from dispensing prescrptions containing, as part of the contents thereof, cod-liver oil emulsion, to Miss Middleton's, and representing it as his emulsion. The defendants denied that they had dispensed in any prescription a cod-liver oil emulsion which was not the plaintiff's, representing it as his, and stated that on the occasion libelled they told the party to whom the emulsion was supplied that they had not Middleton's, and obtained sanction to substitute their own.

David Middleton, the plaintiff, in his evidence stated that he had been connected with the Pharmaceutical Society since 1878, and that he had been connected with the trade for twenty years. Nearly every chemist had adopted emulsion with Willie's, and they endeavoured to find favour with them with the medical profession, with a view to their being prescribed by them. It was an every-day occurrence for chemists to dispense preparations prepared by other chemists, and if they had not got it in stock they supplied it. In such a case the patient had to wait for it till it was procured. Cod-liver oil emulsion was not in the B.P., and each chemist prepared it in his own particular way. Witness had bestowed some time and attention in preparing such an emulsion, and several doctors in his vicinity had prescribed it, and he had dispensed it himself, and supplied it for the same purpose. He mentioned five Edinburgh chemists and the Scottish Drug Depot as having got supplies, and he had had orders from Glasgow and the South of England. On March 30, last, Dr. Velch came into his shop and handed him two bottles, and asked if they contained his emulsion. Witness believed that he had suspected that the sale of his emulsion was suffering from cases of substitution, but he did not suspect the defendants. The bottles bore the defendants' labels. Witness stated that the emulsion was not his. He did not know the defendants personally, but he had come to the conclusion that they had a special preparation of their own. Dr. Velch said he had prescribed witness's emulsion, and that the preparation in the bottles had been supplied. He seemed to be annoyed. Dr. Velch and he went to the defendants' shop and saw Mr. Patrick Wilson. Dr. Velch showed the defendants the emulsions and the bottles, and asked if that was Middleton's cod-liver oil emulsion. Defendant said it was not Middleton's, that the preparation was handed in late in the evening, and that as he had not Middleton's emulsion, and as Middleton's shut at 8 o'clock, he told the boy that he would send for his own emulsion. Witness broke in and said he was Middleton, and that his shop did not shut till half-past eight. Witness then said to the defendant that if he apologised to Dr. Velch and himself and sent fresh bottles of the emulsion to the patients there would be no more about it. The defendant agreed, but ultimately agreed to Dr. Velch's method of proceeding, along with an order for witness's emulsion, to enable him to dispense the prescriptions properly. The order came, but there was no apology sent on that afternoon or since, and he gave the matter into the hands of his solicitor. A chemist was not allowed to make substitution of one ingredient for another in a prescription without the authority of the doctor. Shows an
entry in defendants' prescription book, witness said it corresponded with Dr. Veitch's prescription, and there was also along with it the words "give Wilson's." Shown another prescription in defendants' prescription book, it was for Ball's lemon-emulsion, a litre for sale for $1. Dr. Veitch knew the ingredients of it. He thought it quite fair that other chemists should have to go to him for his emulsion if it was prescribed. He was not aware that it used to be the custom for a doctor to prescribe ingredients of a particular medicine instead of prescribing it by name. The consent of the doctor must be obtained before a prescription could be altered. The chemist should follow the prescription to the letter. He would not consult the customer in a matter of changing a prescription. If he wished to change it he must communicate with the doctor. It was a discretion point whether it was the doctor or the customer that was asking for the medicine prescribed. When Dr. Veitch told him about the case he did not express himself as dissatisfied with the condition of the patient. He could not estimate the damage by substitution, but since he took proceedings his sales had gone up considerably.

The Sheriff: It had been a good advertisement.

Cross-examination continued: Dr. Veitch had no interest whatever in this emulsion, pecuniary or otherwise. It was unknown in Edinburgh for chemists and doctors to have an arrangement for the sale of special preparations. He did not know what was done in the provinces.

Dr. Alex. Veitch said he qualified as a medical practitioner in 1898. He was acquainted with the plaintiff's emulsion.

By the Sheriff: Chemists submitted their own pre- parations to medical men with a view to their prescribing them to their patients.

Examination continued: Witness had tried this emulsion and found that it had beneficial results, and he had heard other medical men speak of it in terms of approval. He prescribed it for a patient in March last who was recovering from influenza, and later for another patient in the same house. Witness corroborated the plaintiff's version of the interview with the defendant.

Cross-examined: It was perfectly fair for a doctor to prescribe a remedy, although it might be little known, and there was no difficulty in the chemist complying with the prescription. If he were to write out the formula instead of the name of the special preparation he would have no guarantee that the person would get fresh cod-liver oil. Middleton having brought out an admirable formula, he thought it only right and fair that he should have the benefit of his skill. Doctors had no quid pro quo for advertising special preparations.

Mrs. Scott deposed to having taken the prescription for her sister's medicine when it was first made out by Dr. Veitch to the defendants. She went late in the afternoon or evening for it. She was told by the chemist that it would be sent round—that it was a special thing. She asked the gentleman what was in it, and he said it would not do to tell tales out of school. He did not say anything about not having Middleton's emulsion, or that he would substitute his own. The bottle was re-filled, but she did not remember whether she got it herself or not. When the bottle broke, Charles Seggie, was ordered the emulsion sent a boy for it.

Iza. Duncan and Chas. Seggie, the patients, gave corroborative evidence.

James Steen, who was sent for the emulsion for Seggie, said the druggist did not say anything about not having Middleton's emulsion.

Peter Bos, George Street, had Edinburgh, said he was a member of the Pharmaceutical Society, Chairman of the Edinburgh District Chemists' Association, and a member of the Board of Examiners for the Pharmaceutical Society of Great Britain. He gave evidence as to the custom of the trade in dispensing specific medicines. The chemist had to conform strictly to the prescription, and he had no discretion in altering it. If they had not the special preparation in stock they sent out for it. It was quite a common thing to have to send to London for such preparations. The idea of recommending one's own preparation instead of one which they had not in stock was not to be entertained at all. He had a preparation, an emulsion, which was in frequent requisition, and he had regulations for others, and he supplied the special preparation in every case.

Cross-examined: He did not think it was the general custom to sell one's own preparation instead of another's. He would think it a shady practice for a chemist to sell his own fruit-salt, say, for any other fruit-salt. There might be a great deal of difference between an emulsion produced by one manufacturer and another. He would decline to be a party to substitution without consulting the prescriber. In regard to distilled water, a chemist might have some discretion.

John Alex. Forrest, chemist, Broughton Place, gave corroborative evidence as to the custom of the trade.

Mr. R. H. Wood, plaintiff's agent, produced letters to show that every means had been employed to endeavour to obtain an apology from the defendants before bringing the case, and this closed the plaintiff's evidence.

Mr. G. H. Laird, chemist, Queensberry Street, was the first witness for the defence. He said he had been twenty-seven years in practice. He never heard of Middleton's emulsion till this case came up. His evidence as to the custom in the trade was similar to that of Messrs. Bos and Forrest. He would not take it upon him to alter a doctor's prescription, but if a customer came in and asked for a particular preparation and he had not got it in stock, he would feel quite justified in offering one of his own if he had it. If he got a prescription for cod-liver oil he would be responsible to the doctor and the patient for Middleton's emulsion being supplied.

Mr. Heron, a partner of Messrs. Duncan and Flockhart, said he had been thirty-eight years in practice as a chemist. He was held as concurred with Mr. Laird's evidence.

The case was then adjourned till Wednesday, when the last witness will be called.

The taking of proof was resumed on Wednesday, June 19, when Patrick W. Wilson, the defendant, said he was 24 years of age, and assisted in the chemist and druggist business at 16, Leven Street. The emulsion had been carried on by his father, and he produced his father's testamentary deed, which was confirmed by his mother. He always kept a qualified assistant in the shop. He was not qualified himself. He received a salary from his mother. He remembered seeing the gentleman. He asked the gentleman what was in it, and he said it would not do to tell tales out of school. He did not say anything about not having Middleton's emulsion, or that he would substitute his own. The bottle was re-filled, but she did not remember whether she got it herself or not. When the bottle broke, Charles Seggie, was ordered the emulsion sent a boy for it.

Iza. Duncan and Chas. Seggie, the patients, gave corroborative evidence.
so. The entry in his day book was for that date. Mrs. Scott came to get the bottle refilled on March 28, and on March 28, the boy came again for the emulsion for Mr. Seggie. He again told the boy that he did not know whose emulsion this was, and asked him if he would take the same as before. And the boy said he would. Mr. Veth and the plaintiff came into his shop. Witness told them he had never heard of Middleton's emulsion. Dr. Veth said he had no right to give any other emulsion than the one he ordered, and that he must apologize to Mr. Middleton, and send two bottles of emulsion to his patient. Witness said he was very sorry if he had displeased them in any way, and he sent the two bottles of emulsion to the patients. He did not send an apology because he did not know what he was to apologize for. In acting as he did he acted on what he understood to be the custom of chemists in regard to prescriptions for specific articles. He did not think he was acting wrongly in regard to a medicine of which he knew nothing. As a matter of fact, in the generality of cases he would not think of suggesting the substitution of one thing for another. He had other emulsions in stock which were well known, and if any of them had been asked for they would have been supplied. When the bottle was refilled he supplied the same emulsion as on the first occasion.

Cross-examined, witness said he had served an apprenticeship as a druggist, but was not a qualified chemist. There were others interested in his father's will besides his mother and himself, and they had all got their share. He knew that Mr. Middleton had a shop not far from his own. He disagreed with Mr. Laird's and Mr. Heron's evidence as to the custom of the trade. It was his custom to be very careful and very minute in dispensing prescriptions. His practice was to comply strictly with a prescription if he knew the preparation. If he did not give what was prescribed he entered in his day book that he had given something else, so that they might know what to give on another occasion. On the occasion referred to witness dispensed the emulsion because his assistant was absent. It comes to him, for the emulsion first, he called on the following day, Sunday, for a mixture. When she called for the second supply of the emulsion she asked what was composed of, and he said it would not do to sell it. He did not sell it. He did not think it necessary to tell Mrs. Scott that he had not supplied Middleton's emulsion. It was between seven and half-past nine in the evening when the boy came the second time and not during the day. It did not strike him that the emulsion was the plaintiff's. His practice in the case of a special preparation being prescribed that he did not know, was to send to the wholesale houses and ask for it, and he did not do that in this case because it was too late, and those houses would be shut. If he had known it was Mr. Middleton's he would have sent for it. He was never asked for it before, and had not been asked for it since.

His Lordship then heard counsel on the evidence and reserved judgment.—Counsel for plaintiff, Mr. Wilton; agent, R. H. Wood, S.S.C.—Counsel for defendant, Mr. Craig; agent, Peter Campbell, S.S.C.

**Irish News.**

**Illegal Sale of Ether.**—At the petty sessions at Cookstown on June 14, a grocer named John Early was charged with the sale of sulphuric ether, he not being a registered druggist, and on a second summons with selling ether without a label. Sulphuric ether was scheduled as a poison some years ago, owing to its extensive use as an intoxicant. The defendant was fined £2 and costs.

**Proceedings under the Pharmacy Act.**

The adjourned hearing of the case of the Pharmaceutical Society v. Hills came before his Honour Judge Bacon, at the Bloomsbury County Court, on Thursday last. The case was last before the court on May 23, when it was stated that Mrs. Lavinia Hills carried on business at 91, Lower Marsh, Lambeth. The offence under the Pharmacy Act for which the Society sought to recover one penalty of £5 was the sale of a bottle of Powell's balsam of aniseed on February 25, at the defendant's shop, she not being a qualified person under the Act.

Mr. Gray ( instructing Messrs. Flux and Co.) said the case stood adjourned until the present date in order to give the defendant an opportunity of proving that her late husband was a registered chemist and druggist. The other facts of the case were admitted.

Mrs. Lavinia Hills, in reply to his Honour, said her husband had been in business for thirty years, but she could not say that he was a qualified chemist.

A man rose at the back of the court and stated that he managed the defendant's business, and that he was a qualified man.

His Honour said that was not sufficient to enable a woman to carry on a business for the sale of poisons. There would be judgment for £5 and costs, and a certificate for counsel.

**Poisoning Cases and Inquests.**

*Carbolic Acid.*—Sarah Jane Walker, aged 33, poisoned her daughter aged 8, on Monday, June 10, at Leeds, by carbolic acid, and afterwards committed suicide by taking the same liquid. Mrs. Walker had suffered from mental depression.

*strychnine.*—Charles Alfred Williams, aged 21, of Notting Hill, died on Monday, June 10, in Bushy Park, from the effects of strychnine, self-administered. Verdict: "Suicide while temporarily insane."

*Carbolic Acid.*—Sarah Gibson, died on Saturday, June 8, at the Manchester Infirmary, from the effects of carbolic acid, self-administered. Verdict: "Deceased committed suicide whilst drunk."

*Carbolic Acid.*—Jane Sharping, died on Friday, June 7, in the St. Pancras district, from the effects of carbolic acid, self-administered. Verdict: "Suicide while of unsound mind."

*Carbolic Acid.*—Frank Seely, aged 31, died on Saturday, June 1, in the General Hospital, Retford, from the effects of carbolic acid, self-administered. Verdict: "Suicide whilst in an unsound state of mind."

*Landanum.*—William Bolin, aged 67, died on Tuesday, June 4, at Ramsey, from the effects of landanum, self-administered. Verdict: "Deceased poisoned himself by taking landanum whilst of unsound mind."

*Landanum.*—John Dakin, aged about 50, died on Wednesday, June 12, at Derby, from the effects of landanum, self-administered.

APPLICATIONS FOR PATENTS.

[From the Illustrated Official Journal (Patents).]

No. 10,168.—Improvements in and relating to means for carrying and exposing sensitive photographic dry plates, films, and the like. May 23.

No. 10,219.—Improved traps. May 22.

No. 10,227.—An improved surgical truss. May 22.

No. 10,254.—Improvements in sulphur tablets and the like. May 24.

No. 10,297.—Improved device for extracting orks from bottles. May 24.

No. 10,329.—Stopper for glass and other bottles. May 27.

No. 10,412.—An improved air-tight cover for jars, bottles, and the like. May 27.

No. 10,528.—Combination tooth-brush and holder. May 28.

No. 10,657.—Improvements in compounds for use in pyrotechny and photography. May 29.

No. 10,695.—An improved scrubber for laboratory vessels, applicable also for other purposes. May 29.

No. 10,662.—Improvements in the manufacture of striping films for photographic purposes. May 29.

No. 10,690.—Improvements in leg-guards, gloves, abdominal, etc., protectors. May 30.

No. 10,779.—A method of developing and fixing photographic negatives or prints by means of rollers, cylinders, or pads. May 30.

No. 10,939.—Improvements in staves for medical thermometers. June 1.

No. 11,041.—Improved spray-producing device. June 4.

No. 11,079.—Improvements in bottle stands, frames, or cases. June 5.

No. 11,083.—Improved filter apparatus for filtering oils and the like. June 5.

No. 11,099.—Improved bystanelo pad and belt for women. June 5.

No. 11,108.—The patent medicinal biscuits or friends of health. June 5.

No. 11,215.—A new or improved device for maintaining the level of liquid in vessels and for measuring or delivering measured quantities thereof. June 7.

No. 11,230.—An improvement in pots for making infusions and decoctions. June 7.

PATENTS PUBLISHED JUNE 1.

Purifying cotton-seed oil (Aspinall, F. B.).—The warm crude oil is agitated with a solution of common salt and, after a time, with a solution of caustic soda. When a test indicates that sufficient action has occurred, agitation is stopped, and warm or cold water is sprinkled over the top. The water carries down all colouring matters and impurities. The inventor indicates the best temperatures and strengths of reagents to be used, and states that practically no saponification need occur. No. 11,324 of 1894.

Organic Iodides for Pharmacological Use (Newton H. E. communicated from the Farbenfabriken, formerly Frederick Bayer and Co.).—Refers to the continuation of work on iodides of phenois, etc., described in patents No. 5,079 of 1893, 18,021 of 1890, and 7,027 of 1891, and relates to the preparation of new iodine compounds for use in pharmacy, by acting with iodine or substances yielding iodine, upon the hydroxy derivatives of tri-phenymethane or of its derivatives, or upon secondary aromatic amines or their derivatives. The compounds produced are strongly solid, readily soluble in alkalies and easily obtained in a state of purity. The inventor describes the preparation and properties of tri-iodide of aniline, tri-iodide of rosoilic acid, tetra-iodide of phenol, thalbain (both the yellow and white varieties), di-iodide of carbosol, di-iodide of diphenylamine, nitroso-di-iodide of di-phenylamine, and aceto-di-iodide of di-phenylamine. No. 12,987 of 1894.

Peroxyanides (Imray, O., communicated from Gerschlich and Wichmann).—An alkaline sulpho-cyanide is fused with iron as usual, but instead of treating the product at once with water to dissolve out the ferro- cyanide, as is commonly done, the inventors first extract it from the solution or air containing its usual proportion of carbonic anhydride and moistened by steam or otherwise. "The whole of the sulphur is thus liberated, and may be suitably extracted after the ferrocyanoide, etc., have been removed by lixiviation. No. 13,260 of 1894.

Clinical thermometers (Paroni, L.).—Relates to a form in which an outer glass case encloses the whole of the thermometer, except the bulb. The process of preparing the instrument from the ordinary capillary and quill tubing is fully described. No. 13,590 of 1894.

Potassium chlorate (Bayer, K. J.).—In preparing this compound by the ordinary method, about four-difths the amount of chlorine acid is used. The inventor replaces the lime ordinarily used, by zinc oxide free from iron and manganese, the bye-product (zinc chloride) being of commercial value. No. 17,978 of 1894.

Bottle stopper (Rosenfeld, J., and Mankey, S. W.).—The bottle is closed by a cap which fits over its mouth, and has an indescribable or other packing to hermetically seal it. The cap is carried by a wire stopper so secured to a pair of spring-wire arms fixed on the bottle-neck as to hold it securely until pulled aside. No. 2,000 of 1895.

Bottle stopper (Stein, E. G. H., and Foster, C.).—Relates to medicine and other bottles, and comprises an arrangement of ball valve fitted in the bottle-neck and permitting discharge of the contents while preventing the insertion of any liquid. No. 5,768 of 1895.

Purifying metals (Rechwald, A., communicated from Fried, Krupp).—The small amount of oxygen contained in iron, steel, and other metals and alloys is removed by adding, during or before the metal is poured after fusion, some metal or non-metal having a greater affinity for oxygen than has the metal treated. The injurious trace of oxygen is thus carried in the slag, and the metal is left free from any metallic materials which may be used, but prefers to use at least two metals in conjunction. He mentions as the best for steel castings, an alloy of five per cent. aluminium, ten per cent. manganese, ten per cent. silicon, and seventy-five per cent. of iron. No. 6,323 of 1896.

Ambulance (Hayward, W. G.).—A portable ambulance is described having the two side bars hinged to fold at the middle, the cross bars which connect them and are pivoted to them being also hinged to fold in the middle. Removable flexible canes or rods are supplied to support a covering. No. 6,749 of 1895.

Zitrusverdunster, J. 1).—A composition for application to burns, scalds, and general skin complaints, is prepared by mixing in a stated manner, linseed oil, lime water, turpentine, and "paraffin." The inventor does not state whether solid paraffin is intended. No. 6,887 of 1895.

For intertrigo and hemorrhoids (Blumenthal, E.).—To prevent the formation of sores from riding, etc., and to relieve hemorrhoids, pads are prepared of a shape corresponding with the space to be filled up at or near the anus, etc. The pads are treated with a composition of "hart's tallow," salicylic acid, boracic acid, and cocaine, on the parts which touch the face. The composition is preferably applied as spray while melted. No. 7289 of 1895.
New Remedies.

[Sulphanilic Acid and Sodium Sulphanilate in Cystitis. — Sulphanilic acid has previously been recommended in iodism, as it converts the nitrates formed in the saliva and nasal mucous into indolent di- and tri-salts. In the Correpondendes f. Schweiz. Arzte, 1894, No. 7, Valantin recommends this remedy further as an excellent means for removing certain symptoms of acute cystitis. The inflammation and swelling of the nostrils and the profuse discharge caused by acute cystitis are all greatly ameliorated, or will even cease altogether in a few hours through the use of sulphanilic acid. It is generally more effective in acute laryngitis and in otitis media; generally in the latter case it only relieves the pain. The influence exerted on cystitis symptoms is not lasting, so that doses of 2 to 4 grammes must be repeated every twenty-four to forty-eight hours. The remedy is best given according to the following formula: —

B. Acid. sulfanil. crystall. 10 parts.
Aque destillata 200 cc. 
Natr. bicarbonat. 8 1/2.
D. — To three tablespoonsful twice daily, or else give simply a solution of salt.
B. Sulfnat. sulphanilat. puriss. 14 parts.
Solve in
Aqua fluminal. 200 cc.
D. — Three tablespoonsful to be taken twice every day (Journ. d. Pharm., f. Els. Leth., 1895, 184).

Ethylam-Ethyl-Diamin (Lysidin). — This body was first obtained by A. W. Hofmann, in 1886, and lately Ladenburg has prepared it by another method, and recommends it for medicinal use on account of its beneficial effect in removing uric acid from the system. He calls it "Lysidin" and recommends it as a substitute for piperazin in uric acid diathesis. Lysidin is a very hygroscopic, reddish-white, crystalline substance, and has a sweet, smell resembling horehound. It is easily soluble, and has therefore been brought into the market in a 50 per cent. aqueous solution. E. Grawitz has employed lysidin in a severe case of arthritis urica which took a typically chronic course, with the result that the symptoms of the malady were favourably influenced. The medication is taken in 2-10 grammes doses of the 50 per cent. solution mixed with a glassful of ardent water. Disgusting effects on other parts of the system were not noticed even after the medicine had been taken for a long period (Journ. f. Els. Lethr., No. 5, 1896, p. 155).

Papain in Combination in Pill Form. — Writing to the Lancet of May 4, Dr. Guthrie Rankin advocates the administration of papain in the pilliform combination with iron, and gives as a typical pill for treatment in atomic dyspepsia: — Ferri sulph., papain Finkler, as gr. ij.; ext. cannab. Ind., ext. mucis vomi., as gr. 1/8; ext. rhei, gr. 1/8; ft. pill.

Thymol in the Treatment of Sensitive Dentine. — In deep-seated caries with great sensitiveness of the dentine, Dr. Kirk fills the cavity temporarily with gutta-percha, touching the mass before insertion with thymol crystals, which will, in addition to540 exerting an antiseptic action, obtund the sensitiveness of the dentine (Journ. Brit. Dent. Assoc., xvi., 296).

Notes and Queries.

[Electro-Coppering. —

[891.] The solutions for electro-coppering should be worked hot (about 130° F.) with an energetic current, and the cyanide used should not contain less than 75 per cent. real cyanide. The following solution is recommended in Wait’s "Commercial: Copper is suspended in small and profitable iron is insoluted for further information: —
Dissolve copper sulphate, 8 oas. in hot water, 1 qt. When cold add liquid ammonia (0-880), with constant stirring until precipitate at first formed becomes redisolved, then dilute solution with cold water, 1 qt. Next, add gradually solution of potassium cyanide, 14 lb., in water 2 qta., constantly stirring until blue colour disappears, when remainder may be added bodily. After resting a few hours, the clear liquid may be decanted into the depositing vessel, and is then ready for use. Copper acetate or chloride, preferably the latter, may replace the sulphate.

Dispensing Glycero-phosphates. —

[892.] The following formula is strongly recommended by Dr. Robin (Bull. Gén. de Thérap., xxxviii., 441): — Glycero-phosphate of calcium, 6 grammes; glycero-phosphates of sodium, potassium, and magnesium, of each 3 grammes; glycero-phosphate of iron, 1 gramme; tincture of Ignatia amara, 30 minims; peptin, 3 grammes; maltine, 1 gramme; tincture of kola, 10 grammes; syrup of cherries up to 200 grammes. A tablespoonful to be taken in the middle of luncheon or dinner. This syrup requires skilful preparation; it should be of a bright cherry red colour, and free from deposit. For it may be substituted the following cacths: — Glycero-phosphate of lime, 30 centigrammes; glycero-phosphates of sodium, potassium, and magnesium, each 10 centigrammes; glycero-phosphate of iron, 5 centigrammes; powdered Ignatia amara, 3 centigrammes; peptin, 16 centigrammes; maltine, 5 centigrammes. For one cachet, to be taken in the middle of luncheon or dinner. Sometimes these cachets are less readily tolerated than the syrup; they sometimes give rise to a feeling of heaviness or even of pain, which has never been met with when the syrup is used. Glycero-phosphate of iron is best given in pilliform form, thus: — glycero-phosphate of iron, from 5 to 10 centigrammes; powdered rhubarb, 5 centigrammes; extract of cinchona, 15 centigrammes. One such pill to be taken at each meal-time.

Honey of Rose. —

[893.] Tounest (Monit. de Pharm.) recommends the following preparation as not depositing crystals of grapes sugar after preparation: Fifty parts fresh dried and powdered rose leaves are extracted with 150 parts 33 per cent. alcohol. The alcohol is distilled off from the percolate until 80 parts remain in the retort. To this add 160 parts honey, 65 parts sugar, and boil up the whole (Pharm. Centr., No. 21, xxxvi., 307).

Preserving Liquids with Hydrogen Peroxide. —

[894.] Burbel (Bollet. Chim. Pharm.) recommends hydrogen peroxide for preserving wine, beer, cider, vinegar, and other liquids. Ten parts of the commercial article is mixed with 1000 parts of the liquid. Peroxide of hydrogen is recommended by the author as one of the best, handiest, and most harmless substances for preserving (Pharm. Centr., No. 21, xxxvi., p. 307).]
Notices, Letters, and Answers to Correspondents.

Communications for the current week's Journal should reach the Office, 17, Bloomsbury Square, London, W.C. addressed "editor," not later than the first post on Wednesday. Telegrams can be received on Thursday morning. Telegraphic address: "pharmaceutical journal, London."

Advertisements (except for the "exchange" column), orders for copies, and returns of damaged copies, from B. J. B. B., respecting transmission of same, should not be addressed to the Editor, or delay will be caused. See directions on editorial page.

Correspondents who wish notice to be taken of their communications must write in a middle of one side of the paper only, and should not in any way dedicate the matter with their names—of course it is necessary for publication. No notice can be taken of anonymous communications.

Drawings for illustrations should be done with pen and ink (Chinese), and consist of clean, sharp lines, without shading. They should be sent twice the desired size, so as to allow for reduction.

Names and formulae should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

"*" Queries should be addressed "editor," and will be replied to as early as possible after receipt, answers of sufficient interest being given under the heading "Notes and Queries."

Letters.

The Composition of the Atmosphere.

J. Vaughan, of 44, Strutton Ground, Westminster, writes as follows:—"Some time ago you drew attention to a suggestion that was made to the possibility that the atmosphere of our globe had at one time a more complicated composition than it has at present. The law of reversibility renders that suggestion highly probable; for the products of the destruction by fire of organic matter point to the constituents from which organic matter has been originally derived. These constituents, which are principally carbonic acid, ammonia, gas, and aqueous vapour, with others (and not free oxygen and nitrogen), must at some period in the earth's history have composed its atmosphere. It would be a very interesting speculation to trace the stages of the evolution of that atmosphere under the influence of sunlight and other terrestrial forces to its present condition; and to point out how these stages, which at first must be chemical, would be transformed to biological ones."

Anti-extreme Cutting.

Messrs. Elliman, Sons, and Co., reply to Mr. Pond's remarks in the Journal for June 14 as follows:—"We are no Don Quixotes wishing to fight windmills, and addressed our letter to manufacturers who are aiming at the same object as ourselves, and to some others who may have concluded that perhaps, after all, there is some good in the anti-extreme cutting movement. It is not our mission to remedy the evils of the drug trade, but we do consider it to be wise to endeavor to secure a reasonable profit both to the wholesale and retail firms that distribute Elliman's."

Revision of the B.P.

"Patient" says: "The grand matter that is agitating the mind, pharmaceutical and medical, is the revision of the British Pharmacopoeia. Now it has been brought to light that medical men ignore it almost entirely, and prefer Squire or Martindale to the work issued by the Medical Council. It has also been lately alleged that potent generation of that source are well up in anatomy, physiology, pathology, etc., but not in therapeutics. They are apt to recognize the disease, but do not know the remedy. I am afraid that is true. I have lately been attended by such a gentleman, who told me he only believed in about eighteen things. I told him I felt better and would take my own remedies. The chemist is the right man to make the Pharmacopoeia; he would make the best job of it."

Photography for Chemists.

Mr. Thomas Henry Livesley, Whaley Bridge, writes:—"I am much interested in the Pharmaceutical Journal supplement, especially since the articles on photography began to appear. I am hoping by adopting these suggestions applicable to my business to turn them to good account."

Answers.

H. S. Ironmonger.—The Erigeron philadelphicus was undoubtedly an escape. The plants now sent are Valeriana officinalis and Orchis maculata.

D. S. Davis.—Kola is not merely a proprietary name; nor could it with strict accuracy be described as "a curatory drug." It consists of the seeds of Sterculia seminata (Sterculiaceae), which contain caffeine, and possess stimulating and sustaining properties, much the same as coffee leaves.

S. Hardwick.—Thanks for prompt reply.

Sidney Phillips.—The most likely book for your purpose is Bittern and Bouger's 'Biographical Index of British and Irish Botanists' (Newman and Co., London), which is well up to date. The best way to obtain information concerning foreign botanists is through the medium of the scientific press. So far as living persons are concerned, you will find their names and addresses, special departments of study, etc., in 'The International Scientists' Directory' compiled and published annually by S. E. Cassino, Boston, U.S.A. In the 'Index Keswensii' you will find references to the journals where plants were first referred to under given names, and there, of course, the botanists' names would be given in full.

H. C. Giffins.—See page 1191 for the information you require.

J. Pollard.—Your advertisement has been handed to Messrs. Street Brothers, to whom it should have been addressed.

Communications, Letters, etc., have been received from Messrs. Allen, Clarke, Harvie, Hill, Krosbie, Lewis, Long, Mumbray, Phillips, Powell, Robinson, Sutton.

Obituary.

Elliott.—On June 9, George Elliott, Chemist and Druggist, late of Walsall. (Aged 65.) Mr. Elliott had been a member of the Pharmaceutical Society since 1869.

Grimes.—On June 16, Thomas Grimes, Chemist and Druggist, Darwen. (Aged 80.) Mr. Grimes had been a member of the Pharmaceutical Society since 1872.

Thomson.—On June 17, Edward Thomson, Chemist and Druggist, Leeds. (Aged 83.)

Publications Received.

[Publishers are requested to state the price of books sent for review.]

The Imperial Trade Review for May. From the Publishers.
of the strips should be six inches or more, and cross pieces out from similar strips will then complete the squares. All the strips should be slightly oiled, and when the wet mixture is poured in the pot should be smoothed with a straight edge of wood. When set the blocks are removed, and heated for a day or two in an air chamber at 100° to 120°, to free them from hygroscopic moisture. In use the filtering paper containing the wet precipitate is placed on the smooth side of the block (Journ. Am. Chem. Soc., xvii., 472).

Citric Acid. A short time ago, E. Maunené from the University of potassium permanganate solution to solution of sugar resulted in the formation of manganese sesquioxide or protoxide and hexanic acid, $C_6H_5O_7$, Dr. T. L. Thipson now reports as having to have prepared to have prepared by the action of permanganic acid. The solution of sugar was acidulated with a few drops of sulphuric acid, and a strong solution of potassium permanganate added. In a short time the solution became transparent and colourless. Neutralised with ammonia, and calcium chloride added, no precipitate was formed until the liquid was boiled, and the precipitate then obtained was soluble in acetic acid. On decomposing the calcium precipitate with sulphuric acid and evaporating the solution, small but well-formed crystals appeared, which corresponded in shape and properties to those of pure citric acid. Excess of permanganate resulted in the formation of oxalic acid in addition (Chem. News, lxxvi., 396).

Helenium. J. Bredt and W. Post find that the formula of helenium is $C_6H_2O_3$; it possesses a neutral reaction, and dissolves in warm alkaline solutions, being simultaneously converted into the salt of an oxy-acid. The oxo-acid is completely reverted into the lactone by heating to the melting point, or partially, by warming with water; if to the latter a mineral acid is added, the lactone immediately separates. The authors have also investigated several derivatives of alantolactone or helenium (Lieb. Ann. and Chem. Zeitung, xix., 163).

Crystalized in crystals by melting the neutral sulphate of cinchonine at 130° C. and purifying the cinchonine by repeated crystallisation from water in the form of oxalate. The solution of oxalate was treated with potash and the free base extracted by means of ether. The ethereal solution was then concentrated by boiling on a water bath in a current of dry hydrogen, and the syrupy liquid produced, when cooled rapidly with methyl chloride, was converted in a few hours' time into a mass of prismatic crystals. The composition attributed to the crystals is $C_19H_22N_2O_2$. They are anhydrous, of a pale amber colour, melt at 49°–50°, and their rotary power is $[\alpha]_D = +48°$–25 in absolute alcohol (1 per cent. solution), or $[\alpha]_D = +26°$–75 in water acidulated with hydrochloric acid. Though soluble in benzine, toluene, acetone, chloroform, and alcohol, cinchonine has so far been crystallised from its solutions in these liquids. The solubility in ether increases in proportion to the freedom of the liquid from water. The chloro-zincate, chloro-cadmiate, chloromethydate, iodo-methydate, and bromo-ethylate of cinchonine have also been obtained in crystalline form (Comp. rend., cxx., 1170).
Potassium Platinochloride. A. L. Winton, in a lengthy paper on some conditions affecting the accuracy of the determination of potash as potassium platinochloride, states that the error occasioned by the presence of water in the precipitate can be greatly reduced, and the process of drying simplified, by adding the platinum solution to a dilute solution of the potash salt (one part potassium chloride or six-tenths of a part potassium oxide to 100 C.C. of water) and drying the potassium platinochloride at 100° C. The granular crystals thus obtained, though not perfectly dry, are as free from water as the usual pulverulent precipitate is after being heated at 150° C. for many hours. In some comparative experiments platinic chloride was added: (1) to a concentrated solution of potassium chloride, from which a large part of the potassium platinochloride was precipitated at once in a pulverulent form and the remainder deposited on evaporation; (2) to a solution of the potash salt, which was so dilute that no precipitate was formed and the platinochloride was only obtained on evaporation. The radiating crystals constituting the pulverulent precipitate in the first experiment enclosed much mother-liquor, in consequence of which the double salt dried slowly at 100°, lost more moisture when further heated for many hours at 150°, and still more at 160°. In the second case, however, the octahedrons formed were comparatively free from cavities and yielded practically the same results after drying for three hours at 100° (Journ. Am. Chem. Soc., xvii., 463).

Reduction of Nitric Oxide by Metals. In the course of Priestley's experiments on gases, he found that when a large surface of iron was exposed in a vessel containing nitric oxide and moisture the gas was gradually reduced to nitrous oxide. A certain proportion of ammonia is also formed in this experiment, and the same effects are produced when the iron is replaced by zinc. P. Sabatier and J. B. Senderens have now investigated the conditions under which these reactions take place. They found in one experiment that, in the presence of zinc and water, the volume of gas gradually diminished until it equalled only 36 per cent. of the volume of nitric oxide originally taken, but it then began to increase by the disengagement of hydrogen. Three-tenths of the gas consisted of unaltered nitric oxide, and the remainder contained 26 per cent. of nitrous oxide, 70 of nitric oxide, and 3 per cent. of hydrogen. Subsequently, the volume of both oxides of nitrogen diminished, until, on the nineteenth day, the residual gas, which was proved to be combustible, consisted of 62 per cent. of nitrogen and 38 of hydrogen, whilst the water in the flask employed contained ammonia. Nitric oxide kept over mercury in the presence of iron and water was not entirely decomposed until the seventeenth day, when the residual gas consisted of 61 per cent. of nitrous oxide, 36 of nitrogen, and 3 of hydrogen. It was clear that nitrous oxide and nitrogen were formed simultaneously. Next, iron was allowed to act upon solution of nitric oxide in ferrous sulphate solution. Only the first portions of gas given off contained nitric oxide, and then only in small quantity. At the end of the first hour the gas consisted of 68 per cent. of nitrous oxide, and 32 of nitrogen, no trace of hydrogen being apparent until the expiration of two hours. The nitrous oxide gradually diminished in volume, whilst the other two gases increased, until about the fifth day the nitrogen attained its maximum, 75·3 per cent. Afterwards the hydrogen increased whilst the nitrogen diminished, the proportions per 100 volumes of gas at the end of two months being 48 per cent. of nitrogen and 52 of hydrogen. The amount of ammonia formed did not exceed 0·25 Gm. per litre of liquid. Zinc acted upon nitric oxide dissolved in ferrous sulphate solution more rapidly than iron, but the results were practically the same in both cases (Comp. rend., cxx., 1158).

Cobalt Nitrate by an Indicator. Cobalt nitrate is recommended by G. C. Stone as an indicator in the volumetric determination of zinc by titration with ferrocyanide. The cobalt solution should be quite dilute, and a drop of it placed on a white porcelain plate, just touching a drop of the solution to be tested. If the drops touch but do not mix, the end reaction is marked immediately by a greenish line at the junction of the two. The best strength of the ferrocyanide solution was found to be about 30 Gm. per litre (Journ. Am. Chem. Soc., xvii., 473).

Properties of Acrystene. F. Villard finds that acrylone prepared by Moissan's process resembles carbon dioxide in becoming solidified by its own evaporation when in the liquid state, and under ordinary atmospheric pressure it is solid at 85° C., its fusing point is 81° C., and the coefficient of solubility of the gas at 0° C. under a pressure of 4·6 atmospheres is 1·6. Acrylone hydrate, CH₂=CH₂O, is formed under the same conditions as the hydrate of nitrogen protoxide, a carboxyclic acid, is denser than water, and forms crystals which are without action on polarized light (Comp. rend., cxx., 1262).

Contributions of Kaiscr. Gesundheits-Amt, Berlin, states that the ash contained in nutmegs is not more than 5 per cent., and the proportion insoluble in muriatic acid does not amount to more than one-tenth part; for incineration 2·5 Gm. of freshly-ground material was used. The loss caused by drying ranges from 9 to 13 per cent. on the better qualities. Reckoning nutmegs to contain 89 per cent. of volatile oil (according to Schimmel), the proportion of water contained in them can only amount to 5 per cent. Fat was found to the extent of from 31·1 to 40·5 per cent., and this was obtained by ether extraction in Soxhlet's apparatus. The longish nute, which appear to be preferred for nutmeg butter, showed the same quantity of fat (Phar. Wochenach., No. 19, p. 150).

Rhubarb. M. S. Ants extracts rhizin from castor cake by boiling with water, straining, evaporating to an extract, and exhausting with alcohol. The alcoholic solution leaves on evaporation a resinous residue in which crystals of rhizin can be seen. Dilute soda removes nearly all resin and fat, and the rhizin can then be crystallised from water. Shelled seeds yielded only 63 per cent.; the shells contain 15 per cent. The author was unable to obtain Turson's nitrate or chloroplatinate of rhizin. Watered on a heated with dilute soda, methyl alcohol is separated and rizacin acid formed (Ann. di chim. e farm., and Chem. Zeitung).
Salicylic Acid and Senega Root.

Rubner, having noticed that a certain sample of senega root had a distinct odour of Gualtheria, attributed this to sophistication. In reply, however, Goldener shows that under certain conditions many plants of the natural order Polygalaceae afford methyl salicylate, and that, therefore, the supposed adulterant is a natural constituent of the root (Pharm. Zeit., Jahrg. 40, No. 36, p. 300). C. Dittrichberger points out that the Swiss Pharmacopoeia has adopted the detection of salicylic acid in the ether extract of senega root as a test of identity. Methyl salicylate is a normal constituent of the root, and its detection by this test cannot be regarded as proof of fraudulent addition of oil of wintergreen, as has recently been asserted (Schweiz. Wochenschr., xxxiii., 197).

E. Speth has examined the fat extracted by petroleum spirit from different varieties of mace, and finds that Bombay mace has the properties of being different from that in other kinds of mace. The chief distinctive characters are the melting point (about 31°C), iodine number (51.3 to 53.5), Zeiss' refractometer-degrees (about 48.5), and saponification number (189'4 to 191'4). Fat from Banda mace melted at 25°C. to 26°C., yielded an iodine number varying from 78'0 to 80'4, indicated in Zeiss' refractometer 76' to 82', and gave a saponification number of 170 to 173. The above data Speth proposes to utilise for the identification of Bombay mace. This variety of mace, which is characterised by the small proportion of volatile oil it yields, is derived from Myristica malabarica, and has been frequently observed as an adulterant of genuine mace. Microscopically it can be identified by the large number of rounded cells it contains, filled with a dark yellow colouring matter (Forschungs Berichte, ii., 148).

Conine, during a microscopical examination of elder twigs and leaves, in elder. Conine which is insoluble in ether, was detected in isolating by extracting with dilute acid, precipitating bismuthic iodide of lead by sulphuric acid and separating the alkaloid by potassic bismuthic iodide. The regenerated alkaloid agreed with conine both in its chemical and physical properties. Only 0'005 per cent. could be isolated (Gazz. Chim., Ital., 1895, 25, through Pharm. Zeitung).

Alkaloids of Senecio vulgaris.

A. Grandval and H. Lajoux have obtained two alkaloids from Senecio vulgaris. The first, Senecionine, occurred in quantities varying from 0'0056 g. to 0'056 g. per 100 g. of the dried plant, according to the time of collection. It crystallises from chloroform in rhomboidal tablets, is not appreciably soluble in ether, and dissolves in alcohol at 90°C. to the extent of 0'64 per cent. at 18°C. The rotatory power of the base, which possesses a strongly alkaline reaction, is given as [α]_D = -80°-49, and its composition corresponds to the formula -C_18H_24NO_5. Senecionine, the second alkaloid, was separated from the alcoholic mother-liquors after the removal of the senecionine by evaporating to dryness, treating the residue with ether, and then dissolving in boiling alcohol acidi- lated with tartaric acid. Needle-shaped crystals with an acid reaction separated from the solution on cooling, and were found to effloresce rapidly in the air. The quantity obtained was not sufficient to determine the composition of the base, but it is described as much more bitter than senecionine, from which it also differs by being soluble in ether. The acid tartrate is slightly soluble in cold water, and more soluble in boiling water. Senecionine gives a yellowish coloration with sulphuric acid, changing to violet-tinted reddish-brown; nitric acid produces a reddish-violet coloration and a deep violet precipitate; and sulpho-vanadic acid causes a brownish-violet coloration. These colour reactions distinguish senecine from senecionine. Both bases reduce potassium ferrocyanide, and give a yellow coloration with potassium permanganate and sulphuric acid (Comp. rend., ex., 1120).

Vegetable Oils. Caffeine has isolated from coffee beans a new alkaloid, crystallising in needles, which he proposes to name caffearine. It is precipitated by potassic-bismuthic iodide after the removal of thimine by shaking with chloroform. The alkaloid is regenerated (Chemiker Zeitung, xix, 165).

E. Girard describes various cholesterins found in cryptogamic Cholesterina. plants—yeasts, moulds, and lichens. That of beer yeast crystallises from ether or chloroform in fine needles, which possess a very decided dextrorotatory power, η, = -105°. The cholesterol of Muco mucido has not been obtained in sufficient quantity to determine its physical constants, but it is stated to resemble Tamret's "ergosterin," and does also the cholesterin isolated from Lobaria pulmonacea, and the author is inclined to favour the idea that all the cholesterol existing in the lower plants belong to a special group—the cholesterol group. They are coloured red by concentrated sulphuric acid, and the subsequent addition of water causes a green precipitate, whilst animal cholesterol gives a yellowish colour with the same acid and a white precipitate on afterwards adding water. If dissolved in carbon tetrachloride and sulphuric acid (a. g. 1:76) be added, it also gives a yellow coloration, which becomes greenish when water is added with the addition of water, whilst the tetrachloride separates uncoloured. On the other hand, the ergosterins give a blood-red coloration, and the separated tetrachloride is coloured green. Again, a chloroformic solution of animal cholesterol is coloured citron yellow and red successively by the addition of benzoic anhydride and sulphuric acid. The chloroform separates with a blood-red colour which changes to violet in about twenty-four hours, and the sulphuric acid becomes brown with an intense green due to tetrachloro-der weed. Ergosterins under similar conditions become blood red, the chloroform is coloured yellowish-brown and becomes colourless in about twenty-four hours, and the sulphuric acid is brown with a faint green fluorescence. Hesse's "phytosterin" gives the same reactions as animal cholesterol (Journ. de Pharm. et de Chim. [6], 1, 601).

Vegetable Proteins. The proteids of the rye kernel soluble in water are, according to T. B. Osborne, leucosin (albumin) and proteoses. Edestin (globulin) is soluble in saline solutions, g listen in alcohol. The proteid in dilute alkalies only. The esterin and proteoses together constitute 1'76 per cent. of rye flour; gliadin, 4'0; leucosin, 0'43; and insoluble
proteid, 244; total, 863 per cent of proteins. Barley proteins are to some extent identical with those of rye, as they include leucosin and proteose soluble in water, and edestin soluble in saline solution. Haematin, a protease proteid, is soluble in dilute alcohol, and there is also an insoluble proteid present. The average percentage of edestin and proteose present in barley flour is estimated at 196; that of hordein, 40; of leucosin, 03, and of insoluble proteid, 45—total, 1076 per cent. (Journ. Am. Chem. Soc., xvii, 429 and 539).

Bohlend (Med. Chir. Rund., 1894, 628) recommends the following process:—Collect the sediment by draining off the urine as much as possible; wash with physiological salt solution (4 sodium chloride, 3 sodium carbonate, 1000 water), immerse in Muller's liquid (20 potash dichromate, 10 sodium sulphate, 1000 water.) Renew this three to four times during a fortnight. After the Muller's liquid has been removed carefully, harden with alcohol. The alcohol is renewed until it remains quite colourless. The organised parts of the urinary sediment remain unchanged, except that they appear somewhat shrunk (Med. Chir. Rund., and Pharm. Centralh., xxvii, 360).

Natural malt wine, which has attracted some attention as a nutritious and restorative, resembles in strength, sweetness, and taste, cherry, Madeira, Malaga, or Tokay, according to the manner in which it is prepared. All the varieties are clear, strongly alcoholic, and free from any unpleasant taste. As far as its origin is concerned, malt wine may be considered a beer, but in its constituents and properties it is to be regarded as a wine. It is made as follows:—Ground malt is mixed with water and carefully heated. To the liquor obtained by pressing a pure culture of the lactic acid ferment is added in order to give the necessary acidity. It is then fermented by carefully selected and cultivated wine yeast at the usual temperature. After the production of the alcohol, which can be increased by the addition of cane sugar, the wine is freed from every trace of the colour of malt by allowing it to remain for several weeks in contact with air frequently renewed. It is then racked off into barrels and allowed to ripen. The wine thus prepared contains 115 to 16 per cent. of alcohol, 11 to 25 per cent. of extractive malt, 066 to 017 per cent. of phosphoric acid, and 07 to 16 per cent. of total acid (Zeitschr. f. Krankenpf. and Pharm. Zeitung, xi, 390).

Caseneau and Haddon consider Effects of Heat on Milk that the result of numerous experiments conducted by them proves the yellow coloration of milk caused by heating to be due to oxidation of the lactose in the presence of alkaline salts. The lactose is converted into formic and other acids which coagulate the casein, the latter being unaltered except that it is coloured yellow. This is avoided at the expense of the action of the lactose (Comp. rend., cxx, 173).

E. V. Howell has investigated the Colouring Matter of Gentian, and the results obtained point to the conclusion that it may be quercitrin or one of its decomposition products. The substance is a glucoside, and a solution of its crystals has a neutral reaction. It gives a yellow precipitate with lead acetate, soluble in acetic acid; solutions of silver nitrate and gold chloride are reduced by it; with ferric chloride it assumes a dark green color; and its anammoniacal solution turns brown on exposure to air (Druggists' Circular, xxxix, 127).

Turner and Krupin, recognizing the advantages of sterilised bandages and the difficulty of obtaining them from the retail pharmacist, have investigated the sterilisation of bandages packed in closed cardboard boxes. They found that steam at 100°C. or 101°C. penetrated the box and completely sterilised the bandages, and recommend that surgical dressings so packed and sterilised should be supplied by wholesale houses to pharmacists. It appears that such sterilised dressings are supplied by a Berlin firm (D. Med. Wochen, und Pharm. Zeitung. xlii, 389).

A. Girard has conducted experiments during recent years to ascertain whether the accumulation in the soil of copper compounds used as insecticides has any ill-effect upon future crops or upon human beings and animals consuming the produce. As a result he finds that there is no apparent falling off in the crops, and a careful examination of the different vegetable products is held to establish their absolute innocuousness from a hygienic point of view (Compt. rend., cxx, 1147).

Poisoning by Ferrocyanide. Frick records a case of poisoning by ferrocyanide of potassium. A day labourer who had swallowed a quantity of the salt was found in a semi-comatose state. On complaining of thirst he was given vinegar to drink, and soon afterwards died. It would appear, therefore, that the acids present in the stomach were sufficient to liberate small quantities of hydrocyanic acid, and that the reaction was accelerated by the vinegar (Forschungs Berichte, ii, 146).

Mohr finds that the percentage of Sulphur in Keratin of Mohr finds that the percentage of sulphur in the keratin of human hair is higher than that obtained from animals. His analysis of keratins from various sources shows the following percents of sulphur:—Woman's hair, 964 per cent. sulphur; girl's, 534; boy's, 498; rabbit's, 491; calf's, 436; horse's, 536; pig's, 529; sheep's wool, 343; goose's feathers, 269 to 316; pig's hoof, 269; calf's hoof, 387; ox hoof, 34 (Public Health, vii, 389).

F. Eschbaum has directed his attention to the known differences in the size of drops of various liquid from tubes of uniform size. The factor which determines the size of the drop is the outside diameter of the tube, not the size of its aperture. Eschbaum has compiled a table showing the relative weights of drops of various medicinal agents, and recommends physicians either to make themselves familiar with such a table, or better, to use the solution by weight instead of drops; in the latter case the pharmacist could indicate on the label the number of drops to be taken. Thus, a solution containing, say, morphia, could be ordered in doses of 1 grammes; the pharmacist could direct it to be taken in an equivalent number of drops, in this instance ten (Deutsch. Med. Wochenschr. and Pharm. Centralh., xxxvi, 336).

Size of Drops.
HOLIGARNA, AND ITS BLISTERING PRINCIPLE.

By David Hooper, F. L. S.

Quinologist to the Government of Madras.

All observant forest officers in India have noticed at different times the remarkably caustic nature of the black secretion that exudes in the dry weather from various species of Holigarna. The tree is called in Malabar the black varnish tree, in contra-distinction to the yellow varnish tree, or Garcinia, which yields the gum-resin known as gamboge. The black varnish is used for waterproofing boats, furniture, and houses, and for indelibly fixing black figured patterns on linen and cotton cloths. There are other natural black varnishes obtained from anacardaceous trees growing in Burma, China, Japan, and Ceylon, and the exact character of their exudations would form the subject of an interesting research, but the present article endeavours to show the nature of the vesicating principle separated from an hitherto unexamined Indian genus.

Alluding to Holigarna longifolia, Roxb., Colonel Beddome describes it as a common tree about the Western Ghants of the Madras Presidency, from Canara to Cape Comorin, which yields a very black, acrid juice from the trunk and rind of the fruit. This is used by painters as a varnish. Mr. Gamble, in describing this large tree, says, "It gives a black acrid exudation, which raises blisters and is much dreaded by the hill people." Mr. Bourdillon, Conservator of Forests for Travancore, says of it, "The whole tree, leaves, bark, and fruit, secrete a very poisonous black juice, which raises blisters when it falls on the body. It affects some people and not others." The fruit is referred to by some writers as a medicinal agent, but its action, and the uses for which it is employed, are not stated.

There are seven known species of Holigarna, all of which are Indian. Their names and geographical distribution are thus recorded in the 'Flora of British India.'

H. arnotiana, Hook., Western Peninsula.
H. ferruginea, Marchand, W. Peninsula, Travancore.
H. longifolia, Roxb., Chittagong, Pegu.
H. helferi, Hook., Tenasserim.
H. grahamii, Hook., Western Peninsula.
H. beddomii, Hook., Western Peninsula.
H. albicans, Hook., Pegu, Martaban.

The native names applied to these trees are charei, karun-charei, cattu-tejew (Malyalam); halu-geri, kuti-geri, hool-geri (Canarees); bibu (Maharattia). Mr. Bourdillon forwarded some specimens of the fruits of Holigarna ferruginea for examination. The exudation from the stem has blisting properties, but this can only be obtained in the dry weather, about March and April.

The fruit is a drupe, ovoid or elliptic in shape, black coloured, about seven-eighths of an inch long by half an inch in diameter. The pulpy pericarp becomes thin when dry, and is of a uniform black colour, but the pulp when fresh is greenish and mucilaginous. The tests is thin and dark-brown, and encloses a whitish starchy pair of plano-convex cotyledons, with dark coloured veins running through them. The embryo is suspended from below the apex of the fruit, and the minute radicle is situated next to the hilum. In the aqueous soluble extract of the pericarps consisted of mucilage, with a small quantity of a tannic acid giving a green colour with ferric chloride. The ether and alcohol extracts of the pericarp contained the active vesicating principle of the fruit, associated with the black resinous substance forming the varnish. This principle was separated in the resin by adopting the process devised by Staeckel in examining the acrid principle of the cashew fruit. An ethereal tincture was made of the bruised pericarps, and the ether was allowed to evaporate without heat. The residue was dissolved in alcohol and treated with some freshly precipitated oxide of lead. The grey precipitate was collected on a filter, and after washing was digested in some ammonium sulphide solution. The lead sulphide was filtered off, and the filtrate was treated with dilute sulphuric acid, which separated a small quantity of oily substance. This melted at 26° and was recognised as anacardic acid. The filtrate from the grey precipitate was carefully evaporated at a low temperature, and left a yellowish coloured oily residue, which had a most irritating and acrid taste when applied in a minute quantity to the tongue, and produced a redness and soreness when rubbed on the arm. It is evident, then, that the fruit contained a body very much allied to, if not identical with, cardol, and that the constituents are very similar to those found in the marking nut.

The seeds when dry had a peculiar odour of Ceratonia pods. They contained gallic acid, 12.4 per cent. of tannic acid, 8.5 per cent. of fat, and 37 per cent. of mineral matter. A section of the seeds soaked in a drop of caustic soda turned the colour of the anastomosing veins into a bright blue, and formed a pretty object under the microscope. The alcoholic solutions of both pericarp and seeds gave a greenish colour with caustic alkalis; no doubt the principle giving this colour was contaminated with other substances which afforded red tints with soda, for when separated from the tannin it gave a blue colour. Basineer in 1881 found that the oil from the pericarps of the marking nut tree gave a green colour with potash, and Dr. Lyen in his 'Medical Jurisprudence for India' relies upon this test in detecting the presence of the marking nut in toxicological investigations. As will be seen above, Basineer's test for the marking nut would show the same result if applied to similar preparations of Holigarna.

It is interesting to notice that the properties of the Holigarinas are similar to those of two other trees of the same natural order, namely, the marking nut (Semecarpus anacardium, L.) and the cashew nut tree (Anacardium occidentale, L.), and from recent investigations by Dr. Piaff on Elaeocarpus and Azus senegal, it is not at all improbable that the chole is present in other vegetable products of the Anacardiaceae.

Soft cherries are ripened by micro-biological processes, and E. Marshal (Ann. de la Soc. belge de Micro.) states that amongst the numerous organisms concerned the chief part is played by the Oospora lactis, Bacci.
THE ETHICAL ASPECTS OF THE PHARMACY OF TO-DAY.*

BY WILLIAM STEPHENSON, M.D.

Professor of Midwifery, University of Aberdeen.

Under the prospect of a new edition of the British Pharmacopoeia, the professional mind is at present being directed to pharmacy. There are some aspects of the subject which, although connected only indirectly with the Pharmacopoeia, are yet well worthy of consideration. Recent developments are tending not only to modify the methods of prescribing, but also to affect the ethical relations of medical men to the pharmaceutical world.

Pharmacy, though now regulated by a distinct corporation, with its own organization, protected by Acts of Parliament, is still a branch of the healing art. Home rule has been granted, but not independence. Between prescriber and dispenser there is a mutual dependence and mutual obligations over which an ethical, if not legislative, power should preside.

Though now distinct from medicine as a profession, pharmacy has developed a professional status for itself, safeguarded by examinations that demand considerable scientific education and practical training. This position, however, requires strengthening and purification. As a profession pharmacy has, in its business relations, to contend with gross influences, which, for the sake of gain, are engendering practices inconsistent with all professional character. A keen commercial and speculative spirit is becoming rampant; it threatens to degrade pharmacy, and is affecting seriously the interests of those who are devoting themselves to the work in a proper professional spirit.

The enterprise shown of late by pharmaceutical chemists is to be commended so long as its aim is the improvement of pharmacy by scientific and professional means. When, however, it becomes associated with the craving for gain, and endeavours to satisfy it by the introduction of novelties that are turned into proprietary interests, when it is promoted by self-creation and misleading statements in persistent and obtrusive advertisements, then the professional spirit is enervated. Under such circumstances it behoves medical men to be on guard, lest they are enticed into betting actions that are opposed to the treasured principles and traditions of their profession.

One marked feature of the present day is the invasion by wholesale houses of the province of the dispensing chemists. Machinery is displacing hand labour, wholesale manufacture the home-made article. From the wholesale manufacturer the druggist must obtain much of his stock materials, and on his knowledge, experience, and character we must rely for the selection as to quality; but in dispensing, the preference should always be given to the freshly home-made article over the factory compounds turned out in hundreds of gross, and that may be months and years old before they are used. In the movement the spirit of personal aggrandisement can be readily detected. By a mere coating of varnish, or the use of a registered name, it is turning even the formulae of the Pharmacopoeia into proprietary preparations. If we prescribe for a patient any of the pills of the British Pharmacopoeia, or of a well-known formula have we any right, is it becoming, that we should require that they be those of one particular maker? Yet this is what the wholesale houses ask us to do, and is done by many practitioners. Would it not be more reasonable to require that the ingredients be those of certain makers than that the desired peculiarities should consist solely in the expensiveness of the coating of the pill? Chemists are now often compelled to keep in stock some half-dozen makes of an article which they themselves could freshy and as skillfully compound—all to suit varying whims and bring grist to particular mills. There are many remedies where it may be desirable to name the maker preferred, but then only as a recommendation. These are the proper factory or laboratory preparations demanding special skill and facilities; but when the prescription is of the nature of a pill, a syrup, a mixture that, the formula being known, can be compounded by any qualified druggist, it is unsound to restrict the dispensing in any way.

In the present day the art of combining remedies and of prescription writing is imperfectly acquired and little studied. Ignorance is the fruitful seed of gullibility; hence the large crop of non-official compounds of remedies, combined in unrevealed proportions and by secret processes.

The objectionable character of proprietary articles is not removed by a professed publication of the formula. Any value they possess must either be a secret or if the claim be skill and facilities in compounding, in most cases it is unsupported by such intrinsic value as to merit "exclusive dealing."

The Pharmacopoeia Committee will have some difficulty in preparing the new edition. Can it be expected to keep pace with the "new pharmacy" with its tablets, tabloids, tabelle, cachets, capsules, jeloids, hypodermics, perlas, parvules, pelasides, bialatinoids, and soloids? There is good in the "new pharmacy," but this fresh development is showing a redundancy of action, and is invaded by and proving to be a favourable medium for the cultivation of the germs of pure personal aggrandisement. There are many instances where the capsule or the tabloid is a well adapted form for the administration of a remedy, but there is a danger, under the continuous pressure of puff, and samples, of the system being carried too far. The disciples of the "new pharmacy" are shouting "Eureka!" and are discarding draughts and mixture.

An important question, however, has been raised, whether many drugs will act as efficiently when given in the dry and concentrated as in the fluid form, especially when freshly prepared. It may be difficult to prove the point as regards many medicines, but the special form in which a remedy is administered is not unimportant. It is known that the infusion of details is at times more serviceable than the tincture;

---

cafeine does not give the same results as freshly prepared coffee; and no one surely would prefer a tea tabloid to a cup of that beverage. For convenience sake, or to make the dose more palatable, we are to discard as of no importance the corrective and the adjuvant in our prescriptions.

Another marked feature of the pharmaceutical world of to-day is the extensive use of advertisements. In business this custom is legitimate and beneficial to the public, so long as it is conducted in a fair, truthful, and businesslike manner. But it is reprehensible and unbecoming when it assumes the aggressive form against rivals, and makes use of unwarranted statements dressed up in quasi-scientific garb, the truth that is half untruth—all calculated, if not intended, to deceive the public. It is to be regretted that pharmaceutical chemists are degenerating in the style of their advertisements.

The evil effect of the keen commercial speculation can be readily traced in the changes which the advertising mania is producing in infant and invalid feeding. Articles such as condensed milk, infants' food, essences and extracts of meat, all useful in their proper place, have been seized upon and made to serve the purposes of the insatiable greed of gain. Their proper use does not create sufficient demand to meet the excessive production arising out of the large sums invested in their manufacture. Hence that demand must be artificially increased. The speculative spirit conjures with the latest scientific terms and ideas, it seeks favour by fallacious quotations of chemical analysis and physiological experiment, and makes unwarranted assertions as to medical experience and opinions. Malt has "come as a boon and a blessing," not to babes alone, but to speculators too. Of the making of meat extracts there is no end. The fresh milk of the cow is discredited in every way. It must be sterilised, peptonised, "humanised," before it is fit for use. Freshly-prepared home-made articles are useless; invalids should be fed on factory-prepared meats and peptones, months and years old; and are not medical men all the country over aiding in the production of the artificial demand necessary to earn dividends to the joint stock companies limited, accepting chemical analysis as a test of digestibility, and thoroughly trusting in the permanency of the artificially-peptonised state of foods and the nutritive quality of destituted and pulverised albumin and fibrin?

It is evident that there is much in the ethical aspects of the pharmacy of to-day that concerns medical men and has important bearings on the practice of medicine. Pharmacy is undergoing considerable change, but in the midst of the healthy development there is a growth which, in excessive production and the tendency to invade all surrounding interests, is verily of the nature of a cancer. It is destroying the professional spirit in pharmacy. By means of chicanery and advertisements emulating in a refined manner the example of quacks, it is deceiving the public, and it has the effrontery to solicit the aid of medical men by asking them to be the touting agents for its goods.

THE BOTANICAL GARDENS AT BUITENZORG.
The latest report on these celebrated gardens, that for the year 1893, is divided into nine sections. The first relates to the personnel and organisation of the gardens; the second to the periodical publications connected with the gardens; the third to the herbarium and museum; the fourth to the botanical laboratory; the fifth to the culture garden and the agricultural-chemical laboratory; the sixth to the physiological laboratory; the seventh to the botanical garden and mountain garden of Tjibodae; the eighth to the office, library and photographic department; and the ninth to the investigation of the forest tree flora of Java. At the end there are three appendices, the first relating to a chemical investigation of the constituents of Java tea; the second consisting of a list of plants received, and their donors' names; and the third of a list of the plants and seeds distributed by the gardens in 1893.

It will thus be seen that a very considerable amount of work is done in these Gardens, which are probably better equipped than any other in the world, and certainly receive a State support that might beimitated with advantage by our own Government, in one, at least, of its botanic gardens in each quarter of the globe. The contributions under the first section consist of a paper on rainfall and the form of leaves, with three plates by E. Stahl; a contribution to the Malay flora by Dr. W. Burck; and an investigation of the genus Gesnium by G. Karsten.

Professor Stahl points out that the acuminate form of the leaf is particularly adapted for causing the rain to run quickly off the leaves, and that the so-called sleep of many leguminous compound leasue is adapted for the same purpose; the leaves of this kind being usually thin and unable to support a weight of water. Dr. Burck describes seventeen species of Mucuna of the Malay flora, of which seven are new, and the known species of Brythozygon, including four new species, viz., E. coarctatum, E. bauconum, E. latifolium, E. longistipulatum, of which the first two are figured.

Dr. Karsten describes fifteen species of Gesnium, of which two, G. ovalifolium and G. verrucosum, are new. These papers, although prepared during the year 1893, could not be printed until the year 1894, when they appeared in the 'Annales du Jardin Botanique de Buitenzorg.'

Another publication, 'Mededeelingen uit S'lands Plantentuin,' No. x., gives an exhaustive account of the poisonous and narcotic plants used to poison fish in all parts of the world, and forms the most complete list of these plants ever published. In 'Teyammia,' pt. iv., the Director of the Gardens published contributions on the injury done by caterpillars to aspen trees; on tanning barks and extracts of the Dutch East Indies; on the "dadap" disease in East Java, on the "bibit" disease in tobacco; and on batatas.

The tanning materials referred to are "tanggoeli," "pilang," and "kkebesak barks," Indian oak, Indian willow, Australian Acacia bark, Rhizophora bark, catechu extract, gambier, "divi-divi," and Penang nute.
In the herbarium and museum department it is interesting to note that no less than twenty-five herbarium specimens of the genus Cinnamomum were forwarded to D. Pfister, of Zurich, for examination in preparing his paper on cinnamon barks (see Ph. J. [3], xxiv., p. 941). The herbarium has also received a large number of plants as the result of an expedition ordered by the Dutch Government to investigate the flora of the Moluccas, New Guinea, Kei, Aroe Tenimber, and other islands.

In the botanical laboratory a micro-chemical investigation was undertaken by D. P. Anema, to determine the position of the alkaloids in the following species of Strychnos, viz., S. usz-romica, tincte, laurina, amelia, minor, hirsutiana, and an unknown species occurring in the gardens. This is not yet completed, and is to include an account of the occurrence of the alkaloids during the growth of the plants. In the culture garden, experiments have been made, amongst other plants, upon galangal root, and ipecacuanha. The rhizomes of the former were found on distillation with water to yield only traces of essential oil, and the latter plant was found to yield only 0.01% of dried root from thirty-three plants. Cola acuminata flowered and fruited in 1899, and Bryophyllum coca, Lam., var. spruceanus, Burck, after weeding and nursing, yielded a good crop of leaves. Of the different methods of grafting the outmug, that known by the name of "plakken," whereby branches of a female plant are grafted on young trees grown in pots, proved to be the most successful.

In the agricultural-chemical laboratory the rhizomes of Kewnigeria rotunda (which are used like redency in the East) have been distilled, and afforded about 0.2% per cent. of a volatile oil with a not unpleasant odour, and having a specific gravity of 0.868 to 0.894. Part of it distilled over between 200°, and the other, which was the larger proportion, boiled at 240°. In a tube of 200 Mm. the ray of polarised light was deviated 27° to the right. Messrs. Schimmel, to whom a specimen of the oil was sent, suggested that, judging from the odour, etc., it probably contained cineol and methyl chavicol.

The patchouli plant called "dilem," but of which the exact specific name has not yet been determined, was found to yield a volatile oil of a pleasant odour, which in one sample deposited a stearopent. It differs from ordinary patchouli oil in possessing in addition an anise-like odour. Its specific gravity is 0.901 at 15°, and it polarises to the left 32° 17' in a tube of 100 Mm.

The rhizome of Kingler sorubet afforded on distillation with water a quantity of large crystals, melting at 67°, together with a little volatile oil.

The editor points out that the Costus spectabilis stated in Schimmel's report to yield 1% per cent. of volatile oil cannot be that plant, since the true plant distilled at Buitenzorg afforded no trace of oil, and suggests, which is no doubt the correct explanation, that the root distilled by Messrs. Schimmel was that of Apolanta auriculata, which was formerly attributed to Aucklandia costus.

Some interesting experiments made on the leaves of some gutta-percha plants, viz., Palauquirum burmense and P. gutta, showed that the young leaves yielded respectively 0.5%, and 0.7% per cent. of pure white gutta, the mature leaves 4.8%, and 6.33%, and fallen leaves 8% and 8.24% per cent., showing that the P. gutta is practically the richest of the two. The larger percentage in the fallen leaves is attributed to the destructive action of the sun and rain upon the tissues. The amount of gutta-percha obtainable from 150 trees of P. gutta nine years old is estimated at 40 kilogrammes. The gutta-percha was obtained perfectly white by first treating the leaves with boiling alcohol until it runs off colourless, and then with gasoline boiling at 60° to 80°.

In the pharmacological laboratory the examination of the bitter principle of "sambodja" bark (Plumbiera aquifolica, Poir.) has been continued. It proves not to be a glucoside, and can be obtained in handsome white crystals. From Dioscorea hirta, Bl., the species used by the Malays for arrow poison (Pa. J. [3], xxiii., p. 388), two alkaloids were obtained, one volatilised by steam and having a paralyzing (hempenema) action on the nervous system, and the other not volatile and producing cramps and tetanus. They are easily decomposed, and are therefore difficult to obtain in the pure state.

A native remedy, known as "pronodjuvo," having a great reputation in diseases of the chest, has been identified as the fruit of Euchresta hirsutus, Miq. They are difficult to obtain, as they are only known to occur in one place in the mountains of Java. They have been also examined chemically, and have been found to contain a very poisonous bitter alkaloid which has a narcotic action. The seeds of another plant (Sterculia sp.) bear the same native name. These also contain a small quantity of alkaloid, but it is scarcely, if at all, poisonous.

From the leaves of Ochidium molle, Bl., which is employed as a remedy for snake bites, small traces of an alkaloid have been obtained, but nothing else to which any curative or antidotal properties could be ascribed.

In the botanic gardens, amongst the numerous plants mentioned it is noted that Mercadaria leiocarpus, Sieb. et Zucc., yields a kind of indigo.

The other sections contain but little of general interest. The first appendix gives a lengthy account of the examination of Java teas. From the analysis of the ash it appears that potash and phosphoric acid are the two most constant and important constituents, the quantity of lime, magnesia and iron appearing to vary according to the soil in which the plant grows. The scientific details given are very full and should prove of interest to tea-growers in other colonies.

The other appendices, containing lists of plants and seeds received and sent, indicate that even this branch of the work of the garden is considerable, the number of packages sent out being 73, or an average of 1.5 per week. It is noticeable, however, throughout the work that no space is wasted on correspondence given in full, all the information is digested and summarised in a businesslike manner.
The Pharmaceutical Journal

FIFTY-FOURTH YEAR OF PUBLICATION.

SATURDAY, JUNE 29, 1885.

Editorial Department.

Communications for the Editorial Department of the Journal, books for review, &c., must be addressed to the "Editor," 17, Bloomsbury Square, London, W.C.

Advertisement Department.

Advertisements and remittances must be sent to the Publishers, 6, Soke Street, Lincoln's Inn, London, W.C., where copies of the Journal may be purchased. Cheques and money orders should be made payable to "Street Brothers."

Instructions from Members, Associates, and Students respecting the transmission of the Journal must be sent to the Secretary—Mr. Richard Brumbridge,—17, Bloomsbury Square, London, W.C.

CLOSE OF THE THIRD SERIES OF THE JOURNAL.

The issue of the present number of the Pharmaceutical Journal completes the third series of this publication—extending over a period of twenty-five years—and although that circumstance might be made an opportunity for reviewing the many changes which have taken place meanwhile in regard to pharmaceutical affairs, it will be more appropriate to consider only those which directly concern the Journal itself. Hitherto—in common with the French Journal de Pharmacie et de Chimie, the German Archiv der Pharmacie and the American Journal of Pharmacy, which are still monthly publications—the Pharmaceutical Journal has been conducted mainly with the object of furnishing its readers with information as to scientific matters more or less intimately connected with the practice of pharmacy and as to the progress made in those branches of science which bear upon pharmacy. The Journal has also served as a medium of communication and for the discussion of pharmaceutical affairs, as well as to record the transactions of the Society and other proceedings affecting the business. The increase in the size of the Journal—introduced in the third series—and its more frequent publication gave opportunity for considerably extending the area covered by the subject-matter, and the contents of the twenty-five volumes may be accepted as conclusive evidence that there was no ground for the apprehension, once entertained, as to the impossibility of obtaining a continuous supply of suitable material for a weekly Journal.

But with the experience thus acquired, the idea has grown up that there is a possibility of still further increasing the utility of the Journal and making it more generally acceptable under all the various conditions affecting the conduct of a chemist's business. This view is very generally entertained, and one of its chief exponents, Mr. R. A. Robinson, some years ago gave formal expression to it at an annual meeting, by a motion requesting the Council to consider the matter. Since the time when the third series of the Journal was commenced, there has been a very large increase in its circulation, consequent upon the growth of the Society. Although the number of members of the Society is now very nearly the same as it was then, there has been a great increase in the number of associates, that being the direction in which the Society is chiefly becoming representative of the trade. While in 1870 the total number of associates was only 540, it is at the present time very nearly 3000, and to that extent the Society and the Journal are more largely identified with the general body of chemists and druggists than they were. It was with the view of still further extending connection between the trade and the Society, that the supporters of Mr. Robinson's motion advocated the adoption of a suitable change in the Journal, calculated at once to command more general interest in it, and thus to bring about increase in the membership of the Society. Within the last few months an endeavour has been made to satisfy the requirements above referred to, and it has met with such unqualified approval as to justify the expectation that the interests of pharmaceutical organisation—of which the Society is the pivot—will be materially promoted by extending the scope of the Journal in the manner suggested. In order to bring this alteration within the cognizance of every member of the trade, a copy of the first number of the new series of the Journal will be sent to every registered chemist in business in the kingdom.

Before closing this article the Editor desires to emphasise the fact that the members and associates of the Society are alike proprietors of the Pharmaceutical Journal and equally interested in its success. To assist in promoting its success should be the endeavour of all of them, not only because the Journal is their common property, but also because it may be of use in cases where the interests of the pharmaceutical body are likely to be affected by legislative action. In this respect the Editor gladly takes the opportunity of expressing his thanks for the kind assistance he has hitherto received in various ways from members and associates of the Society throughout the country, and his belief that in the future similar help will be accorded to him. Such friendly aid will then be even more necessary, acceptable, and useful; hence it will be no disparagement of the gratitude now expressed to define it as a liberal anticipation of favours to be received.
AN ANTITOXIC SERUM FOR SNAKE POISON.

The continued success of the antitoxic treatment of diphtheria has encouraged experimentation with the view of ascertaining whether the method is applicable to other forms of disease. Thus Emmrich and Scholl have applied the serum treatment to cases of cancer and sarcoma, with results which require further investigations. Tizzoni and Centanni have obtained encouraging results in the treatment of tubercle in a similar manner. The latest application of the method is interesting in the highest degree. Professor Frasher, of Edinburgh, in the British Medical Journal of June 15, communicates the results he has obtained with the serum of animals rendered immune to the poison of the cobra, rattlesnake, and other poisonous serpents, representing the most deadly of the Ophidia of Asia, America, Africa, and Australia. Through the labours of many investigators, including Kaufmann and Sir Joseph Fayrer, it has been proved that animals can be rendered proof against snake poison by the repeated administration of graded doses of the venom. Professor Frasher has confirmed their results, and has proved in addition that the blood-serum of animals thus rendered immune possesses definite antitodal properties. Experiments were made with the venom of each of the four varieties on guinea-pigs, rabbits, and other animals, and the minimum lethal dose per kilogramme of the weight of each kind of animal was ascertained. This dose was found to differ greatly in the different animals. For instance, in guinea-pigs, in the case of cobra venom, it was 0.00018 Gm., while in the cat it was somewhat less than 0.00025 Gm. Thus the author points out that the poison rivals in its lethal powers the most active vegetable principles, such as aconitine, strophanthin, or acokantherin. When the resistance of the animals had been increased by the administration of graded doses short of the minimum lethal, it was found that four or five times that amount could be given and "still the animal suffered little, and, in many cases, no appreciable injury."

The inquiry was in many cases rendered difficult by organic changes caused by the poison in the kidneys and in the blood, and also by functional disturbances. In spite of difficulties, Prof. Frasher by careful preparation succeeded in increasing the resistance of rabbits to such a degree that fifty times the minimum lethal dose could be administered subcutaneously without any obvious symptom of poisoning being manifested beyond a rise of body temperature, which lasted a few hours after the injection, accounting for a temporary fall in body-weight. During successful immunisation the animals, such as rabbits, increased in weight and showed increased vigour and liveliness. This was also seen "in an old and previously sedate horse."

The differences in the effects of the four kinds of venom were also investigated. Thus, it was found that the local action of the poison of the rattlesnake was much more marked than that of the cobra, though, in its general action the latter was sixteen times more powerful than the former. Gradual immunisation prevented both the local and the general effects of all four kinds of poison. The author was able to establish the rule that an animal protected against one form of poison was also rendered resistant to the others. As to the duration of immunity there has as yet not been sufficient time to judge, but in the case of a rabbit which at the end of the course of immunisation had received twice the lethal dose of rattlesnake poison, the same dose was repeated twenty days subsequently, and it altogether failed to produce toxic symptoms. Thus, as Professor Frasher points out, the protection lasts for a considerable time.

From the blood of immunised animals a serum was obtained which had marked antitodal properties. The serum, when dried, was found to be easily pulverisable and readily soluble. Experiments were made with the mixed serum of three rabbits, which had received last a dose of cobra poison equivalent to thirty times the minimum lethal dose. In one series of experiments a dose of cobra poison greater than the minimum lethal dose was mixed with the antitoxic serum (antivenene) in varying proportions, and it was found that so small a quantity as 0.004 C. c. per kilo of the animal's weight was enough to neutralise a deadly dose of poison, whilst 0.0025 C. c. was insufficient for the purpose. When thrice the minimum lethal dose was given, 1 C. c. per kilo of antivenene gave protection, whilst 0.8 C. c. failed to do so. Three other series of experiments were made, and in one of these it was found that 0.8 C. c. of antivenene injected thirty minutes after a minimum lethal dose gave protection. The results are detailed in a most interesting paper, which, though only an abstract, is a pattern as an account of an investigation of the highest possible importance. It will be seen that the methods are the same as those by which the new treatment of diphtheria was worked out. The importance of the research will be evident when it is remembered twenty thousand persons succumb annually to snake bites in India. With a view of testing the efficacy of the remedy in man, Prof. Frasher is preparing a large quantity of serum from a horse. No other remedy has, according to Sir Joseph Fayrer, been found to be efficacious, and since in 75 per cent. of fatal cases death does not occur until three to twenty-four hours after the infliction, there would be time in many cases for the exhibition of the remedy. Every right-minded person will wish all success to the treatment thus dis-
covered by the distinguished professor of materia medica of the University of Edinburgh, who, according to the latest intelligence, has now obtained definite proof of the antidotal properties of the blood-serum of venomous serpents. He is expected to make a further communication on the subject to the next meeting of the Royal Society of Edinburgh.

MEDICAL MEN AND THE U.S.P.

A CORRESPONDENT of the New York Medical Journal states that many members of the medical profession in the United States are unaware of the existence of the national pharmacopoeia, proprietary remedies of unknown composition having in great measure ousted official preparations in prescriptions. It is not denied that new remedies of great value have been introduced into medical practice, but it is urged that the majority of those which now flood the market and absorb the attention of many physicians are of questionable merit.

"They are introduced and extensively advertised, not for the sake of suffering humanity, but for the pecuniary gain to their enterprising originators. The result of this must necessarily be detrimental to medical practice. Whereas the physician of a generation ago was quite as familiar as the apothecary with the drugs which he prescribed, the physician of to-day is daily prescribing drugs which he himself has possibly never tasted, handled, or seen. He is, moreover, led into laying aside the old, tried, and effective remedies, and mised into using certain new ones of the nature of which he is ignorant, and of the effect of which he is uncertain."

DISCUSSION ON PHARMACY LAW.

Matter of special interest to our readers was under consideration at the meeting of the Western Chemists' Association, on June 19, when Mr. R. H. Parker re-opened the discussion on the present phase of the poisons law in an able, albeit somewhat doctrinaire manner. The weak points in his address were promptly indicated by Messrs. E. N. Butt and C. B. Allen, and an amended resolution was carried, which fairly indicates the reforms that should be aimed at, though it is doubtful if the one referred to in the second clause is feasible. Amongst the alterations suggested by Mr. Parker, the proposed division of the qualifying examination is especially undesirable, since, as Mr. Allen observed, it would be quite impossible to limit a partly-qualified assistant's privileges, if it were once admitted that he was fitted to take sole charge of a pharmacy for a limited time (see page 1209).

ROYAL SOCIETY ELECTION.

We are glad to be able to chronicle the fact that Dr. J. Reynolds Green, M.A., Professor of Botany to the Pharmaceutical Society, has been elected a Fellow of the Royal Society. The medical profession is particularly distinguished by the election of Dr. Sidney Martin, of University College Hospital, who has earned the respect of his professional brethren by his invaluable work in connection with the Royal Commission on Tuberculosis.

SPECIAL CIRCULATION OF THE JOURNAL.

Some remarks were made at the meeting of the members in Scotland of the Pharmaceutical Society, on Friday week, with respect to the circulation of the Journal amongst registered persons not connected with the Society. Our friends in Scotland seem to have overlooked the fact that the number for February 23 last was sent to everyone whose name appeared on the Register of Chemists and Druggists, whilst that for May 25 was sent to every chemist in business—in England and Wales, Scotland, and Ireland—whose address could be ascertained. Further, it has been announced for some time past that the first issue of the new series will next week be sent to the same persons, and in addition to more than five thousand other interested parties in the United Kingdom and abroad, over sixteen thousand copies being distributed in all. This is done specially to bring before the notice of pharmacists generally the changes that will henceforth mark our pages. It may not be amiss to suggest that those who now receive the Journal regularly may do much to draw attention to it in its new form, and so help it forward with renewed vitality and under the most favourable auspices.

THE NEW PHARMACY.

In a paper read before a Scottish Branch of the British Medical Association, Dr. W. Stephenson, of Aberdeen University, has drawn attention to the relations naturally existing between pharmacy and medicine, with the object of pointing out the prejudicial influence exercised by certain forms in modern pharmaceutical enterprises. He suggested that there is at the present time much in the ethical aspects of pharmacy that concerns medical men, and has important bearings on the practice of medicine. The opinions expressed are so well deserving the careful consideration of pharmacists desirous of maintaining a professional status, that we have reprinted the article at page 1198, as supporting from a medical point of view the views which have been on several occasions put forward in this Journal.

NORTH BRITISH BRANCH.

The report of the result of the latest election for members of the Executive of the North British Branch of the Pharmaceutical Society (see p. 1204) shows that a few changes have been effected in the composition of that committee. Messrs. Bowman, Coul, and Mair replacing Messrs. Kimblemont, Sutherland, and Noble, who had retired. It is satisfactory to note that Mr. Laidlaw Ewing once more heads the poll, and that, too, by a much larger number of votes than last year. This is sufficient proof, if proof were needed, that the labours of Mr. Ewing for the good of the Pharmaceutical Society are properly appreciated in Scotland.

INDEX TO THE JOURNAL.

To ensure greater accuracy in the indexes to the volumes of the Journal, it has been decided to publish them in future with the first number of each new volume. In view, however, of the fact that next week's issue, which will commence the first volume of the new series, will be circulated amongst some thousands of chemists and firms who are not at present regular subscribers, the publication of the index to the present volume will be deferred until the following week.
Transactions of the Pharmaceutical Society of Great Britain.

NORTH BRITISH BRANCH.

Election of Executive.

A meeting of members and associates in business, residing in Scotland, was held in the Society’s House, 36, York Place, Edinburgh, on Friday, June 21, at 12 noon, Mr. J. Laidlaw Ewing in the chair.

The minutes of last meeting were read and approved, and apologies for absence were received from Messrs. W. L. Currie, and Robert McAdam, Glasgow; James Fison, Edinburgh; and J. W. Sutherland, Dumfries.

The Chairman said he had again to refer with satisfaction to an increase in the number of those connected with the Society in Scotland. There were this year 363 voters as compared with 363 last year, being an increase of 14. While the movement was thus in the right direction it was perhaps a little slow. There had also been considerable interest in the election, and a larger proportion of voting papers had been returned than in any previous year. They would be acquainted with the Annual Report of the Executive to the Council, which had already appeared in the Pharmaceutical Journal of May 11, 1895, and indicated the work that had occupied the attention of the Executive during the past year. There had been a radical change in the constitution of the Board of examiners, and in connection with this change, Messrs. Nesbit and Gibson retired after many years of good service, which had earned them their highest respect and goodwill. They still, he was glad to say, would have the benefit of their experience and advice as members of Executive. An even more important change was the appointment of professorial or teaching examiners, and it was a matter of satisfaction to all Scottish pharmacists that they had secured for these positions such men as Professor Geddes and Professor Gibson. There had not been during the year any important decisions in pharmacy law in Scotland, but in England some important points had been settled in a way calculated to strengthen the hands of the Council in applying the salutary provisions of the Pharmacy Acts. By the vigilance of the Registrar also, they had been successful in frustrating several attempts to evade the Pharmacy Act by means of the Patent Office, and it was clear that the days of patented poisonous nostrums were about numbered.

Last year he had ventured to call special attention to the relationship of Scotland to the Benevolent Fund, and pointed out by comparison that there was much room for improvement. He regretted to say that as yet the returns did not indicate much practical result; indeed, in some cases there seemed to be rather a decrease. During the year there had been several grants to Scottish applicants, and in one recent case in Edinburgh the Council had shown their generosity. He hoped these instances might be the means of inducing some to subscribe who had not hitherto done so. With regard to the personal of the Executive, there were one or two changes. Mr. Kinnimont, who had long acted as a representative of Glasgow on the Executive, now retired, and they all wished him much comfort and happiness in his well-earned retirement. He was glad to know that they were to have the services of another gentleman who came from the same district of Glasgow. Owing to a feeling, which was now very general, that examiners should not be also members of Executive, Mr. Sutherland, of Dumfries, also retired. Hitherto they had been able to secure another representative from the southern district of Scotland, and he hoped that by another year they might be able to do so. Mr. Noble also retired, but they would now have the services of two new local men.

Their obituary for the past year was fortunately a short one. He might mention the late Mr. Seath, of Dunfermline, who was an early member of the Society in Scotland; he had been for some years a member of the old Council of the North British Branch, and up till the time of his death acted as local secretary to the Society. He was a very genial man and greatly beloved and respected by all who knew him. A few weeks ago also they had lost by death, Mr. Thomas Finlayson, of Leith, who had for many years filled the office of local secretary. For a considerable time feeble health had prevented his taking any active public part in pharmaceutical affairs, but he continued to take a lively interest in the work of the Society, and was always ready to give loyal assistance so far as in his power. They had also lost one of their oldest honorary members, the late Dr. Hugh Clegern, of Strathavie, St. Andrews. He was a very frequent visitor at the Society’s House, and was always ready to show his practical interest in the Society’s welfare. For several years he had been a contributor to the Benevolent Fund.

Before closing, he might refer to the past winter’s evening meetings, which, though not numerous, were very successful. On two occasions they had been so well attended as to make them feel how great an advantage it was to have such a comfortable hall to meet in. At the meetings the subject of Pharmacopoeia revision had been prominently taken up, and they had had a series of communications which he thought would materially aid in the preparation of the new edition.

The Assistant-Secretary then read the report of the Scrutineers as follows:—

“At a meeting held on April 19, 1895, the Executive appointed June 21, 1895, as the date of the election for the ensuing year.

“Three hundred and eighty-three nomination papers were issued by the Assistant-Secretary on May 25.

“The nomination papers returned showed that seventy-four members and associates in business had been nominated, of whom the following twenty-eight signified their willingness to act if elected:—

Anderson, James Grant, 8, Maitland Street, Newhaven, Edinburgh.
Atkens, Robert, 73, Princes Street, Edinburgh.
Baker, William Charles, 13, Dundas Street, Edinburgh.
Bowman, John, 3, Duke Street, Leith.

“Mr. Kinnimont, who had long acted as a representative of Glasgow on the Executive, now retired, and they all wished him much comfort and happiness in his well-earned retirement. He was glad to know that they were to have the services of another gentleman who came from the same district of Glasgow. Owing to a feeling, which was now very general, that examiners should not be also members of Executive, Mr. Sutherland, of Dumfries, also retired. Hitherto they had been able to secure another representative from the southern district of Scotland, and he hoped that by another year they might be able to do so. Mr. Noble also retired, but they would now have the services of two new local men.

Their obituary for the past year was fortunately a short one. He might mention the late Mr. Seath, of Dunfermline, who was an early member of the Society in Scotland; he had been for some years a member of the old Council of the North British Branch, and up till the time of his death acted as local secretary to the Society. He was a very genial man and greatly beloved and respected by all who knew him. A few weeks ago also they had lost by death, Mr. Thomas Finlayson, of Leith, who had for many years filled the office of local secretary. For a considerable time feeble health had prevented his taking any active public part in pharmaceutical affairs, but he continued to take a lively interest in the work of the Society, and was always ready to give loyal assistance so far as in his power. They had also lost one of their oldest honorary members, the late Dr. Hugh Clegern, of Strathavie, St. Andrews. He was a very frequent visitor at the Society’s House, and was always ready to show his practical interest in the Society’s welfare. For several years he had been a contributor to the Benevolent Fund.

Before closing, he might refer to the past winter’s evening meetings, which, though not numerous, were very successful. On two occasions they had been so well attended as to make them feel how great an advantage it was to have such a comfortable hall to meet in. At the meetings the subject of Pharmacopoeia revision had been prominently taken up, and they had had a series of communications which he thought would materially aid in the preparation of the new edition.

The Assistant-Secretary then read the report of the Scrutineers as follows:—

One voting paper had been received too late for the enumeration.

Mr. DAVID MURDOCH, Falkirk, moved the adoption of the report. He was glad to see that they had increased the number of Edinburgh men, for it was very necessary to have a sufficient number to attend to the detail work of the Society. It was, of course, necessary to have the country districts well represented, and he had no fear but that the proper men would be got to do so.

Mr. G. L. MCGIBBON seconded the motion.

The report having been unanimously adopted, the Chairman declared that the first seventeen names on the list given by the Scrutineers—together with the President of the Society (Mr. Michael Cartelge), the Vice-President of the Society (Mr. John Harrison), Messrs. John Johnston (Aberdeen), and David Storrar (Kirkcaldy), as ex officio members—would form the Executive for 1895-6.

On the motion of the Chairman, a vote of thanks was awarded to the Scrutineers.

On the motion of Mr. George Coul, seconded by Mr. William Barley, a cordial vote of thanks was awarded to the retiring Executive.

Mr. LUNAN said he would like to ask if it would not be better to hold the annual meeting in the evening, when a larger number could attend.

Mr. NESBIT said they had to consult the convenience of country members.

Several members said 12 o'clock was a very inconvenient hour.

It was remitted to the Executive to consider the suggestions made.

Mr. MURDOCH, Falkirk, said he would like to ask if any further steps were to be taken to put a stop to the keeping of open shops by surgeons who employed no qualified assistants. There had been some proceedings taken in Glasgow, but it seemed as if the evil still continued.

The CHAIRMAN said it had been clearly established that the practice referred to was illegal, and it would
not be lost sight of. Any cases should be reported to headquarters and they would be attended to.

Mr. Lunan said he would like to suggest that, in connection with the proposed early enlargement of the Pharmaceutical Journal, something should be done to put it into the hands of registered men who were still outside the membership of the Society. He believed it would be the means of increasing the membership. At present there were about 1100 registered chemists in Scotland, of whom only about 400 were connected with the Society. They could do nothing in the way of obtaining a new Pharmacy Act while only about 33 per cent. of the registered chemists had joined the Society.

The Chairman said this was a question of expense. At present a copy of the Journal was sent once every year to every chemist on the Register.

Mr. Lunan said that was not enough. He would suggest that it should be continued every week for a month or so.

Mr. Coull said he understood a copy of the enlarged issue would be sent to every registered chemist.

Mr. Murdoch said those who did not get the Pharmaceutical Journal got the Chemist and Druggist, and thought they did enough when they subscribed for that.

Mr. Lunan said he thought the enlarged Journal would, to a great extent, cover the ground at present occupied by the Chemist and Druggist.

Mr. Nesbit said the Journal had been very greatly improved. He was very much surprised that a larger proportion of registered chemists did not join the Society. There were many advantages in doing so, in addition to getting the Journal.

It was then agreed that Mr. Lunan might bring the matter before the Executive.

Mr. C. F. Henry moved a vote of thanks to the Chairman which was heartily accorded, and the meeting then closed.

**SCIENTIFIC USES OF LIQUID AIR.***

*By Professor Dewar, M.A., LL.D., F.R.S., M.R.I.

(Concluded from page 1183.)

For many purposes of investigation it is necessary to keep liquid air without evaporation. This is readily done by the use of two vacuum test-tubes, fitting freely one inside the other. The smaller one is filled with liquid air, and after the insertion of an India-rubber stopper and glass tube, is completely immersed in liquid air contained in the larger vacuum vessel. This is the most convenient arrangement to use for the production of solid air. For this purpose the tube leading from the outer vessel is connected with an air pump until the pressure is reduced to about 1/4 inch, and therefore the temperature about -200° C. Then a good air pump is put on to the inner vessel of liquid air (containing oxygen and nitrogen in the normal proportion of oxygen and nitrogen), by means of the tube connected to the inner vacuum vessel, while maintaining constantly the exhaustion in the outer vessel. In a short time the air in the inner vessel solidifies to a transparent jelly-like mass.

The same principle is used when the latent and specific heats have to be determined. Now a definite quantity of heat has to be conveyed into the inner vacuum vessel containing liquid air, with the object of finding the weight of liquid that distills off, on the one hand, or the elevation of temperature in the liquid that takes place on the other. For the purpose of adding a given quantity of heat it is convenient in some cases to use mercury, or to lower a piece of platinum or silver, or even glass, into the inner vessel: each unit of heat supplied evaporates a definite amount of air, which is readily ascertained by collecting the gas which comes off during the heat conveyance. In a latent heat determination all that is necessary is to weigh the mercury added and to measure the amount of air by volume which has distilled from the liquid state. If the specific heat of the liquid is wanted, then the inner vessel is exhausted (as well as the outer) through a tube to about 1/4 inch pressure, and the three-way stop-cock turned so as to shut off the tube and connect the inner vessel with a manometer. Mercury is now dropped into the inner vessel until the manometer rises to the atmospheric pressure or the liquid reaches its boiling point under atmospheric pressure. Care must be taken to prevent the drops of mercury falling exactly in the same place, otherwise a mercury stalgmato grows up rapidly through the liquid, vitiating the results. Another objection to the use of mercury arises from the drops causing the rebound of small liquid air drops, which strike the cork and get evaporated away from the main body of the liquid. The amount of mercury added conveys the necessary amount of heat needed to raise the given amount of liquid from its boiling point under 1/4 inch pressure to its boiling point under 30 inches. The relative pressures give the temperature range, and the weight of liquid air or other gas under observation is easily ascertained, together with the weight of mercury added. In this way the latent heat of liquid oxygen at its boiling point is about 80 units, and the mean specific heat between -198° and -182° is 0:39.

Seeing that the most powerful chemical affinities are in abeyance at very low temperatures, it is a matter of great interest to ascertain what change comes over the physical force we name cohesion. Here we are dealing with the molecular forces which are effective in uniting together the particles of solid bodies, in contrast to the force we name chemical attraction, which exists most characteristically between dissimilar molecules. Both are alike in this respect, that they are insensible at sensible distances. If we accept the theory of matter which regards finite heterogeneities of the most homogeneous bodies as proved, then Lord Kelvin has shown that gravitation alone would account for the so-called cohesive forces. Thus, he says ('Popular
Lecturer," vol. i., page 60): "But if we take into account the heterogeneous distribution of density essential to any molecular theory of matter, we readily see that it alone is sufficient to intensify the force of gravitation between two bodies placed extremely close to one another, or between two parts of one body, and therefore that cohesion may be accounted for, without assuming any other force than that of gravitation, or any other law than the Newtonian." Another view of the cohesive forces is taken by Mr. S. Toliver Preston, in his work entitled 'Physics of the Ether," page 64. He says, "The phenomena of 'cohesion,' 'chemical union,' etc., or the general phenomena of the aggregation of molecules, being dependent on the molecular vibrations as a physical cause, it would therefore be reasonable to conclude that vibration of vibrating energy (variation of 'temperature') would have a most marked influence on these phenomena, as is found to be the fact. Further, since when a physical cause ceases to exist the effect also ceases, it follows that at the absolute zero of temperature (absence of vibrating energy) the general phenomena of 'cohesion,' including the aggregation of molecules in chemical union, would cease to exist." If this theory is pressed so as to include the gaseous state, then at the temperature of -274° C. we may imagine the particles reduced to an incoherent layer of dust or powder. The experimental facts do not, however, warrant this conclusion, seeing that at the lowest temperature reached, which is about -210° C., air remains a transparent jelly. That a low temperature causes profound changes in the elastic constants of a metallic body is most easily shown by placing a rod of fusible metal in liquid air, and comparing the deflection produced by a weight when the rod is supported at one or both ends before and after cooling.

The Young modulus is increased to between four and five times its amount at ordinary temperatures. In the same way, the rigidity modulus can be shown to be greatly changed by cooling a spiral spring made of fusible metal wire. Such a spring at the ordinary temperature is quickly drawn out into a straight wire, by attempting to make it support an ounce weight. The same spiral, cooled to -182° C., will support a couple of pounds, and will vibrate like a steel spring so long as it is cool. In the same way, a bell or tuning fork of fusible metal gives a distinct metallic ring at -180°. If two tuning forks are taken of identical pitch, and one cooled to -182°, then on simultaneously striking them beats are very distinctly heard. The simplest plan of getting some idea of the change in the cohesive force at low temperatures, is to ascertain the tenacity or breaking stress of the metals and alloys under such conditions, and to compare such results with similar experiments made at the ordinary temperature with the same metallic samples, using the same apparatus. In this way the comparative values are reliable. The only difficulty is the large quantity of liquid air or oxygen required to cool the steel supports of the wires, which have to be broken. Seeing that wires less than ¼ inch in diameter are unreliable, good strong rigid steel supports are needed, and as these have to be cooled each time a wire is broken, the experiments involve large quantities (gallons) of liquid air and oxygen. Further, as not less than three, and in many cases six experiments must be made with each sample of wire, and the stress in each case can only be applied slowly, work of this kind extends over long periods of time, and this means increased waste of liquid gases. The following table gives the mean results of a large number of experiments:

| Table I.—Breaking Stress in Pounds of Metallic Wires 0.098 Inches Diameter. |
|------------------|------------------|
|                 | 15° 0.         | 18° 0.         |
| Steel (soft)    | 420             | 700             |
| Iron             | 320             | 670             |
| Copper           | 200             | 300             |
| Brass            | 810             | 440             |
| German silver   | 470             | 600             |
| Gold             | 265             | 340             |
| Silver           | 330             | 420             |

An inspection of this table proves that all the common metals and alloys increase in tenacity at low temperatures: thus iron has doubled its breaking stress, and the other metals and alloys are all increased from a third to a half the normal amount. This increase of strength is solely due to the low temperature, and persists only during its continuance. Wires that have been cooled to the temperature of -182° C. and allowed to regain the ordinary temperature, are in no way changed as regards their breaking stress.

A second series of experiments were made with a set of cast test pieces of metals and alloys. The test pieces, all cast in the same mould, were 2 inches long with ½ inch spherical ends, the cylindrical portion being 2/10 inch diameter. The spherical ends of the test pieces rested in similar cavities made in a special set of steel supports that fitted on to the testing machine. Crystalline metals give castings that are far from uniform one with another, and it is very difficult to get even comparable results with metals like zinc, bismuth, and antimony. The following table gives the experimental results:

<table>
<thead>
<tr>

</tbody>
</table>

It will be noted that in this list the breaking stress, by cooling to -182° C., has been increased to three times its usual value in the case of fusible metal, and to twice its usual value in the case of tin, lead and solder. The results with zinc, bismuth, and antimony are exceptional, seeing they appear to be diminished in tenacity. This, however, may be only apparent, because the stresses set up in cooling such highly crystalline bodies probably weaken some set of cleavage planes, so that rupture is then comparatively easy. In any case it must be admitted that no reliance can be placed on the tenacity of highly crystalline metals. The breaking stress of mercury is...
interesting, and turns out to be at $-182^\circ$C nearly half
that of lead at the ordinary temperatures. The per-
centage elongation is not given in the foregoing tables,
simply because the value of such measurements is of
little importance when such short pieces of the metals
are under observation. The general results of such
observations are, however, interesting: thus, lead and
tin at ordinary temperatures elongate before breaking
about the same amount, whereas if tin is cooled to
$-183^\circ$C. it hardly shows any extension, and lead
under such conditions shows no change, stretching as
much at $-182^\circ$ as at $15^\circ$ C. Solder and fusible metal
stretch less, and the cross section of the break is
much less at $-183^\circ$ than at $15^\circ$ C. The above experi-
ments can only be considered as preliminary to a more
elaborate investigation of the actual variation of the
elastic constants at low temperatures. It will require
complex experimental arrangements to get reliable
measurements of the Young modulus and the rigidity
modulus at the temperature of boiling liquid air. In
the case of fusible metal, a first attempt to compare
the ratio of the Young modulus at $15^\circ$ and $-182^\circ$ with
the ratio of the rigidity modulus between the same
limits of temperature, has resulted in finding that
both constants are increased in the same proportion.
From this it would follow that the resistance to com-
pression of the substance at $-182^\circ$C. must be increased
in a similar ratio. The comparative behaviour of
strong steel spirals at $15^\circ$ C. and $-182^\circ$ as to their
elongation on the repeated addition of the same load
was a subject examined on several occasions. The
most careful comparison of such spirals, however,
revealed no measurable differences in their elongation
between the ordinary temperature and that of boiling
oxygen. This may be due to the want of sufficient
sensibility in the testing-machine when applied to
such delicate experiments.

In the meantime it is reasonable to conclude that the rigidity modulus of very hard steel is not much changed by cooling it to
$-182^\circ$ C. If balls of iron, tin, lead or oxygen
are cooled to $-182^\circ$ C. and dropped from a fixed height on
a massive iron anvil the elastic rebound is markedly
increased in all cases. The flat distortion surface
produced on the lead sphere after impact is only one-
third the diameter of the circular surface produced at
the ordinary temperature when the lead ball falls
from the same height.

The examination of the magnetic condition of
matter at low temperatures is a subject of great in-
terest and offers a wide field for investigation. In a
former lecture the magnetic properties of liquid oxygen and air were discussed. Owing to the experi-
mental difficulties, accurate quantitative measure-
ments of the permeability have not yet been successful.
Faraday was the first experimenter who examined the
magnetic condition of matter at the lowest temperature
that could be commanded in his time, viz., about
$-110^\circ$ C. He did not succeed in making any sub-
stance which was non-magnetic at ordinary tempera-
tures assume the magnetic state at the lowest
temperature of the solid carbonic acid ether bath in
vacuo. Later experimenters have directed their
attention more especially to the action of high
temperatures on magnetism, and the work of Pro-
fessors Hopkinson and Ewing in this field of research
is well known. Professor Trowbridge examined the
effect of a temperature of $-80^\circ$ C. on a permanent
magnet, and came to the conclusion that the magnetic
moment was diminished by about 50 per cent.
Professor Ewing found that an increase of temperature
of $15^\circ$ C. above $10^\circ$ caused a reduction of the magnetic
moment of a bar magnet by about 40 per cent., and
that the magnet on cooling recovered its original
state. This result would lead us to expect that if the
same law is followed below the melting point of ice
as Ewing found above it, then a bar magnet cooled to
$-182^\circ$ C. ought to gain in magnetic moment some-
thing like 50 to 60 per cent. The experiment of Pro-
fessor Trowbridge is, however, apparently opposed to
such an inference. It appears, however, that Professor
Trowbridge cooled a magnet that had not reached a
constant state (that is to say, one that on heating
would not have completely recovered its magnetisa-
tion on cooling), because after the magnet had been
cooled to $-80^\circ$ on regaining the ordinary temperature,
it had lost 50 per cent. of its original magnetic
moment. Such a magnet would apparently diminish
in magnetic moment on cooling and heating the first
time the action was examined, but a repetition of the
process when the action of magnetisation and tem-
perature were strictly reversible might lead to an
opposite conclusion.

To settle this question a series of experiments on the magnetic moment of small
magnets cooled to $-182^\circ$ were carried out. Small
magnets from half an inch to an inch in length were
made of watch-spring or steel wire and were either
used separately or in bundles; they were fixed rigidly
in a block of wood by means of copper staples, and in
this condition were easily clamped firmly in the field
of a magnetometer. The cooling was effected by
applying a cotton-wool sponge of liquid air. The rela-
tive deviations of the magnetometer are proportional
to the magnetic moment of the magnet under the
respective conditions of $+15^\circ$ and $-182^\circ$ C. After
the first cooling the magnet is allowed to regain the
ordinary temperature, and the operation of cooling and
heating is repeated three or four times. The following
table gives some of the results, and these may be taken
as typical of a large additional number unrecorded.

If the experiment marked (1) is examined we find
cooling to $-182^\circ$ in the first cycle produced no change
of magnetic moment, but that on heating to $+15^\circ$ C.
the magnet had lost 30 per cent. of the original
strength. In the second cycle cooling increased the
magnetic strength of the magnet, in the condition in
which it is left after the first cooling by 33 per cent.,
and heating diminished it by 5 per cent.; whereas in
the third cycle cooling showed 36 per cent. increase and
no loss in heating. It was only after three alternations
of temperatures from $+15^\circ$ to $-182^\circ$ C. that the
magnet reached a steady condition. In experiment
(3) the first cooling shows a loss of 24 per cent., while
in experiment (4) the first cooling shows a gain of 14
per cent.

Change of the Magnetic Moments of Permanent Magnets at $+15^\circ$ and $-182^\circ$ C. per cent. of the
value at the beginning of each cycle, which is always 15°.

-18° C. +18° C.

(1) Hard steel, 0·5 inches long and 0·4 inches diameter.

Second ............................................... + 33 - 2
Third ................................................... + 33 - 0
Tasted four days after.
First Cycle ............................................... + 50 - 0

It is clear, therefore, that according to these experiments, every magnet has individual characteristics that may either result in no change on cooling or the addition or subtraction of from 12 to 24 per cent. in the magnetic strength. All the experiments, however, show that a repetition of the cycle of heating and cooling brings the magnet to a steady state, in which cooling always causes increase in the magnetic strength of from 30 to 50 per cent., and the re-heating brings about no loss in the original magnetic moment. Such a marked alteration of magnetic strength might be used as a thermometer in low temperature research, and it is my intention to extend the inquiry to the lowest temperature that can be reached by the evaporation of nitrogen in vacuo. A simple mode of showing the sudden alteration of magnetic strength on cooling is to surround a permanent magnet made up of a bundle of steel wires with a coil of copper wire, leaving the ends of the magnet to project so that they can be dipped in liquid air. When the copper wires are attached to a galvanometer, and one of the ends of the magnet cooled, an induced electrical current occurs, due to the sudden magnetic change. Accurate observations must be made on the permeability and susceptiblity of the magnetic metals at the temperature of boiling liquid air, and the above results are an indirect guarantee that this field of investigation will be fruitful in new scientific facts.

This lecture has already covered a very wide field. It is easy to put into a Friday evening discourse the work of a year. Members and friends have chiefly contributed to the Research Fund, which has enabled the Institution to extend the experimental plant needed for the prosecution of research in this field of inquiry, and they have strong claims to learn, in the first instance, the results of the general laboratory work. My object has been to illustrate the scientific uses of liquid air. To do this with any satisfaction requires what may be called a good deal of scientific prospecting. It is one thing to discover where the ore lies, it is another thing to produce the refined metal. Investigations on the properties of matter at the temperature of boiling liquid air must be in the first instance rather qualitative than rigidly quantitative. In my opinion scientific progress is best served by conducting the inquiry on these lines. It will be easy to refine later on.

I have to acknowledge the great assistance I have received in the conduct of these experiments from my excellent chief assistant, Mr. Robert Lennox, and I must also express commendation of the way Mr. Heath has helped in the work.

WESTERN CHEMISTS' ASSOCIATION.

An adjourned meeting of the Western Chemists' Association (of London) was held on June 19, when the President (Mr. R. H. Parker) re-opened the discussion on "The Present Phase of the Poisons Law." He recapitulated the proceedings of the previous meeting (see Ph. J., page 1076), claiming the necessity of establishing pharmacy on a clearer and more logical basis than the recent interpretations of the Pharmacy Acts afforded. He said the subjects urgently demanding consideration in a new Pharmacy Bill were:

1. Company Pharmacy and the Protection of Titles.—The right of a properly constituted limited liability company to own a pharmacy which is under the immediate personal control of a qualified chemist, had been supported by several legal decisions, and could not now be logically objected to, but he maintained strongly that the use of the title "Chemists and Druggists," as applied to any company not consisting entirely of qualified chemists, should bepowerfully opposed, so as to confine their use of the title to the personality of their qualified manager.

2. Branch Shops and Medical Dispensaries.—Every one of these (excepting private dispensaries of medical practitioners) should have a qualified chemist as bond-fide manager, responsible for one establishment only.

3. The Restriction of Dispensing to qualified chemists (medical practitioners being allowed to dispense for their own patients only).

4. The Poisons Schedule needs to be rid of the ambiguity of the term "preparations" in Part I.; all potent "preparations" should be enumerated in Part I., the rest being described in Part II. as "other preparations not enumerated in Part I."

5. Examinations.—The First or Preliminary examination should be much more stringent than it is at present, and the Minor should be divided into "Intermediate" and "Qualifying" sections, so that an assistant on passing the former would be permitted to sell and dispense poisons during temporary absence of the principal; that a thoroughly competent and careful assistant of perhaps eight or ten years' experience in pharmacy should, from a legal point of view, not be trusted to sell a packet of oxalic acid or dispense a prescription for belladonna liniment without supervision was an anomaly, the absurdity of which was not only evident, but extremely inconvenient, to the majority of chemists.

He thought that company pharmacy and the branch
shops difficulty would be best met by the following regulations:

"Every pharmacy (or place where poisons are sold or dispensed) should be registered, and a record kept of its owner or owners; if not actually conducted by its owner, then the name of its "lond fide" manager should be known. This triple record should be corrected annually by a personal visit from the local secretary. A penalty should be incurred by any owner of a pharmacy who failed to conform with this regulation.

"Every such pharmacy should be personally conducted by a qualified manager (who may be the owner) responsible, as regards his assistants as well as himself, for the proper conduct of that pharmacy only; his managership certificate should be cancelled for gross inattention or misconduct."

The resolution embodying these suggestions as submitted to the last meeting (see p. 1076) was then read.

Mr. Butt pointed out that the danger following the existence of the bogus company (or, as it is called, the one-man company) had fairly ceased to exist, for the opinion was rapidly gaining ground among lawyers that such concerns were distinctly evasive, and therefore illegal. As regards qualified managership, he did not think there was need for further legislation, as the present Act was made to apply so closely, that practically no chemist's business could be carried on without a qualified manager, and if anybody knew of such being done, and would communicate with the Secretary of the Pharmaceutical Society, he felt sure it would soon be stopped. He did not think it would be advisable to divide the examination.

Mr. Spyer insisted on the importance of carrying out the requirements of the Poisons Schedule to the full extent—it protected the public and impressed them with the importance of the restrictions.

Mr. Allen agreed with the earlier portion of the proposed resolution, but claimed that an assistant's qualification to permit taking sole charge of a pharmacy for a day or for a fortnight would speedily be recognised by lawyers as sufficient for the whole year; it would therefore lead to the reduction of the educational standard. Nor could he agree with the proposed alteration of the Poisons Schedule—as a matter of fact, the word "preparations" was not now recognised by the lawyers; the judges could not distinguish between quantities, and held that when a man sold a solution of a poison he sold the poison, and the requirements of the Act must be complied with accordingly. He would, therefore, suggest as an amendment that the resolution should read:

"That this meeting, while supporting the policy of the Council of the Pharmaceutical Society in its administration of the Pharmacy Act under recent interpretations, is of opinion that future legislation should be directed towards: (1) the conjoint registration of every pharmacy with the name of its qualified manager and of its owner or owners; the manager to be held responsible for its proper conduct, and together with the owner or owners for any pecuniary penalties that may be incurred; (2) the restriction of dispensing medical prescriptions to registered pharmacists, and (3) the raising of the standard of the First or Preliminary examination."

Mr. Hyne seconded the amendment.

The President, in putting the amendment to the meeting, said he had been under the impression that there were still many chemists' businesses and open surgeries, especially in the north, which were under the management of apprentices or unqualified assistants. He was glad to learn that such was not the case to any great extent, and would soon be a thing of the past. The significance of the word "preparations" could not be logically ignored by the lawyers as long as the present Poisons Schedule existed, for the fact that "corrosive sublimate" stands alone in Part I., and "preparations of corrosive sublimate" in Part II., clearly showed that a preparation of a poison is not the poison within the meaning of the Act.

The amendment, being supported by a considerable majority, was put as the substantive resolution and carried.

CHEMICAL SOCIETY.

The final meeting of the present session was held on Thursday, June 20, the President, A. Vernon Harcourt, F.R.S., in the chair. An extraordinary general meeting was held immediately preceding the ordinary meeting, when the following alterations in the by-laws were unanimously made: "That the life subscription fee shall be £30, with certain exceptions, such as Fellows, who, having paid their subscription for a certain number of years, were allowed to compose for a less amount." At the ordinary meeting the following papers were read:

ON LINNTHNER'S ISOMALTOS.

BY H. BROWNE, F.R.S., AND H. H. MORRIS, F.R.S.

Some years ago Fischer* described a new sugar isomaltose (C_{12}H_{22}O_{11}), obtained in addition to maltose by the hydrolysis of starch. This isomaltose was more recently examined by Linnthner,† who gave a full account of the method of preparation, described its osazone and gave certain physical constants as the crystalline form, melting point, etc. More recently, however, Lingle and Baker‡ have investigated the question, and arrived at the conclusion that isomaltose is a mixture of maltose with probably two other substances, one of which they separated and described as amyloctriose, C_{12}H_{22}O_{11}.

The authors of the present paper being dissatisfied with the nature of the proofs adduced for the homogeneity of isomaltose, and having proved that malto-dextrin, as well as maltose, is produced during the hydrolysis of starch by diastase, undertook the re-investigation of Linnthner's isomaltose. This work was rendered the more necessary since most chemists seem to have accepted the statement that isomaltose is one of the products of starch hydrolysis. The experimental data, upon which the proofs for the existence of isomaltose rest, are the isolation of an osazone by fractional precipitation different in crystalline form, melting point, etc., from malt-osazone. It is noted, however, that there is not the same relation between the optical activity and

---

* Berichte, xxiii, 2889.
† Berichte, xxvi, 2553.
‡ Pharmaceutical Journal [3], 1896, p. 650.
cupric reducing power of this sugar as has always been noted in other sugars. This would give rise to the suspicion that isomaltose is a mixture and not a pure substance. The authors prepared a large quantity of iso-malt-osazone by Lintner's method, which agreed in all respects with that described by him. On fermenting isomaltose only a portion suffered hydrolysis, and though this might be due to the presence of two stereo-isomeric modifications of isomaltose, one of which was fermentable, the other not, experiments showed that this explanation was untenable. The non-fermentable residue did not yield an osazone, but gave the reactions for a maltodextrin. Moreover, the optical activity and cupric reducing power of the isomaltose and the fermentable and non-fermentable portions showed that isomaltose was a mixture of two different substances and not stereo-isomers. Isomaltose can, however, be completely hydrolysed by the continued action of diastase. All this evidence pointed to the conclusion that isomaltose is a mixture of maltose and a maltodextrin. This was finally proved by mixing maltose and maltodextrin, and adding phenylhydrazine, when an osazone identical in all respects with iso-malt-osazone was obtained. Thus, though maltodextrin alone yields no precipitate with phenylhydrazine, when mixed with maltose the osazone produced differs considerably from malt-osazone.

The proof that Lintner's isomaltose is a mixture of maltose and a maltodextrin is thus in two parts: (I.) by separating the components by fermentation or other means; (II.) by forming an osazone identical with iso-malt-osazone from maltose and maltodextrin.

TRANSFORMATION OF AMMONIUM CYANATE INTO UREA.

BY PROFESSOR WALKER AND J. F. HAMLEY.

The authors have investigated the rate of change of ammonium cyanate into urea, and have found that it varies with the temperature, the higher the temperature the quicker being the change. In order to determine the rate of change, a solution of known strength maintained at a constant temperature was titrated at known intervals of time by a solution of silver nitrate, and from this the amount of urea formed calculated. It was found that the action is reversible, i.e., that ammonium cyanate undergoes change into urea, whilst a certain amount of urea undergoes change into ammonium cyanate. This was proved by boiling a solution of urea and then adding silver nitrate, when a precipitate is obtained showing the presence of ammonium cyanate. When the solution is in equilibrium, i.e., no further change takes place, there is about 95 per cent. of urea and 5 per cent. of ammonium cyanate present. If the change is a simple one the velocity constant should be equal to \[ \frac{A}{t - A - x} \]

A = mass of ammonium cyanate originally taken, and x = mass changed in t seconds. Experiments showed, however, that the velocity constant is \[ x \frac{1}{A} \]

and this is the equation for a change in which two molecules interact. The formation of urea must therefore be due to the interaction of two molecules which must be present in equivalent proportions, and therefore the other molecule cannot be water. Three explanations are possible: (I.) that one molecule of ammonium cyanate reacts with another molecule; (II.) that ammonium cyanate undergoes dissociation into ammonia and cyanic acid; (III.) that it undergoes electrolytic dissociation into the ions NH\(_4\) and CN\(_{-}\). The latter of these explanations was proved to be the correct one. The addition of ammonium sulphate greatly increased the velocity constant so that the first explanation cannot be true. Both (II.) and (III.), however, would explain the alteration due to the addition of ammonium sulphate. If it is due to electrolytic dissociation, the addition of ammonia will hardly affect the constant, since ammonia undergoes very slight electrolytic dissociation; on the other hand, if the second explanation be true, the rate should be altered by the addition of ammonia. Experiments showed that with ammonia there was scarcely any change, so that in solutions of ammonium cyanate we have electrolytic dissociation into the ions NH\(_4\) and CN\(_{-}\).

FORMATION OF UREA.

BY H. J. H. FENTON.

The author had arrived at the above results by experiments conducted in a slightly different manner, and published in the Proceedings of the Chemical Society of Cambridge. The amount of change at any given time was determined by treatment with sodium hypobromite and measurement of the nitrogen evolved, since urea yields all its nitrogen on this treatment, and ammonium cyanate only yields half. From these data the amount of change can be calculated.

SOME DERIVATIVES OF HUMULENE.

BY A. C. CHAPMAN.

In previous papers, humulene, C\(_{19}\)H\(_{26}\), a hydrocarbon — seequiterpene — found in oil of hops, has been partly described; it has now been further examined. The nitroso-chloride heated with piperidine yields a nitropiperide, which forms a crystalline hydrochloride and well-defined platinochloride. The nitro-piperide with benzylamine yields a nitro-benzylamine.

Humulene treated with nitrous acid, by mixing with sodium nitrite and adding glacial acetic acid, yields a deep blue-coloured substance, which soon turns green and from which crystals of a bluish-green colour, humulene nitrosite, separate. From the mother liquors, however, colourless crystals were obtained of an isomeric substance, and it was shown that on boiling the blue compound with alcohol it passes first into the green substance and then the colourless isomer.

The difference is probably due to the presence of the groups R'NO and R-N-OH.

HELIUM.
BY PROFESSOR RAMSAY, F.R.S.

For the preparation of this gas thirty-five to forty minerals have been examined, and the gases contained in them obtained and analysed. The gases found were carbon dioxide, hydrogen, hydrocarbons, etc., and helium, but never argon. Three methods were employed to obtain the gas from the mineral.

(1) The mineral was enclosed in a tube of hard glass which was connected to a pump, the tube raised to the highest possible temperature, and the gas evolved pumped out and collected.

(2) The mineral is fused with potassium hydroxide sulphate, and the gases collected as in method (1).

(3) The mineral was boiled with sulphuric acid and water, and the whole conducted in a stream of carbon dioxide.

The resulting gases obtained by one or other of these methods are passed through soda, then mixed with oxygen and sparked for a long time over mercury. The resulting gas is absorbed by soda, and after all the nitrogen is absorbed the residual gas is transferred to a vacuum tube and the spectrum examined. The helium spectrum is very characteristic and contains five bright lines: (1) brilliant red; (2) D₂, the yellow helium line observed in the solar spectrum; (3) peacock blue; (4) blue; (5) violet. It is curious that two lines in the red portion of the spectrum are identical with two of the lines in the spectrum of argon.

Fourteen or fifteen minerals have been found to contain helium, but some of these contain only the slightest trace, 70 grains of a uranium ore from Cornwall, for example, yielding only 0.5 C.C. of the gas. The best sources for the gas are olivette and bröggerite, both oxides of uranium with other constituents.

Uraninite yields 10 to 12 per cent. nitrogen as well as helium, whilst olivette contains no hydrogen, and there is not therefore a hydride of helium. The density of the gas as determined by prolonged passage of the gas over heated magnesium, copper, and drying by phosphoric anhydride is 2.2. The author had previously stated that the density was certainly not more than 3.9 but had not given this number as the density of the gas, but only as a maximum value. Further purification reduced the density to 2.2 but this number appeared constant. The ratio of the specific heats of the gas determined by the velocity of sound in the gas by Kundt's method was found to be 1:65 and this proves that the gas is monatomic.

The solubility of the gas in water was determined, and helium was found to be the least soluble of all gases, the coefficient of solubility being '007, or about half that of hydrogen. From comparison of the spectra of argon and helium it is possible that both these gases are a mixture, but no method has yet been devised for testing this theory.

Helium combines with platinum, as is shown by passing a current through a vacuum tube containing helium, when the tube becomes phosphorescent, due to the formation of a vacuum caused by combination of helium with platinum.

The non-existence of helium in the atmosphere may be due to its very low density, and thus diffusion would take place very rapidly and the gas leave the atmosphere and be attracted to some other great mass such as the sun.

No satisfactory explanation can be given as to how the helium came to be present in these minerals.

Correspondence.

[Letters to the Editor should be written as concisely as possible, on one side of the paper only, and preferably with name and address for publication.]

QUALIFICATIONS OF PUBLIC DISPENSERS.

Sir,—Your article in last week's Journal on the Local Government Board Order relating to the qualification of public dispensers deserves the serious consideration of the pharmaceutical body. In the first place the possessor of the "Hall" qualification and the Army Medical compounder are placed by that Order on an equal footing with the chemist and druggist, although, as you justly observe, the course of training and educational attainments of the latter are vastly superior.

The difference is more especially marked in the case of the Army compounder who has received a very limited training in a more or less narrow groove, and it is eminently undesirable to transfer such a one to the entire control of a union dispensary, where he will be under such different conditions to those he has been accustomed to. For the union dispenser is left in entire charge of the dispensary as a rule, and it is difficult to see why a lower qualification than that demanded for the retail chemist and druggist, on the grounds of public safety, should be considered good enough for the dispenser in an institution where hundreds of poor patients receive their medicine.

On the ground of economy, too, the lower qualification should not be accepted, for the better educated and trained the dispenser is, the more intelligence he may be expected to bring to bear upon his daily duties, and less unsatisfactory work due to paucity of knowledge and experience will assuredly result. Any pharmacist who has taken apprentices or had the misfortune to employ incompetent assistants will appreciate the importance of this point.

St. Thomas's Hospital, S.E.

EDMUND WHITE.
Notes and News.

COLORATION OF PILLS.—A correspondent of the British Medical Journal would have pills coloured so as to indicate their active ingredients. Thus pills containing strychnine should be pink, purgative pills blue, opium some other distinctive colour, and so forth. The idea might be improved upon by varying the shades of the colours used to indicate different strengths, and substances for which no simple colour was available might be distinguished by combinations of two, three, or more colours. Seriously, however, the tendency to increase such purely mechanical safeguards is not worthy of encouragement. The results might be far from satisfactory if, under the proposed arrangement, some strychnine pills should be accidentally sent out another colour than pink.

CATERPILLAR OPHTHALMIA.—Caterpillars are not usually regarded as a source of disease, but at the last meeting of the Ophthalmological Society a case of the so-called "ophthaima nodosa" was brought forward. It appears that the hairs of certain kinds of caterpillars, when made to penetrate the conjunctiva, set up a long-standing inflammation of the tissues of the eye, which may result in a considerable impairment of vision. At this season of the year, when caterpillars abound, it should be remembered that they may prove dangerous if used as missiles; if the eye has been injured in such a way, the British Medical Journal recommends that the conjunctiva should be examined by a magnifying lens, and the extremely fine hairs removed.

LATIN IN PRESCRIPTIONS.—The Alumini Report does not agree with the notion that the use of Latin in prescriptions is necessarily a source of error. It is allowed that to use poor Latin, to abbreviate badly, and to write unintelligibly may lead to errors and endanger life, but that is the fault of the writer, not of the language. The use of Latin is advantageous in that it is a comparatively unfamiliar language, and so enables the physician to prevent his patients reading the prescriptions given to them, but it is of even greater value in that it is not susceptible to change, and latinised names are practically universal. At the same time the value of Latin in prescription writing depends wholly upon its proper use.

MORN NEWSPAPER SCIENCE.—The Westminster Gazette reports that a few days ago all the fish in the pond surrounding the Diana Fountain in Bushy Park were discovered to have been poisoned by the water having been impregnated with what appears to have been prussic acid (sic). Several of the fish have been sent to the divisional surgeon at Kingston for analysis, and all the poisoned water has been drained off and the remainder of the fish destroyed. "A theory prevails that a young chemist from London, who committed suicide in the park by poisoning a short time ago, may have poured some of the poison into the pond as he passed it." It is needless to say that this strange persistence of the prussic acid is not explained.

MEDICAL FREEMASONS.—The Raheres Lodge of Freemasons, No. 2546, is to be consecrated at St. Bartholomew's Hospital on Saturday afternoon, June 29, and the Prince of Wales is expected to be present on the occasion. The Secretary, Mr. T. G. A. Burns, 25, Welbeck Street, W., will be glad to hear from Freemasons, now or formerly connected with the hospital, who desire to be present. On August 1 also, a smoking concert will be held at the Portman Rooms, Baker Street, W., in connection with the Escolapius Lodge and Chapter, and in honour of medical Freemasons attending the meeting of the British Medical Association. Tickets can be obtained from the Honorary Secretary, Dr. T. Dutton, 7, Portland Place, W.

OPTIMUM AND OTHER VAPOURS.—A correspondent of the London thinks the rational use of opium as vapour is worthy of consideration. Great improvements, however, should be made in the official "vapours," the scientific principles on which evaporation depends and their application requiring to be carefully studied if good is to be effected. At present these preparations afford the "most curious evidence of ignorance that can be quoted from the Pharmacopoeia."

"PATERNAL" GOVERNMENT IN FRANCE.—The French Government, despairing of any hope to increase the birth-rate in that country, is now devoting its energies to saving those already born. The new law forbids, under a severe penalty, any one to give infants under one year any form of solid food unless such be ordered by a written prescription signed by a legally qualified physician.

PERMANGANATE IN OPIUM POISONING.—Dr. William Moor, of New York, returns to the charge on this subject in last week's British Medical Journal, where he claims to have destroyed a grain of morphia sulphate dissolved with 200 grains of white of egg in an ounce of water, by adding rapidly to the whole one grain of potassium permanganate dissolved in an ounce of water. This, added to the results of experiments upon himself, leads him to the conclusion that the contents of the stomach will not reduce the permanganate so quickly after administration as to render it useless for antidotal purposes.

CHLORAL HYDRATE FOR EPSOM SALTS.—A case which came before the Clerkenwell magistrate last week revealed extraordinary carelessness and ignorance in the administration of medicine. A labourer living in the Gray's Inn Road accidentally caused the death of his wife by giving her a dose of chloral hydrate. His wife asked him for some salts, whereupon he went to the surgery of a veterinary surgeon by whom he was employed, and helped himself to what he thought was Epsom salts, but was really chloral hydrate, and mixed three teaspoonsfuls of it in water. The poor woman drank it, complained that it burnt her mouth, and died shortly after her husband got her into the hospital.
English News.

[Readers are invited to send local information of pharmaceutical interest. When newspapers are sent the paragraphs to be noted should be plainly marked, whilst cuttings should be verified by the addition of sources and date.]

SHOPBREAKING AT ST. HELENS.—During the night of Tuesday, June 16, an entrance was effected into the shop of Mr. R. Smith, chemist and druggist, Old Market Place, St. Helens, and the place thoroughly ransacked. About fifty shillings was taken in cash, and an assortment of magnifying glasses, hair brushes, test tubes, powders, bottles of scent, etc., etc. The thieves had evidently used skeleton keys and entered by the front door.

SOCIETY OF ARTS CONVERSAZIONE.—The galleries of the South Kensington Museum were well filled on Wednesday evening, June 19, by a large and distinguished gathering on the occasion of the conversazione of the Society of Arts. The guests on arriving were received in the central corridor of the Museum by Major-General Sir John Donnelly, Chairman, and other members of the Council, and on scattering through the galleries found that their entertainments had been prepared. For a memorable concert was given by the band of the Royal Artillery in the North Court, and by the Red Band in the Textiles Court; a concert of glee, madrigals, and part songs, under the direction of Mr. Stanley Smith, was enjoyed in the Lecture Theatre; while in the East Architectural Court was found a vocal and instrumental concert by the Royal Crieron Handbell Ringers and Glee Singers, under the direction of Mr. Harry Tipper; and the important department of light refreshments was situated in the central corridor. The reception of guests commenced at nine o'clock, and General Donnelly and the Council were kept hard at work until past ten by a constant flow of arrivals.

MIDLAND PHARMACEUTICAL ASSOCIATION.—The following appointments have been made by the Council of this Association for the ensuing year:—President, Mr. E. Danton Gostling; Vice-President, Mr. F. J. Gibson (Wolverhampton); Mr. T. W. Clough; Hon. Librarian, Mr. J. Barlow, B.Sc.; Hon. Treasurer, Mr. F. H. Proser; Hon. Auditors, Mr. C. Corfield, and Mr. J. Wakefield; Hon. Secretary, Mr. C. F. Jarvis. Mr. R. D. Gibbs and Mr. C. Thompson were appointed delegates to the meeting of the “Federation” at Bournemouth.

BOTANICAL RAMBLE NEAR SHEFFIELD.—The students of the Sheffield College of Pharmacy, accompanied by the principals, took a botanical ramble to Conisbro’ on Thursday last. This place, which is some fourteen miles from Sheffield, is famed for its Castle, which Scott has immortalised in ‘Ivanhoe.’ Most of the party took boat on the Don in search of Centaurea, which grows plentifully along its banks. Among the specimens collected may be mentioned, Listeria ovata, Habenaria albida, Epipactis palustris, Helieborus foetidus, and Santicula europaea.

DEATH OF DR. WILLIAMSON.—Dr. W. Crawford Williamson, F.R.S., formerly Professor of Botany at Owens College, Manchester, died on Sunday at his residence, Elms Road, Clapham. According to the Standard, Dr. Williamson was born on Dec. 24, 1817, at Stockport, and had been in the practice of his profession therefore, in his seventy-ninth year. His father was an enthusiastic Yorkshire geologist. Dr. Williamson’s first paper on organs remains in the Lias of Yorkshire was published in 1834, when he was only eighteen. His scientific activity has thus extended over a period of sixty years. In 1836 he was appointed Curator of the Manchester Natural History Museum, a post which he held while pursuing his medical studies. In 1842 he began to practice medicine in Manchester, where for many years he pursued his profession with great success. He found time, however, for constant scientific work, and his paper on microscopic vegetation found in the Lias of the Lune (1846) was one of the first memoirs which called attention to the part played by foraminifers in the formation of geological deposits. Dr. Williamson was one of the oldest Fellows of the Royal Society, having been elected in 1854. His later years were devoted to investigations of the structure of fossil plants. His magnum opus is a series of nineteen memoirs on “The Organisation of the Fossil Plants of the Coal Measures,” published in the Philosophical Transactions of the Royal Society, 1871—1893, constitute the most important body of information on these wonderful remains. In 1874 he received the Royal Medal for his researches on fossil plants, which then had more than commenced. He also received the Wollaston Gold Medal of the Geological Society in 1890. He was a foreign member of several learned societies on the Continent. Dr. Williamson was appointed Professor of Natural History and Geology at Owens College in 1881, and continued to hold the office of Bursar till 1889, when he resigned and came to London, where his last years were spent in carrying on his varied researches. By his death, English science loses one of the most distinguished naturalists of our time.

“A CHEMIST’S LOVE AFFAIRS.”—Under this heading the Daily Chronicle reports that at the London Sheriff’s Court, Red Lion Square, on June 21, before Mr. Under-Sheriff Burchell and a jury, the case of Bristow v. Purdie, an action to recover damages for seduction came on for the assessment of damages. Plaintiff was the daughter of Mrs. Bristow, a boarding-house keeper, of Westgate-on-Sea, and the defendant was Mr. Percy Wilfred Purdie, 22 years of age, a chemist, of 5, Sun Street, Finsbury, E.C. The action was brought by Mrs. Bristow, on behalf of her daughter, Miss Edith Kate Bristow, to recover £300 damages. Mr. Terrell said the defendant, aged 21, was a drug dealer, a chemist, his father possessing an old-established business in Finsbury. The defendant went to Westgate-on-Sea in the early part of 1894 to serve part of his articles, and whilst he was there he made the acquaintance of the plaintiff, a young lady of some personal attraction. He made love to her in an ordinary way, wrote her a large number of absurd and ludicrous letters, and presented her with poems and sonnets, perhaps of a more ridiculous character than the letters. Eventually defendant left Westgate-on-Sea to go to London to study for his approaching examination. In October, 1894, he wrote the plaintiff and asked her to come to London to see him. She did so unknown to her parents, with the result that the defendant managed to seduce her. The plaintiff was not called, and the defendant did not appear. The jury assessed the damages at £150.

WHITE WINE VINEGAR PROSECUTION.—William Day, of Day’s Southern Drug Company, Limited, of St. Mary Street, was summoned before the Southampton Borough Bench, on June 21, for selling a certain “white wine vinegar” which was not of the nature, substance, and quality of the article of food so demanded, it consisting entirely of dilute distilled alcohol. —Mr. H. D. M. Page applied for the third sample to be sent to Somerset House to be analysed. —The town clerk (Mr. G. B. Nalder) said that he had no objection. The case was adjourned for twenty-
eight days.—William Walter, of Oxford Street, was similarly summoned, and this case was also adjourned for the same length of time.

DEATH OF A LEEDS CHEMIST.—Referring to the death of Mr. Edward Thompson, chemist and druggist, Leeds, announced in last week's Journal, a correspondent states that Mr. Thompson carried on business for about thirty years in Osley, and when retiring, settled in Leeds. In both localities he took much interest in the Mechanics' Institutes of the respective places, serving on their Committees, and being also an active member of the Leeds Naturalists' Club. Mr. Thompson was much esteemed by his brother chemists, and his bright and genial sociability of mind made him a favorable example of succeos in "the art of growing old."

PROPOSED REVIVAL OF APPRENTICESHIP.—An attempt is to be made to revive the system of apprenticeship under which trade in the City of London once flourished successfully. Of late years it has fallen into almost complete desuetude, and the number of influential gentlemen connected with the City Guilds and commercial undertakings have united in the subject, and with a view to discussing whether it is possible to initiate a revival, a well-attended conference took place on Wednesday afternoon under the presidency of Sir John Lubbock, M.P., at the Drapers' Hall, in Throgmorton Street. Those present included Mr. S. B. Boulton, Mr. Rokeye Price (Chairman of the Stock Exchange), Mr. W. F. Sawyer, Mr. Crace, Dr. Garnett (Technical Education Board, London County Council), Mr. W. C. Steadman, L.C.C., Mr. J. S. Ballin (Chairman of the Provisional Committee), Sir H. Truman Wood, Mr. A. G. Arnold and Mr. G. Code.—The Chairman pointed out that in the past apprentices had played an important element in London life, and they had even played a picturesque and often useful part in English history; but of late that system had somewhat fallen into disuse. Technical education, too long unduly neglected, was now being recognised more as its importance demanded, and though he was satisfied of the excellence of the work of technical institutes from an educational point of view, still the actual craft or "mystery" (as it used to be termed) was best learnt in the workshop. Mr. Ballin submitted a scheme for the formation of an apprentices' college for fitting them for the advancement of apprenticeship. It was urged that the aim of such an organisation should be to educate the children in the direction best calculated to increase their earning power, to elevate their moral and physical status, to avoid as far as possible everything calculated to prejudice them, and to instil the standard of excellence in the vigorous handicrafts, and in connection with this it was suggested that assistance should be afforded with regard to premiums and loans for purchase of tools, etc.—Mr. Sawyer then moved, and Dr. Garnett seconded, a resolution in advocacy of the system of apprenticeship as being "the best means of education in handicrafts."—This was unanimously adopted.—It was further resolved, on the motion of Mr. Rokeye Price, and seconded by Mr. W. C. Steadman, L.C.C., to form an Apprentices' Institution on the basis suggested by the Committee. Mr. A. G. Arnold, Executive was nominated to assist in carrying out the proposal.

The idea of the promoters of the meeting, says the Daily Telegraph, is that parents are now disinclined to apprentice their sons for some years, because they wish them to earn more money at as early an age as possible. It might also be advisable to find out whether the clause of apprenticeship is not in some part due to the apathy of employers, who are so much pressed in the race for quick production that they do not find time to give that personal supervision which apprenticeship demands. Such a state of things is almost inevitable in the existing conditions of commerce, and it is, at all events, impossible to expect a return to the picturesque days of the old London apprentices. It is a pity, but it cannot be done. Very likely the advocates of the revival will limit their attention to the payment of premiums for promising youths, with or without return, and the offering of rewards for skilful apprentices. Both ideas are admirable.

COMPRESSED GAS CYLINDERS.—On Wednesday last, Professor Boys, Professor H. B. Dixon, Dr. Dupré, the Rev. F. J. Smith, and Professor Unwin, who have been requested by the Secretary of State for the Home Department to inquire into and report on the manufacture, filling, and use of gas cylinders, met at the Home Office to continue their inquiry. It was begun on the previous day, Professor Unwin was then elected chairman, and in the afternoon a visit was made to Brin's oxygen works. Mr. Coxeter, Mr. Joseph Aitken, and Colonel Majendie laid their views before the Committee on Wednesday.

THE FENCHURCH STREET EXPLOSION.—In consequence of the recent fatal explosion of a compressed gas cylinder containing oxy-hydrogen for a maggot cutter, at 16 Fenchurch Street, the London and South Western Railway Company has issued the following notice: "Cylinders containing compressed gases will not be accepted for conveyance as passengers' luggage, nor will they be carried by the Company's steamers. Cylinders intended for conveyance must be booked through the parcel or goods offices at the stations. Particulars of the special conditions under which these cylinders are conveyed may be obtained at the office at the time of booking."

A CHEMIST'S APPRENTICE DROWNED.—Mr. J. R. Wood, the City Coroner, held an inquest on Saturday, June 15, at the Courts of Justice, York, on the body of Thomas Stelling Robinson, of Harrogate, who was drowned in the River Ouse at York on Friday. The deceased was 20 years of age, and apprenticed with Mr. Atkinson, chemist, Regent Parade, York. He was sculling on the river on the previous Friday afternoon, when a steamboat collided with the boat, and though he could swim a little he sank in a very short while. A verdict of "Accidentally drowned" was returned.

MANUFACTURING PHARMACISTS' OUTING.—The annual outing of the staff and employees of Messrs. C. J. Hewlett and Son took place on Saturday, June 22. A large party proceeded at an early hour to Eastbourne, and the morning was spent in excursions to Beachy Head and the neighbourhood. An excellent dinner was served at the Pier Hotel, and the chair was taken by J. H. J. Allman F.S.S., the senior manager of the firm. In proposing the toast of "The Firm," Mr. Allman referred to the progress of the firm and the altered conditions of pharmacy during the twenty-five years in which he has represented Messrs. Hewlett and Son. Mr. Tucker, the manager, suitably responded. In the afternoon the party was arranged on sailing yachts, and was reached at a late hour, after a most enjoyable day. The weather was perfect, and the arrangement carried out in an excellent manner through the liberality of the firm.
Scotch News.

EDINBURGH CHEMISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION.—In connection with the botanical rambles of this Association, a new idea has been started this season with a view to increasing the interest and usefulness of these outings. The plan is to hold a summer meeting of the Association about a week before the arranged ramble takes place, and at this meeting the members are expected to bring forward as many of the plants likely to be met with as they can find opportunity of procuring. The first of these meetings was held in the Pharmaceutical Society's House, 86, York Place, on Wednesday, June 19, Mr. Alexander Swanson, of the Botanical Department of the chair, presiding. The meeting was held notwithstanding adverse weather, several members having procured a large supply of specimens, and these were laid out for exhibition. The meeting lasted from 8.30 to 10 p.m. During the early part of the meeting the members had an opportunity of walking about and examining and discussing the plants, which had been previously named and ticketed. At 9.15 p.m., at the request of the Chairman, Mr. Hill briefly pointed out the chief features of the plants shown. The orders represented were: Ranunculaceae, Cruciferae, Resedaceae, Caryophyllaceae, Liliaceae, Hypericaceae, Asclepiadaceae, Leguminosae, Rosaceae, Onagraceae, Urticaceae, Caprifoliaceae, Rubiaceae, Valerianaceae, Dipsacaceae, Composite, Labiatae, Boraginaceae, Chenopodiaceae, Polygonaceae, Euphorbiaceae, Urticaceae, Ulmaceae, Salicaceae, Liliaceae, Gramineae, Equisetaceae, and Fungi. One interesting specimen was a plant of Faba vulgaris, the common bean, showing the roots covered with the tubercules or nodules recently shown to consist of colonies of nitrogen-fixing bacteria. Most of the specimens came from Colinton Dall, to which there was to be an excursion on June 26. Others were from Craig Leith, and on the motion of the Chairman thanks were awarded to those who had provided the specimens and to Mr. Hill. There was a good attendance, and a very profitable evening was spent, the general feeling being that the new idea had worked well.

THE LATE MR. THOMAS FINLAYSON.—Mr. Thomas Finlayson, pharmaceutical chemist, late of North Fort Street, Ferry Road, Leith, who died on June 18, was a native of Kirkcudbright (Thurso), and in early boyhood came to Leith, where his father was engaged in the chemical trade. After serving an apprenticeship with Mr. McDonald, of North Fort Street, Edinburgh, Mr. Finlayson was for some time assistant to Dr. Murray, Kirkcaldy, and shortly afterwards purchased the business, which he carried on for a number of years till he removed to North Fort Street, where he continued in business till 1893, when he retired, owing to failing health, having suffered for several years from a bronchial affection. He became a member of the Pharmaceutical Society in 1853, and was appointed local secretary for Leith in 1871, an office which he continued to hold till 1893. He was a quiet man, of kindly disposition, and was much respected by all who knew him. He took a lively interest in the affairs of Bonnington United Presbyterian Church, of which he was an esteemed office-bearer.

Irish News.

PHARMACY ACT PROSECUTIONS.—At Roscommon Petty Sessions on Monday, the 17th instant, the magistrates being Mr. Browne, R.M. (Chairman), Mr. John Neilson and Mr. Thomas Shiel, a case came on of the Pharmaceutical Society of Ireland v. Jones. At a session of the Court three weeks previously Mr. James Jones and another defendant appeared on summonses charging them with breaches of the Irish Pharmacy Act, 1875, and the Poisons Act, 1880, by having on March 1, in the present year, sold "Bigg's Sheep-Dipping Composition" and "Cooper's Sheep-Dipping Powder," both containing poison, without having licenses to procure or sell the same. The defendants, who were also charged with unlawfully keeping open shop for the sale of poisons. In consequence of the Pharmaceutical Society not being named as the complainants in these summonses three of them were dismissed and two adjourned.—Mr. J. M. Whelan, solicitor, appeared for the defendants to prosecute in five fresh summonses, charging the same offences, but in which the defendants were Miss Jane Jones, Mr. James Jones, the defendant in the former summonses, and Mr. Antony Cowdy, these persons being, as was stated, the successors in business of Mr. John Jones, deceased since March, 1883, and Mr. Cowdy being his executor. The establishment in which the compounds were alleged to have been sold is a general hardware and grocery shop in Castle Street, Roscommon.—Mr. Burke, solicitor, appeared for Miss Jones and Mr. Jones, and objected to the cases going on, upon the ground that the defendant has only served last Friday evening at the Castle Street place of business, and that Mr. Cowdy did not reside there at all, and had had no notice of the proceedings.—Mr. Whelan maintained that the service was sufficient for all parties. The magistrates decided to adjourn the hearing of the fresh summonses to that day fortnight, being the next court day, and to dismiss without costs the previous summonses against Mr. Jones.

A PHILANTHROPIC PHARMACIST.—At the Grand National Bazaar now taking place in the Queen's Steam Laundry, London, and under the auspices of the Royal Humane Society, a bazaar has been arranged for the benefit of the ladies of Belfast, the proceeds being reserved for the use of the ladies of that city. The bazaar is being held—the Society for the Prevention of Cruelty to Children, in connection with which there is a prosperous branch. Mr. Payne has an establishment in Belfast and another at Holywood, a prosperous little water-logging place on the four mile estate which lies near the side of Belfast Lough. At the bazaar in the Queen's Hall the Belfast branch has "The Linen Stall," and amongst the names of a number of several noble ladies presiding over it will be found that of Mrs. Payne, while one of the stewards is Mr. Payne, who with his wife went over to London to adjourn there during the bazaar. But space does not suffice to tell of all the service they have rendered to the above admirable Society, and, indeed, to kindred institutions.

NEW PHARMACY IN BELFAST.—On the Castle Lane side of the Imperial Hotel a new pharmacy has been opened, and to it there has been very appropriately given the title of "The Imperial Pharmaceutical Establishment." Formerly the Imperial Hotel occupied the building down to the ground. During the past few months the lower storey of the house has been erected into an architect's office and the upper floor into a spacious, well-lit, cabinet room, the interior of which is in the hands of Messrs. Ball and Co., well-known chemists of the city. At the opening of the new establishment the proprietors, Messrs. Ball and Co., who have had a long and successful practice in the city, held a demonstration of apparatus, and the premises were well crowded. The new establishment is tastefully fitted up and is calculated to attract trade.
ANOTHER NEW PHARMACY. — The commercial capital of Ireland continues to make wondrous strides as regards population. In all directions Belfast continues to spread, and into it yearly the working classes continue to pour. Here they have the self-contained house which they cannot obtain fitted out in the same complete manner in either England or Scotland, and here, too, they secure employment for their daughters as well as their sons. One of the most rapidly extending districts is Duncairn Gardens, which lies out under the shadow almost of the celebrated Cave Hill, but which is also so high that from it there can be obtained views of Belfast Lough and of the coasts of Antrim and Down. Here Mr. S. T. Cleland, L.F.S.I., is opening a pharmacy. The site is surrounded by rapid developments in the general district, and business should follow. Mr. Cleland's prospects seem most favourable.

Welsh News.

DEATH OF A COUNTY ANALYST.—The death is announced of Dr. William Morgan, of Swansea, which took place on Wednesday week, at his residence in Northampton Place. The deceased, who had been suffering for a long time from Bright's disease, was public analyst for Glamorganshire, Swansea, and most of the counties in South Wales. He was Chairman of the Swansea School Board, and principal of the Swansea Technical School. The funeral took place on Saturday last, and was largely attended by public men from all parts of South Wales. Dr. Morgan was only 43 years of age. Votes of condolence with the relatives of the deceased were passed by the Glamorgan County Council on Thursday, on the motion of Mr. T. J. Hughes, seconded by Sir John Llewelyn, and by the Council of the Swansea Training College. Mr. Charles Seyler, the deputy analyst, has been appointed by the Glamorgan County Council to discharge the duties of analyst until a successor to Dr. Morgan has been decided upon.

"ONE OF SATAN'S SLAVES."—A young man named Bertie Potter died in Swansea Hospital on Sunday from the effects of poison. On an envelope he had written, "Bert Potter 12 o'clock exactly; 25 £1895. One of Satan's slaves."

UNIVERSITY OF WALES.—The Committee of the Medical General Council, London, have included the new Welsh University under Division I. in the list of exempting the students from the effects of opium in Godfrey's Cordial. Verdict: "Death from an overdose of poison, accidentally administered."

Operation.—Thomas Ernest Percy Pugh, aged 9 days, died on Thursday, May 30, at 20, Bridge Street, Shrewsbury, from the effects of spirit of salt, self-administered. Verdict: "Suicide during temporary insanity," and the jury added a rider expressing an opinion that all poisons such as spirit of salt, carbolic acid, etc., not protected by the Act, should have more stringent measures put upon them to prevent their sale.

MISTERY MOUSING CASE.—A mysterious poisoning case has occurred at Swansea, the cause of which has not been ascertained. A few days ago a family named Hill was taken suddenly ill after eating veal and cake, and the father died. Post-mortem examination took place, and the veal and baking powder with which the cake was made were subjected to analysis. Mr. Charles Crocker, Assisant to the Public Analyst, has certified that the veal and baking powder were free from vegetable or mineral poison, although the veal was partly decomposed. The mystery therefore remains unsolved.

GRATUITIES AND DONATIONS.—The South Wales Merchants' Protection Association, which includes a number of local chemists, has resolved that "no subscription or donation be given by members of the Association to pio-nics, summer outings, or for Christmas boxes after this date."

FOOD AND DRUGS ACT.—A novel defence was set up by the defendant in a milk adulteration prosecution at Merthyr last week. Shadrach Dando was summoned for selling milk adulterated with 16 per cent. of water on May 11. The point raised was that the hearing of the summons must take place within twenty-eight days of the commission of the offence, as milk was a perishable article. The Stipendiary held that the objection was good, and dismissed the case.

Poisoning Cases and Inquests.

Carbolic Acid.—George Unsworth was found dead on Tuesday, June 18, in Newham Park, Tooting, having died from the effects of carbolic acid, self-administered. Verdict: "Deceased died from drinking carbolic acid, but there was no evidence to show the state of his mind when he took it."

Carbolic Acid.—Annie Elizabeth Fletcher, aged 24, died on Friday, June 7, at Garden Terrace, Main Street, Keswick, from the effects of carbolic acid, self-administered. Verdict: "Suicide whilst temporarily insane."

Carbolic Acid.—Hester Francis, aged 16, died on Sunday, June 16, at Notting Dale, London, from the effects of carbolic acid, self-administered. Verdict: "Suicide whilst of unsound mind."

Ammonia.—Ann Costes, aged 74, died on Tuesday, June 11, at Worsthorne, from the effects of ammonia, self-administered. Verdict: "Deceased by inadvertence drank some ammonia, and thereby accidentally came to her death."

Spirit of Salt.—Louise Alice Stone, aged 18, died on Sunday, June 16, at 31, Lombard Road, Battersea, from the effects of spirit of salt, self-administered. Verdict: "Suicide during temporary insanity," and the jury added a rider expressing an opinion that all poisons such as spirit of salt, carbolic acid, etc., not protected by the Act, should have more stringent measures put upon them to prevent their sale.

Carbolic Acid.—William Henry Brongham, aged 48, died on Monday, June 17, at 122, Lambden Road, Hulme, from the effects of carbolic acid, self-administered. Verdict: "Suicide whilst insane."

Chloral Hydrate.—Caroline Sandford died on Wednesday, June 19, in the Royal Free Hospital, London, from the effects of chloral hydrate, administered to her by her husband, Alfred Sandford, in mistake for Epsom salts. Verdict: "Accidental death."

Prussic Acid.—Stephen Hughes, aged about 54, was found dead in a field at Sea Mills, on Tuesday, June 18, having died from the effects of prussic acid, self-administered. Verdict: "Deceased died from the effects of a dose of prussic acid, taken whilst of unsound mind."
Patent Office Business.

APPLICATIONS FOR PATENTS.
[From the Illustrated Official Journal (Patents).]

No. 11,325.—Improvements in means or apparatus for inspecting the throat, eyes, or other organs, and for similar purposes. June 10.

No. 11,439.—Improvements in and connected with pestle and mortar machines. June 12.

No. 11,522.—Improvements in or relating to the heating or cooling of fluids and apparatus therefor. June 13.

No. 11,551.—Improvements in graduated glass measures. June 13.

No. 11,701.—An improvement in syringes. June 15.

No. 11,702.—A new or improved ointment, balm, or liniment. June 15.

• PATENTS PUBLISHED JUNE 8.

Satisfying sugar, etc. (Blyth, D.).—Sugar, glucose, sewage, etc., is filtered and decolourised by passage through a bed of magnetic iron oxide, a current of electricity being passed through the oxide as required, to "increase the quantity of ozone generated by the oxide," and oxygen gas may be forced through it at 130° with the same object. No. 5516 of 1894.

Preserving meat, etc. (Lake, H. H., communicated from Delangle, F.).—The meat or other organic matter is suspended in a chamber through which a current of cold air is constantly circulated by means of a blowing apparatus. The inventor states that putrescible substances may be thus preserved for months. No. 6010 of 1894.

Ear-trumpet (Leigh, H.).—Comprises a small tube shaped like a post-horn and of such a size as to fit within the ear. An artificial drum resting against the drum of the ear, is formed of a disc of indiarubber tissue and a "sucker" consisting of an indiarubber annulus surrounding the artificial drum is applied, so that, in case the drum of the ear has sunk inwards, it shall be drawn back into its normal position. No. 9394 of 1894.

Beverage-products from sodium-carbonate manufacture (Greenwood, J.).—The ammonium chloride obtained as a by-product in the "ammoniation" process, is digested with zinc oxide instead of with lime, as is usual, to liberate the ammonia. The zinc chloride thus produced is electrolysed with production of zinc and chlorine, which may be utilised as required. The zinc oxide may be obtained by roasting zinc ore. Other metals, which are reducible electrolytically, may replace the zinc. No. 11,655 of 1894.

Making white lead and ammonia salts (Wilcox, H.).—A mixture of ammonia and carbonic acid gas in the proportion in which they exist in ammonium carbonate, is obtained by heating a solution of ammonium sulphate or other salt of ammonia, and chalk, and the mixed gases and steam are led through a solution of nitrate or other salt of lead. The lead is precipitated as basic carbonate, and nitrate or other salt of ammonium is produced. Sometimes the lead carbonate is precipitated from the basic acetate, the gases being first passed through dilute nitric acid to remove the ammonia, before passing to the acetate. No. 15,202 of 1894.

Ammonia from air (Mackey, W. M., and Hutcheson, J. F.).—A vertical furnace is charged with a mixture of carbonate, hydrate, oxide or nitrate of potassium, usually with a proportion of not more than 30 parts of similar compounds of barium, calcium or sodium, and the necessary amount of coal, coke, or other fuel. A blast of hot air is supplied through tuyères at the base of the furnace, and at a suitable height, steam is supplied to decompose the cyanides produced below, into alkaline carbonate and ammonia, the latter of which is carried away to a suitable condenser. No. 13,315 of 1894.

PATENTS PUBLISHED JUNE 15.

Alkaline ferrocyanides (Crowther, H. W., Rossetter, E. C., Hood, J. J., and Albright, G. B.).—The ferrocyanide of potassium or sodium is prepared by heating the fuse sulpho-cyanate with iron turnings or borings in the proportion of 65 parts of iron to 97 parts of the potassium sulpho-cyanate or 81 parts of the sodium salt. If the iron contain any oxide, this is converted into sulphide by treatment with an alkaline sulphide or the like in solution. The sulphocyanate is first dried by heating in an oven, such as that from a lime-kiln, and the iron is added and the heat raised. The reaction is assisted by stirring the mixture. The mixture of iron sulphide and alkaline ferrocyanide obtained is lixiviated, and the latter salt is crystallised out. No. 8305 of 1894.

Electrolyte (Gaulter, F.).—The electrodes used in the electrolysis of fused sodium chloride or other salts are kept cool by a stream of water suitably supplied. The temperature at which they are kept depends on the nature of the salt under treatment. No. 10,032 of 1894.

Hemoglobin (Hommel, A.).—Purified hemoglobin is obtained from blood as follows: The fresh blood is freed from fibrin, and the dissolved gases are removed by exposure to a vacuum in the cold. About 20 per cent. of water containing a "volatile antiseptic," such as creosote or alcohol, is then added, and the mixture is evaporated in vacuo at about 30° or 40° C. After the water has been thus distilled off, the temperature may be raised to 55° or 60° C, especially if creosote has been used. The urea and hippuric acid are removed by hydration and conversion into volatile compounds. The product is a deep red solution of hemoglobin, and may be mixed with glycerin or other substance to overcome its insipid taste. No. 12,504 of 1894.

Pessary (Golby, F., communicated from Weisgerber, F.).—Comprises an indiarubber or other perforated bag containing a suitable antiseptic capable of destroying bacteria, and of generally disinfecting the vagina. The antiseptic is gradually dissolved by the warm vaginal fluids. No. 12,502 of 1894.

Sulphocyanates (Albright, G. S., and Hood, J. J.).—Alkaline sulpho cyanates are prepared: (1) by digesting together ammonia, carbon bisulphide, and magnesium, whereby sulpho cyanate of ammonia and sulphhydrates of magnesia are produced; (2) by employing the same reactants together with a fixed alkali or alkaline earth, whereby sulpho cyanate of the alkaline or alkaline earth, metal, and sulphhydrates of magnesia are produced. In either case the magnesia salt is decomposed into sulphured hyrogen and insoluble magnesium hydrate by boiling the solution, and the sulpho cyanate is obtained by decantation and evaporation. No. 14,154 of 1894.

Abdominal belts, suspenders, etc. (Coe, L. E., and Smith, H.).—Abdominal belts made in several pieces stitched together and shaped to the figure, are provided with eyelet holes round the lower edge, from which depend straps for supporting stockings and other garments. No. 4942 of 1895.

Case for surgical instruments (Schreus, T.).—Comprises a metal case so arranged that the instruments, etc., in it may be sterilised by means of steam without necessitating their removal. No. 7262 of 1895.

Thermometers (Brückner, J.).—Clinical and other thermometers are made with a mercury cup or capillary indicating mercury column, but with the usual bulb containing the bulk of the mercury, replaced by a single or double spiral column, whereby a larger surface is exposed. No. 8117 of 1895.
New Remedies.

[The notes given under this heading, for the information of dispensers, embody recent suggestions in therapeutics, and cover both new drugs and preparations, and old ones under new aspects. The word "parts" is used to represent parts by weight, both for solids and liquids.]

QUININE DICHLORHYDRATE SUBCUTANEOUSLY IN WHOOPING COUGH.—Laubinger employs this salt in solution in water, in three strengths, viz., 10 parts in 10 parts of water; 6 parts in 14 parts, and 5 parts in 15 parts. One gramme of these solutions contains 50, 30, and 25 centigrammes respectively of the alkaloidal salt. The injection is made into the back, the syringe being slowly withdrawn, and is accompanied by slight kneading of the parts surrounding the point of injection to assist re-absorption. As a rule, two injections daily are sufficient, and generally the weaker solution will be found sufficient (Rev. de Thérap. Med. Chirurg., after Jahrb. für kind. Heilk., lix., 319).

TRIONAL AS AN HYPNOTIC.—Dr. Galliard reports that only five out of forty cases of insomnia which he treated with one-gramme doses of trional proved refractory to the remedy. The action was purely hypnotic, and no interference with the physiological action of other medicines given at the same time was noticed. Both sleep and waking after the dose were normal. The treatment was employed in simple insomnia, in neurasthenia, morphinomania, and in febrile, cardias, and tuberculosis affections. It is administered in cachets and acts very promptly, sleep being produced in twenty minutes (Bull. gén. de Thérap., civi., 426).

INJECTIONS OF SALICYLIC ACID IN INOPERABLE UTERINE CANCER.—Fallus has repeated the treatment recommended by Bernard of injecting salicylic acid in cases of uterine cancer. He finds that this method of treatment diminishes and even stops hemorrhage, removes offensive odor and irritant discharges, lessens pain, and ameliorates the general state of the patient. The treatment is, in fact, superior to all other palliative methods when the disease is too far advanced to permit of surgical extirpation. A 6 per cent. alcoholic solution of salicylic acid is employed. 1 to 4 cubic centimeters of the liquid being injected into the neck of the uterus by means of a Pravas syringe inserted to the depth of two-thirds of a centimeter in three or four different places. The ordinary antiseptic precautions are taken both before and after the injection, and the patient is kept in bed for twenty-four hours after the operation. The injection is repeated every three or four days (Rev. de Thérap. Med. Chirurg., lixi., 318, after Med. Obs., 1, 1896).

MICROCIDINE IN OZOGNA.—Consolino employs the following ointment:—microcidine, 1 part; cocaine hydrochlorate, 15 parts; vaselin, 3000 parts; mix. To be sniffed up the nostrils three or four times daily (Rev. de Thérap. Med. Chirurg., lixi., 323).

TAR FOR HEMORRHHOIDS.—The following mixture applied night and morning to the nodules will effect a cure in from four to twelve days. Wood tar, 3 parts; extract of belladonna, 3 parts; glycerine, 50 parts (Rev. de Thérap. Med. Chirurg., lixi., 323).

PILOCARPINE IN ALLAYING DIABETIC THIRST.—Five or six drops of the following solution of pilocarpine nitrate are dropped four or five times daily upon the tongue. Nitrate of pilocarpine, 6 parts; alcohol, 30 per cent. by volume, 300 parts; distilled water, 800 parts (Rev. de Thérap. Med. Chirurg., lixi., 323).

Notes and Queries.

[The information given in this column includes both notes of practical interest to pharmacists, and replies to queries which seem to possess sufficient interest to readers generally.]

PEACH KERNEL OIL.

[886.] Peach Kernel oil usually mixed on the Continent "Ol. amygdalinum duellium gallium," and used as a substitute for almond oil, possesses a peculiar odour, which is specially noticeable when the oil is warmed. As previously mentioned in the Journal, this smell is due to the presence in the oil of a small quantity of benzaldehyde, which can easily be extracted by shaking the oil with sodium bicarbonate and then decomposing the resulting compound by means of alkali. The benzaldehyde is no doubt formed by the decomposition of a small quantity of the amygdalin while the kernels are being pressed. (Journ. d. Pharm. v. Elis.-Loth., 1895, 153). The quantity of benzaldehyde obtained, is, however, so small as to be practically useless, except in so far as it goes to demonstrate the origin of the peculiar odour referred to.

REMOVAL OF STOPPERS BY ELECTRICITY.

[896.] To avoid the inconveniences attending the application of heat from a flame in removing glass stoppers that have become fixed, R. W. Hill (Chem. News) uses an electric lamp which is attached a strip of asbestos, in which coils of platinum wire are embedded. The clamp is pressed round the bottle-neck, a current of electricity allowed to pass, and sufficient heat is generated to expand the glass and so loosen the stopper.

PREPARATION OF MERCURIAL OINTMENT.

[897.] This ointment is prepared by W. Lawrence (Pharm. Post), and said to form a very intimate mixture, by placing three kilos. of mercury in a suitable vessel, adding to it a solution of 60 Gm. of ferric chloride in 250 Gm. of water, and agitating the vessel until a paste is formed (about a quarter of an hour). The iron is then removed by washing with water some ten to fifteen times, by the aid of a siphon. The mercury remains in a pasty condition and is next mixed with a small quantity of lard, and left for twenty-four hours after which the rest of the exudate is added.

RAPID PREPARATION OF FOWLER'S SOLUTION.

[898.] A direct method of preparing this solution is described by T. Garrant (Bull. de Pharm. de Bord.), who replaces the potassium carbonate by caustic potash. He dissolves 10 Gm. of arsenious anhydride in 145 Cc. of normal potash solution (or a solution containing 810 Gm. anhydrous caustic potash), filters, and adds 813 Gm. of distilled water, and 30 Gm. of tincture of meline (Melissa officinalis, L.) The proportions are, of course, based upon the formula of the French Codex, but the process may be worth adapting to the English preparation because of the rapidity with which a solution of constant alkalinity may be prepared in the cold.

MILK OF MAGNESIA.

[899.] Harding prepares this as follows:—Six ounces of caustic potash are dissolved in 4 pints of water, and strained through cotton. Ten to 12 ounces of magnesium sulphate is also dissolved in 4 pints of water, filtered, and mixed with constant stirring. Finally the precipitate is washed well, tested, and then suspended in the smallest quantity of water. The volume of the finished "milk" should be about 2½ pints. According to the author, it is important that the solutions should be hot when mixed, and all could be washed with hot water, the precipitate being much finer than when cold solutions and washings are employed (West. Drug., xvii., 183).
PHARMACEUTICAL JOURNAL.

June 20, 1876.

Notices, Letters, and Answers to Correspondents.

COMMUNICATIONS FOR THE CURRENT WEEK'S JOURNAL SHOULD REACH THE OFFICE, 37, BLOOMSBURY SQUARE, LONDON, W.C. ADDRESSED "EDITOR,"zierlier THAN THE FIRST POST ON WEDNESDAY. TELEGRAMS CAN BE RECEIVED ON THURSDAY MORNING. TELEGRAPHIC ADDRESS: "PHARMACEUTICAL JOURNAL, LONDON."

Advertisements (except for the "Exchange" column), orders for copies of the Journal, and instructions from Subscribers respecting transmission of same, should not be addressed to the Editor, as a short delay will be caused. See directions on Editorial page.

Correspondents who wish notices to be taken of their communications must write in ink on one side of the paper only, and should avoid the use of too many exclamation marks.

Names and formularies should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

* * * Queries should be addressed "Editor," and will be replied to in a friendly manner at all times, answers of sufficient general interest being given under the head "Notes and Queries."

LETTERS.

EXTREME CUTTING.

Mr. A. W. Hall, of Oppenheim, Son, and Co., Ltd., writes on this subject as follows:—"We have observed the correspondence in your esteemed Journal with reference to the matter of 'Extreme Cutting,' and quite appreciate the nature of the difficulty in this direction, and know that unless something is done to secure reasonable profit to the chemist and retailer it will not be worth his while to push the sales of proprietary articles. In this state of feeling, we formulated a memorandum of agreement with our dealers in order to secure for them a profit upon sales to the retailers, and recently we have arranged an agreement which has already been signed by a very large number of the leading stores and cutting chemists, arranging that they shall not retail our pharmaceutical products and appliances at lower rates than those published in our current price-list. By doing this we hope to receive the mutual support of the retail trade in a matter which is advantageous to all concerned."

THE METRIC SYSTEM.

"Gilders" objects to the adoption of this system in the following vigorous terms, but he leaves out of sight the fact that professional chemists and others who have employed metric weights and measures daily for years past are in full accord as to their advantages, and are generally unaware of any corresponding disadvantages. It is time that some of the good old feeling which is in existence should have a voice. The feeling has been nurtured on the arguments of men like Sir John Herschel and Piazzi Smyth on the usage of centuries, and on the belief that what is English is good for an Englishman. It is quite possible that some of these theoretically perfect Parliament may be set up some day somewhere, but it would be a great mistake for the 'mother of parliaments' with her precursors slowly broadening down, to adopt it. There is an English genius and there is a French genius, and leaving all sentiment out of the question, the French metric system is an impostor, is a misapprehension of the beginning, and its only merit is a certain simplicity which implies that tens are easily added or multiplied. In these days of advancing mind, of forward movement in every direction, but especially of educational training, is it possible that the heirs of all the ages find our arithmetical too difficult? I know that many will bitterly regret my pandering with or truculently to error however erroneous, with munostrosity however fashionable, or with force. The chemists are suffering from a new departure; the old man of the woods, with the features of the country parson predominant, is on his back in the shape of the stores; but discipline is thrusting through his gates, and will also overwhelm us if we weakly navigate our Pharmaceutical vessel for the purpose of catching French whales which have been already landed and found to be sprats. What a legitimate lever the old Latin pharmacopoeia would now be to close the eyes, and the interlopers who would always get in and make the little rift within the lute? Let us hope not."

PRISON DISPENSERS.

"Associate" thinks it may be interesting, though it certainly will not be very flattering to dispensers, to know the manifold duties of compounding at H.M. prisons, according to information obtained at a local prison. The prison is a big one and is being used to assist in keeping medical records; to keep instruments in good order and to assist at operations when required; to sleep in the hospital on alternate nights, and to take temporary charge of the hospital at other times during temporary absence of hospital warder; to conform to directions he may receive from time to time from the Commissioners, Governor, or Medical Officer; to be responsible for good order of dispensary and safe custody of drugs. It is disagreeable and item four is humiliating, and it is surprising that such duties still live on. In addition to these, a compounder must submit his physical fitness to unpleasant methods of criticism and he is required to ask our Council to suggest the authorities the folly of such requirements? Perhaps this is the proper time."

SECTION CUTTING.

"Elbow-Joint" finds a difficulty in following some instructions given in the Journal. He says:—"The excellent article on the study of Materia Medica recently published in the Pharmaceutical Journal, aroused my interest, and I have done the same with the few sections of the body I have decided to cut some sections, but, as I possess no joint in my arm between the elbow and the wrist, the principal result of my contortions was an attack of cramp. Surely, sir, the left arm should be steadied against the side, while the right hand, carrying the razor, should move freely." "Elbow-Joint" has accurately solved the problem unconnectedly set by the writer of the article in question, and may, with an easy mind and much profit, go on cutting sections in the way he now suggests.

PHOTOGRAPHY FOR CHEMISTS.

Mr. W. Pilkington, M.P.S., of Burton, writes as follows, and am pleased to note that you are lending a helping hand to your photographic writers, who form a considerable body, and will, no doubt appreciate your efforts as I do. . . . I find it good policy to keep a dark-room for free users of customers, and to cater well for their wants, even though it means a large outlay and much space."

ANSWERS.

H.W.S.—You can obtain a first-class 'platycyrtic' or "plakeiatic" lens, mounted for the price of fifteen shillings, C. Baker, 246, High Holborn, W.C., and them at this price, of three different powers, magnifying five, ten, and twenty diameters respectively. The lowest power is best for general botanical purposes.

G. A. T.—Weitmann.—There is a "Honey-" honeyuckle, possibly a Leycesteria (Capsifrustris). May be able to give you further information."

J. B. J.—"You are not likely to find any Lownds manufacturers of the "what you may mention. They are practically entirely produced in Lancashire, by the United Alkali Co. of Buncorn, Liverpool, and others."

G. Harvie.—The information required will be given in next week's Journal. We cannot undertake to reply to queries by post.

COMMUNICATIONS, LETTERS, Etc., have been received from Messrs. Bethune, Butler, Coul, Cracknall, Grose, Hall, Hardwick, Ireland, Millard, Naylor, Parry-Owen, Reid, Rogers, Smart, Thompson.
Notes.

A special meeting of the trade is to be held in the Memorial Hall, Albert Square, Manchester, under the auspices of the Manchester Pharmaceutical Association, on Wednesday afternoon, January 25, when the President of the Pharmaceutical Society is expected to deliver an address. Mr. and Mrs. Carteigh will afterwards be present, by invitation, at the Manchester Pharmacy Ball, particulars of which were published last week (see p. 550).

The Indian Medical Congress was opened at Calcutta on December 24, by the Viceroy, who spoke at some length regarding the progress of the medical science in India. The address was afterwards delivered by Surgeon-Colonel Harvey, Inspector General of Hospitals in Bengal. The Congress was closed on December 29.

A new method of soldering aluminium is said by Invention to have been suggested by Herr Naaman H. Kyeser, who states that he has soldered aluminium, without the use of any flux at all, by heating the metal and scraping the surface so as to remove the oxidising film until the metal is "tinned," when union takes place easily enough. The alloy used consists of tin 50 parts, silver 25, aluminium 25, and molten at 750°, but almost any tin solder will, if it is stated, serve equally well.

The name "argon" has been given to the new element stated to exist in the atmosphere, and, at a special meeting of the Royal Society on January 31, Lord Rayleigh and Professor Ramsay are to present their paper on the supposed new constituent, and the matter will then be discussed.

According to the Lancet, Lord Rosebery has consented to receive a deputation during January, which will address the Lord Mayor of London on the lines recommended by the recent Royal Commission.

The American Journal, Science, which was recently compelled to suspend publication on account of want of support, is to be recommenced with the new year under the control of a thoroughly representative editorial committee. Chemistry will be represented by Professor Remsen; Botany by Professor N. L. Britton; and Hygiene by Dr. J. S. Billings.

In the course of a lecture on science teaching recently delivered by Mr. H. G. Wells at the College of Preceptors, and published in the Educational Times, the lecturer pointed out that a rational course of science should grow naturally out of kindergarten, followed by object lessons properly. The broad basis of physics and chemistry, led up to this, is described as the only valuable preparation for a scientific calling that can be given in a secondary school.

The members of the Chemists' Assistants' Association inaugurate their proceedings for the coming Half-Session with a Smoking Concert, to be held on Wednesday next, 9th inst., at the Hohe Shoe Hotel. Mr. T. Tyrer, F.C.S., F.I.C., is to take the chair at 8 p.m. Tickets (1s. each) are obtainable from the Secretaries, 103, Gt. Russell St., W.C.

The Trustees of the New York Pharmaceutical Club held their first dinner at their handsome club-rooms, 27, East Nineteenth Street, on Wednesday, November 21. The President, Mr. Bell, briefly set forth the objects of the club and its aims, and stated that the membership was increasing so rapidly, and that they were receiving new members on their own application, that before many months they hoped to be in their own club-house. The officers of the club are Robert J. Bell, President; John W. Buchalter, Vice-President; Frank A. Barnes, Treasurer; Valie A. Wood, Secretary.

A social meeting of the Midland Pharmaceutical Association was held at Birmingham, on Thursday, December 18. There was a goodly muster of members present, and an enjoyable evening was spent. The "Chat on Trade Topics" was deferred to a future meeting.

The resignation of Sir Henry Acland as Regius Professor of Physics at Oxford took effect with the close of the year, after he had held the chair for thirty-six years. It has been resolved to commemorate his services to the University and the city by some permanent memorial. This will take the form of a special fund of £10,000, to be used as a permanent endowment of the Sarah Acland Home for Nurses, founded in memory of Sir Henry's wife.

Mr. W. Spencer Turner was the recipient of a very handsome marble timepiece and an address, presented to him by the students of the Manchester College of Pharmacy in token of the high respect and esteem in which he is held by them, on his retiring from the directorate. The College will in future be conducted by Mr. Charles Turner.

The Scientific American reports that a New York citizen has placed 30,000 dollars at the disposal of the Health Department of the city for the purpose of providing an adequate supply of anti-toxin serum. Several spurious concoctions have recently been placed upon the American market as anti-toxin serum, and steps are being taken by the Board of Health to supervise the sale of the preparation.

In the Urban District Council election at Llanelly, Carmarthenshire, Mr. Evan Jones, chemist and druggist, was one of the successful candidates for No. 3 Ward.

Mr. Henry Morgan Davies, chemist and druggist, has been elected an Urban District Councillor, in the Liberal interest, for the Western Ward of Blaenavon, Monmouthshire.

Mr. E. B. Ford, pharmaceutical chemist, Pontypool, was at the head of the poll both in the local Urban District Council election and at the election of guardians for Pontypool.

Mr. Vincent A. Wills, chemist and druggist, has been elected a guardian of the poor for the district of Gytarthis, in the Merthyr Tydvil Union.

Among the successful candidates at the Parish Council election at Langbarne is Mr. John Johns, chemist and druggist.

Mr. John Evans, J.P., chemist and druggist, headed the poll in the Urban District Council election at New Quay, Cardiganshire.

Mr. A. E. Evans, chemist and druggist, has been elected an Urban District Councillor for the South Ward of Brynmawr.

Mr. E. J. Allen, who was a pupil of Prof. Schultz, of Berlin, has just been appointed director of the marine biological laboratory at Plymouth, in succession to Mr. E. J. Bles.

Messrs. Mackey, Mackey and Co. announce their removal from Bouverie Street to 176, Grange Road, Bermondsey.

"Natural Mineral Waters—their Properties and Uses," a pamphlet published by Messrs. Ingram and Boyle, Farrington Street, E.C.; has now reached its tenth edition, having been revised and enlarged. The analyses of the various mineral waters which are recorded in the pamphlet should prove of use for reference purposes by druggists and medicinal men, and should also the index and appendix in which the names of the springs are arranged in alphabetical order, and the properties and uses of the waters given in parallel columns.

As evidence of the recent excessive mildness of the season it is reported that a swarm of bees occurred on a Lincolnshire farm during the latter part of December.

A correspondent of Nature suggests the word "solute" to express the dissolved substance in a solution.
Legal and other News.

HORSE POISONING AT SPALDING.—At the Petty Sessions on Tuesday, December 18, Tom Harry Rhodes, farm servant, was charged with administering vitriol and salcon to five mares belonging to Mr. Thomas Atkinson, farmer, of Postland, and was further charged with stealing a sack of corn from Mr. Atkinson, both offenses being during this month. The evidence showed that defendant had got a large quantity of poisonous drug—vitriol, antimony, green salcon, etc.—and had been systematically giving them to five valuable mares belonging to Mr. Atkinson. He was also found to possess a bunch of straw, which we understand most of the doors were on his master’s premises. During last year Mr. Atkinson had had three very valuable horses poisoned by arsenic, administered by his horseman.—The chairman very severely censured defendant, and sentenced him to a month’s imprisonment with hard labour for each offence.

Nottingham Guardian.

Theatrical News.—Messrs. POTTER and CLARKE.—A fire broke out early on December 30 at Raven Row, Spitalfields, E., upon the premises of Messrs. Potter and Clarke, botanic drugists. The property first attacked comprised a range of buildings of two floors, used as a laboratory and store, the fronts originating on the ground floor. The firemen from the Commercial Road East Station were called up. The doors were burst open, and the firemen set a powerful hydrant and two steamers to work, with such excellent effect that an admirable “show” was put up. The flames had penetrated to the roof, but although the entire building was very seriously damaged, it was saved from total destruction.—Echo.

ALLEGED ATTEMPTED SUICIDE AT A HOSPITAL.—On Saturday, December 28, Mary Jane Price, aged 30, a native of Glamorganshire, was admitted to the Queen’s Hospital, Birmingham, suffering from the effects of a quantity of digitalis. Miss Price had been suffering from severe heart disease for some months, and on recovering she remained as a servant. On the Saturday morning she asked the matron, had occasion to represent her about the way she was performing her duties. Shortly afterwards Price took a booklet containing digitalis out of a cupboard in the surgery and swallowed the contents. She was removed to the Queen’s Hospital, and after the usual remedies had been resorted to she was detained.—Birmingham Post.

New Drug Companies Registered.

CRARNS and BROWN, LIMITED.—Registered by Robins, Cameron and Co., Gresham House, E.C., for Bateson, Warr and Bateson, Liverpool, with a capital of £2,100. Object: To carry on the business of ship’s store dealers, general provision dealers, shipping and export agents, and dealers in all kinds of stores, preparations, articles and things, including paints, oils, chandlery, sails, wines, spirits, beer, pharmaceutical and medical preparations, and articles suitable, or likely to become suitable, for the purposes of shipping or export or for use on board ship, or in connection with the transit of goods and passengers by land or sea.

ATHERTON DRUG COMPANY, LIMITED. —Registered December 14. Capital £2,000, in £2 shares. Object: To acquire, take over as going concern and carry on the business of a druggist and drysalters, the vending of patent medicines and sundries, and the dispensing of drugs now carried on by Henry Attheron, at 9, Market Street, Wigan, as “The Wigan Drug Stores.”

Matrimonial News.

Richardson—Anarchina. On June 20, 1894, at St. George’s R.C. Church, Carlton, Victoria, by the Revd. J. H. O’Connell, William N. Saunders Richardson (late of King’s Lynn, Eastbourne, and Clifton), son of the late John Kelly Richardson, of St. Johns, Antigua, W.I., to Ruby, fourth daughter of Walter Wallace Anarchina, of Hobart, Tasmania.

Press Comments.

The chief moral deodcable from the case of suicide in Nightingale Valley, Portohed (see Pharm. Journ. p. 579), is that the traffic in narcotics and other poisonous drugs ought to be stopped. The death of Mr. Atkinson was a sad and unbecoming example of the pernicious habit to which De Quincey was a slave. In fact, in the course of an inquest not long ago it was testified that a child had been from its earliest years doted with laudanum. All this is very unsatisfactory, and there is a general impression that the restrictions should be tightened to make it extremely difficult for unqualified persons to obtain laudanum in sufficient quantity to destroy life. There are, no doubt, some difficulties in the way of reform, but they surely should not be insurmountable.—Western Press.

THE WORD “SCIENTIST.”—In the December number of Science Gossip a protest was entered against the use of the word “scientist,” which was invented and explained by Whewell in his “Philosophy of the Inductive Sciences,” 1840, and the Times now quotes opinions on the point. Professor J. H. Michie, The Duke of Argyll, Sir John Lubbock, Lord Rayleigh, Professor Huxley, and Dr. Albert Günter unreservedly condemn the word. Sir John Lubbock suggests instead “philosopher” and “naturalist.” Lord Rayleigh proposed to revert to the wider meaning of “naturalist.” Dr. Günter sarcastically suggests that “scientist” might advantageously be reserved to denote the modern dabblers in great scientific questions. Mr. Grant Allen, while condemning the word, argues that, as languages grow irresponsibly, it is pedantry to object to a new word when it is used by a majority of persons. After the canons of sociology and “altruism,” “scientist” is a comparative gnat. Professor J. H. Michie that “scientist” must be “about as pleasing as ‘electroon’ to any one who respects the English language. Professor A. R. Wallace alone views the word with compunction; he even describes it as “useful,” and argues that, since we have “biologist,” “zoologist,” “geologist,” “botanist,” “chemist,” “physicist,” “physiologist,” and “specialist,” “we might as well use ‘scientist.’” He asks what there is to use instead, and expresses the opinion that it is too late to object to the word now.

New Books and New Editions.

[Sweet-scented flowers and fragrant leaves. By D. M'Donald. (Samson Low and Co., London.)]

Lessons in Elementary Science. By H. Major. (Blackie and Son, London.)
Novelties.

[Under this heading it is proposed to publish, from time to time, descriptions of new appliances and apparatus, and other novelties of interest to pharmacists. In submitting such articles for notice, full particulars should be sent, accompanied, if possible, by a block of suitable size for the Journal columns.]

DIAGNOSTIC MICROSCOPE.
This instrument has been made by Mr. Charles Baker, of High Holborn, W.C., at the suggestion of Surgeon-Major R. Ross, of the Army Medical Department, for diagnosing cases of malaria fever, etc. It has a sliding tube coarse adjustment, and micrometer screw fine adjustment, square stage of sufficient size to allow any portion of a seven-eighth inch cover-glass mounted on a 3 by 1 inch slip to be examined. It is fitted with a substage condenser, one-twelfth oil immersion objective, and eyepiece, the combination giving a magnification of 700 diameters. The body can be used at a length of 160 Mm. but closes to 100 Mm. to facilitate packing. The instrument is fitted in a solid leather case, six inches by three inches by three inches, with shoulder-strap and loops to fit to military belt. A few glass slips and cover-glasses, also a bottle of cedar oil and a bleeding-needle are packed in the case.

CHRISTIA BACKED LINT.
By a new application of the now well-known "Christia," Messrs. Thomas Christy & Co., of Lime Street, E.C., have been able to prepare an improved material, unaffected by oil, grease, spirit, chloroform, and hot or cold water. It is highly recommended for the application of linimentum chloroformi, chloroformum belladonae, and all other remedies which would soil clothing or destroy ordinary waterproof substances. By preventing the too rapid evaporation of the application, the backing tends to keep the lint moist.

LIQUID SULPHURATED HYDROGEN.
Liquid sulphurated hydrogen compressed into specially prepared steel cylinders as shown, each containing one pound of liquid, equal to about 11 cubic feet of gas at atmospheric pressure, is now supplied by Messrs. Baird & Tatlock, Cross Street, Hatton Garden, E.C. The cylinders have been tested to 1,500 lbs. per square inch, and the pressure when filled with liquid H2S never exceeding 500 lbs. per square inch. The valve has been specially designed in view of its use in chemical laboratories, and will be found to be absolutely tight. The gas is pure and dry. Compressed H2S is said to be much more economical in use than the present method of generating it from sulphide of iron. It is decidedly more cleanly, and always ready for use. It can also be supplied in larger cylinders up to 25 lbs., and it is proposed to supply other gases for laboratory use in the same form.

STRINGES FOR ANTITOXIN INJECTIONS.
Hypodermic syringes, as illustrated, are now offered by Messrs. Baird & Tatlock for injecting antitoxin in accordance with the system of serum-therapy. They are made in four sizes, containing one, two, five, and ten cubic centimetres respectively, the largest size being more especially employed for antitoxin injections. They are sent out in plush-lined cases, and, as they are fitted with asbestos washers, and all parts unscrew, they are easily sterilised.
Diary of the Week.

[Notices for insertion under this heading should reach the Editor on or before Wednesday.]

MONDAY, JANUARY 7.
London Institution, at 5 p.m.
"The Netherlands, a Geographical Study" (Illustrated) by H. J. Mackinder.

Society of Chemical Industry (London Section), at 8 p.m.
"An Investigation of the Natural Solidified Sodium Sulphate Lakes of Wyoming, U.S.A.,” by Dr. D. Harvey Attieal.

TUESDAY, JANUARY 8.
Pharmaceutical Society of Great Britain.
Benevolent Fund, Finance, and General Purposes Committee.
Preliminary Examination.
Royal Institution of Great Britain, at 3 p.m.
"The Electric Current working as a Power," by Professor J. A. Fleming.
Aberdeen Chemists' and Druggists' Assistants' and Apprentices' Association, at 9.30 p.m.
Circular, opened by Messrs. Forbes and Royal.

WEDNESDAY, JANUARY 9.
Pharmaceutical Society of Great Britain.
Council Meeting.
Edinburgh Chemists', Assistants', and Apprentices' Association, at 9.15 p.m.

Opening Meeting, conducted by D. McEwan.
Sheffield Pharmaceutical Society, at 8.30 p.m.
"The Morose or a Pharmacy," by J. Austin.
Imperial Institute, at 8.30 p.m.
Smoking Concert.
Royal Colonial Institute.
Society of Arts, at 7 p.m.
"Waves and Ripplnes," by Professor C. V. Boys.
Chemists' Assistants' Association, at 8 p.m.

The British Chemist at the Horse Shoe Hotel.
Plymouth and District Chemists' Association.
Special Meeting at the Foresters' Hall, at 2.30 p.m.,
to pass the revised rules.

THURSDAY, JANUARY 10.
School of Pharmacy Students' Association, at 7 p.m.
"Vinegar," by W. H. Maunz.
"Electricity as related to Chemistry," by F. F. A. Tunbridge.
Glasgow Pharmaceutical Association, at 9.15 p.m.
"Laboratory Notes and Suggestions for the Revised Pharmaceutical Textbook," by T. Dunlop.
Liverpool Pharmaceutical Students' Society, at 8.30 p.m.
Annual Dinner.
London Institution, at 6 p.m.
"The use of Water and Waves of Light," by A. P. Laurie.
Imperial Institute, at 4.30 p.m.
"Gems, and how to distinguish them," by H. A. Miers.

FRIDAY, JANUARY 11.
Sheffield Microscopical Society, at 8 p.m.
Practical Evening at the Medical School.

Patent Office Business.

APPLICATIONS FOR PATENTS.

Where complete Specification accompanies Application, an answer is given.

No. 22,940.—Henry Gregory and Frank Smith, 4, Corporation Street, Manchester.—Improvements in, and connected with, stockings, knee-caps, and the like. November 26, 1894.

No. 20,307.—Issac Diamond, Francis Braidwood, Thames Street, Greenwich, London.—An adjustable catch and cross-bar attachment for retort mouthpieces and other purposes. November 26, 1894.

* From the Illustrated Official Journal (Patents).

No. 22,858.—James Workman Walker, 87, St. Vincent Street, Glasgow.—Improvements in obtaining a continuous supply of hydrochloric acid or nitric acid gas, and in utilizing said sulphates. November 26, 1894.

No. 22,854.—William George MacIvy and the Princess Company, Ltd., 1, John Street North, Marylebone Road, London.—Improvements in tea and coffee making, and the like. November 26, 1894.

No. 22,855.—Hermann Clark Haycraft, 48, Breakspears Road, Brockley, London.—Instruments for measuring the frequency of alternating or periodically varying electrical currents. November 26, 1894.

No. 22,863.—William Garroway, 115, St. Vincent Street, Glasgow.—Improvements in the manufacture of chromates and of nitric acid. November 26, 1894.

No. 22,866.—Richard Bader, Worston, near Clitheroe, Lancashire.—Improved sieve for cleansing meal and other liquids. November 26, 1894.

No. 22,865.—William Oliver Rogers, 9, Berjeant's Inn, Fleet Street, London.—An improved ventilated lamp reflector. November 26, 1894.

No. 22,786.—Joseph George Hewson, 276, Hyde Road, Manchester.—Inhaler. November 26, 1894.

No. 22,836.—Radley Mott Trills, Egyptian Lodge, Val Planteant, Jersey.—Electric arc lamp. November 26, 1894.

Unclassified Advertisement.

WANTED for Caægita.—An ASSISTANT with first-class experience. Age between 23 and 28. Single. Must have passed the Minor examination. Passage paid. Address, with full particulars of experience, &c., to C. H. E. M., Messrs. Deacon's, 154, Leadenhall St., E.C.

Notices.

* * * Advertisements must be sent to Street Bros., 5, Savile Street, Lincoln's Inn, W.C., where copies of the Journal may be purchased, and instructions from Members respecting the transmission of the Journal to the Secretary.—Mr. Richard Bremridge—17, Bloomsbury Square, W.C.; otherwise delay may be caused.

Communications should reach the Editorial Department, 17, Bloomsbury Square, W.C., not later than the first post on Wednesday, if publication is desired in the next issue of the Journal; though prompt publication cannot always be guaranteed.

Matter intended for publication must be written in ink, on one side of the paper only, and be authenticated by the name and address of the writer; not necessarily for publication, but as a guarantee of good faith.

No notice can be taken of anonymous communications, and contributors are requested, as far as possible, to append their full signature instead of 'pseudonyms, a greater value being thus given to any opinions expressed.

To ensure accuracy, all chemical formulae, and scientific and proper names, should be written or printed with extra care; whilst if names, of plants and animals are underlined, and generic names alone commenced with capital letters, which inconvenience will be obviated.

When Illustrations are necessary, pen and ink drawings, consisting entirely of clean and sharp lines—and, preferably, twice the required size—must be supplied not later than a week before the proposed date of publication.
Notes.

The Chemists' Ball takes place on Wednesday next, January 16, at the Portman Rooms, Baker Street, W., and the pharma- cists interested in the Benevolent Fund are reminded that the surplus receipts at the Ball are paid over to the Fund. Application for tickets (ladies', 12s. 6d. each; gentlemen's, 17s. 6d.) should be made without delay to the Honorary Secretary, A. J. Phillips, 166, Cromwell Road, South Kensington, S.W.

The first number of the Imperial Institute Journal appeared last week, and contains full particulars concerning the governing body and organisation of the Institute, together with special articles on commerce, agriculture, finance, Australian hardwoods, etc., reports of scientific investigations, and commercial and general intelligence.

The authorises at Kew have commenced to issue a series of hand-lists of collections of living plants in the Royal Gardens. The lists, of which the first contains a list of Polyneura, have been instituted by the Director, Mr. W. T. Thislton Dyer, F.R.S.

The New York Pharmaceutical Era will henceforth appear as weekly instead of a semi-monthly publication.

May, Roberts, & Co., Clerkenwell Road, E.C.; Lynch and Co., Alderagate Street, E.C.; and W. Sutton & Co., Chiswell Street, E.C., have just issued new editions of their price-lists of druggist's sundries, revised up to the present month.

According to the Medical Press, Prof. Demosthenes of Bucharest, recommends that all medical men who are in the habit of receiving fees at the bedside, should provide themselves with mental press that can be readily sterilised together with their contents, on returning home.

The first number of a new science weekly was published by Whittaker and Co., on January 3, under the title of the Technical World and Science and Art. It embodies the features of the two papers which have previously appeared under the separate titles, and deals with science, art, and technology from an educational point of view, in addition to containing articles on pure and applied science and art.

The Queen has approved the appointment of Dr. J. S. Burdon Sanderson, now Waynfield Professor of Physio- logy, to be Regius Professor of Medicine in the University of Oxford, in succession to Sir Henry Acland.

It is proposed to create two new degrees at Oxford University, Doctor of Letters and Bachelor of Science—which will be obtained by dissertationists who have passed the B.A. examinations, or can adduce proof of having received a good general education. They must also have given evidence of their fitness for special study or research, and that the course on which they intend to enter is such as may profitably be pursued at the University.

The Practitioner commences its fifty-fourth volume with a new editor—Mr. Malcolm Morris, M.R.C.S., and is now published by Messrs. Cassell and Co.

Science Progress for January contains the first part of an article on the structure and formation of coal, by A. C. Seward, M.A., Examiner in Botany to the Pharmaceutical Society. There is also an article on "Physiological Abortion," by Professor E. Waymouth Reid, and one on "The Coagulation of the Blood," by Professor W. J. Halliburton.

Mr. D. Dickinison, chemist and druggist, has been elected an Urban District Councillor for the East Ward of Hoole (Chester).

Mr. William Baxter, pharmaceutical chemist, Fording- bridge, Hants, having been elected on the local parish council, has since been elected vice-chairman.

Mr. R. A. Robinson, chemist and druggist, Brompton Road, S.W., was recently elected a member of the Kensington Vestry.

Mr. David Promser, chemist and druggist, Sheerness, was last week unanimously elected chairman of the Sheppey Board of Guardians, for the third time, and has also been elected a district councillor. He has been a guardian and a member of the Local Board of Health for nearly twenty-five years.

The Annual Assembly of the staff of Messrs. T. and H. Smith and Co., Edinburgh, took place on Friday, December 28, in the "Lodge of Edinburgh" Hall, 19, Hill Street. Mr. J. D. Mackenzie occupied the chair at supper, and Mr. W. R. Cunningham acted as M.C. There were about forty couples present, and a very enjoyable evening was spent, the proceedings being pleasantly varied by several songs.

An interesting paper on "Diphtheria and its Cure," by Sir Henry E. Roscoe, F.R.S., which concludes with an appeal on behalf of the British Institute of Preventive Medicine, appeared in The Speaker for December 29.

Mr. Jabez Spencer Balfour, the erstwhile M.P. for Burnley, in contributing an account of the customs and costumes of Salta to the Pall Mall Gazette, mentions that the male portion of society in that Argentine city habitually frequents some particular salons at certain hours where they sit for hours every evening talking and smoking.

A paper, "In Defence of Mattei-ism," by Mr. A. J. L. Gliddon, is contributed to the January number of the Humanitarian, edited by Mrs. Victoria Woodhall Martin.

The pharmacist appears in fiction in the current number of The Idler, where the troubles of Mr. Adam Chilver, Dispensing Chemist, West Kensington, with an aristocratic amateur burglar are amusingly depicted. The latter refuses to leave the premises, and makes himself at home whilst the proprietor goes to church, leaving on the table a few pamphlets he has written "for the use of young men." On Mr. Chilver's return, however, he finds his self-invited visitor has desecrated, leaving a note in which he says:—"Dear Chilver.—The tract did it. Dymate would couldn't have, but your pamphlets were too much. Do be more tolerant and charitible."

The Academy, in a short notice of an enlarged and revised edition of "The Rise and Development of Organic Chemistry," by the late Carl Schorlemmer, mentions that the labours of this distinguished man, which continued for a third of a century, will be commemorated by that institution. Very shortly the "Schorlemmer Laboratory" will be in working order and devoted to the study of that important and complex department of the science of which the author of the treatise referred to was so admirable an exponent and so indefatigable an explorer.

Another pharmacist has been distinguished by being appointed a Justice of the Peace (for the County of Middlesex), in the person of Major Cliford Probyn, of Grosvenor Street, W., who is also a member of the London County Council.

A case under the Pharmacy Act, 1888, was heard at Oldham County Court on Thursday, when W. Crompton, of 14, Market Place and 61, West Street, Oldham, was sued by the Pharmaceutical Society, for the sale, at the last address, of two bottles of Pown's balsam of analysed. Penalties claimed in respect of purchases made at the Market Place shop, had been paid into court last August. Defendant produced deed showing assignment of West Street shop to his brother twelve months ago. The Judge said defendant seemed to have obstructed the Pharmaceutical Society, and though in the case of West Street he must decide against the Society, defendant must pay full costs. A full report of the case will appear in next week's Journal.
Legal and other News.

[Readers are invited to send local information of pharmaceutical interest. When newspapers are sent the paragraphs to be noted should be plainly marked, whilst cuttings should be verified by the addition of source and date.]

A BELGIAN POISONING CASE.—The trial commenced on Monday, at the Assise Court, Antwerp, of Madame Joniaux, who, remarks the Sunday Times, if found guilty, will take her place by the side of Brinvilliers and other poisoners of orthodox methods. Madame Joniaux is supposed to have done away with her brother, Mr. Alfred Ablay, her sister, Mlle. Léonie Ablay, and her husband's uncle, M. Van der Kerehove, the motive being to obtain the insurance money payable at their deaths. The prisoner is the daughter of the Belgian General, Ablay, an aide-de-camp to King Leopold, and her first husband was M. Frédéric Faber, a book-collector, well remembered in London auction rooms. M. Joniaux, her present husband, is an engineer, but he is in no way implicated in the crimes laid to the charge of his wife. Morphine or atropine is alleged to have been the poison used. This part of the case would be very weak for M. Alfred Ablay was known to have been addicted to the morphine habit. Unfortunately for Madame Ablay, several chemists have come forward to testify that the prisoner did order morphine from them with a prescription intended for her husband. In return she ordered her own, in favour of the supposed criminal. Madame Joniaux has been in prison since April. She declares that she is innocent, and has written out a lengthy defence of herself.

SUICIDAL MANIA OF A SERVANT.—At the recent Worcestershire Quarter Sessions, A. Morris, alias Rigby (17), servant, was charged with attempting to commit suicide on Oct. 24 at the home of Mr. H. Todd, of Hougton. He was previously convicted of assault, and was sent to prison. When the police visited the house, it was found that the defendant had taken a bottle of patent lemon pills. He told the doctor she had been assaulted criminally. He believed prisoner suffered from suicidal mania. He wished to throw herself from the train on the way to Worcester. The jury sentenced the prisoner to be accounted for her actions at the time of the offence, and she was ordered to be detained during her Majesty's pleasure.—Birmingham Gazette.

CASE UNDER THE MERCHANDISE MARKS ACT.—At the Bristol police court, on December 30, the magistrates were engaged for some time in hearing charges against two men named Herbert Ashley and Alfred Horace Ashley, who were charged with obtaining money by false pretences, with applying a false trade description, namely, Hood's camaparilla tablets, and Hood's tonic pills, to certain goods which they sold; and with having in their possession goods for sale to which a false trade description was applied. After some conversation between the solicitor and the magistrates' clerk, it was understood that the defendants pleaded guilty to selling the pills and tablets, and having in their possession, the charges were then given, and, ultimately, the defendants were fined 10s. each on two charges and £2 each towards costs, making £5 in all. If the fines were not paid defendants would be imprisoned fourteen days. The magistrates also ordered all the goods and habiliments in the possession of the police to be confiscated.—Bristol Mercury.

DRINKING A BOTTLE OF CHLORODYNE.—At Swansea last week, Police-sergeant Lewis reported that a clerk at the Hafod Isha Works named W. H. Grove, living at Beech Street, volunteered the information that he had found a bottle of chlorodyne, which he had brought the bottle that day, as he had not been feeling well, but what caused him to empty the bottle he could not say, and he did not see his mistake till after he had swallowed it. The policemen arrived on the arrival of the police, as soon as he was removed to the hospital, where he is progressing favourably. Dr. Charles thinks the taking of the overdose was merely a foolish freak.—South Wales Echo.

FAILURE OF A CHEMIST.—At the Sunderland Bankruptcy Court, on January 8, before Mr. R. K. A. Ellis, John Aslin, chemist and druggist, Sunderland, was examined by the Official Receiver. His unsecured indebtedness is £20, and his assets are estimated at £25. He started business about 1854, and for the last few years he lived in the country, leaving the business to be managed by his son. His answers showed that he had not had any dealings from his son's estate, and anything was going wrong until urgently summoned to Sunderland in November last. His examination was adjourned for a fortnight.—Sunderland Herald.

FIRE AT A STOCKTON CHEMIST'S.—Early on Monday morning a fire took place in the shop of Mr. W. Clarke, chemist, High Street, Stockton. The smell of burning was discovered about 8.30 a.m. by P.C. Stephenson, of the North-Eastern Railway Company, who gave the alarm, and the fire brigade being soon on the spot the cupboard was speedily extinguished, though not before a large amount of damage had been done to the stock and fixtures, which, however, are insured. Mr. Clarke left the premises safe on Sunday night shortly before ten. He surmises that a mouse had got hold of a wax match, and nibbling it caused the fire.—Darlington Echo.

THE FOOD AND DRUGS ACT IN YORKSHIRE.—Mr. A. H. Allen, the Public Analyst for the West Riding of Yorkshire, says in a recent speech that during the quarter he examined fifteen samples of ground ginger, twelve of which were genuine. Of the other three samples one was of a suspicious character, one was adulterated with 30 per cent. of extracted ginger, and one contained about 10 per cent. of hydrated sulphate of lime. This existed in the form of fibrous gypsum, and, as Mr. Allen's opinion, must have been added intentionally. In his previous quarterly report, Mr. Allen said, with reference to a case in which Mr. Green had appealed to him, as a consequence of the position taken up by the referee, it is possible for 5 per cent. of warehouse sweepings or any other rubbish to be added to all ground ginger. It is the present report Mr. Allen goes on to say that one sample submitted to him was under the name of "linseed, liquorice, and chlorodyne looseges." This is an instance of a sample on which it is impossible to report satisfactorily. The sample appeared to contain an extract of liquorice, and structures similar to linseed were detected. The composition of chlorodyne is a trade secret, and the numerous imitations vary greatly among themselves. Mr. Allen says he was, therefore, quite unable to express an opinion as to the presence of chlorodyne in the looseges.

CHEMIST'S ASSISTANTS' ASSOCIATION.—A successful smoking concert was held by this Association at the Horse Shoe Hotel, on Wednesday last, when the chair was taken by Mr. J. B. Ward. An excellent programme had been arranged by Mr. R. H. Robbins, and was thoroughly enjoyed by those present. Amongst other guests were Professors Green and Greenish, Mr. W. Gove Cross, Mr. Richard Bremeridge, and Mr. Edmund White.

AN OLD PHARMACY AT SHEFFIELD.—The premises of Mr. G. T. W. Newsholme, pharmaceutical chemist, Market Place, Sheffield, are doomed to destruction. There are records to show that a similar business has been carried on in them for nearly 160 years, and, so far as can be ascertained, it has only changed hands three times in all that long and eventful period. About 140 years ago they were occupied by Mr. Jones; he was succeeded by Mr. Gillatt, and then came Mr. Radley, who was there close upon forty years. It seems that when seven years since the latter came into possession, and he, like his predecessors, has held is veneration the ancient front with its bow window and small panes of glass—the only front of the kind in the centre of the city. The corporation is wisely minded, and has to come down. Mr. Newsholme's interest in the lease has accordingly been purchased by the local authority, and he is to remove his trade fixtures and give up possession by July 1st next.
CARES OF POISONING BY ZINC CHLORIDE.—On Wednesday, December 11, a traveling agent named Nathaniel Smith, lodging in Union Street, Westone-Super-Mare, whilst in a semi-intoxicated state swallowed a quantity of solution of chloride of zinc in mistake for brandy. He was at once conveyed to the hospital, where emetics were administered, but he still remains in a critical state, suffering greatly from the corrosive action of the fluid. Westone-Super-Mare Gazette.

CHEMICAL WORKS IN BOSNIA.—In April last a company was formed, to be known as the First Bosnian Aromatic and Drug Company. The works of the company, which are situated at Lukar's, near Doboj-Tusla, are now completed, and were put in operation at the end of November.—Industries and Iron.

WESTMINSTER COLLEGE OF PHARMACY.—The students of the Westminster College of Pharmacy held a very successful smoking concert at the Foresters' Arms, Borough High Street, on Friday, December 25, the chair being occupied by Mr. H. C. Wootton. Mr. F. Kenton, the general body had the room tastefully decorated, and a very enjoyable evening was spent. During the evening Mr. Bryant proposed "The Westminster College of Pharmacy." The toast was well received, and responded to by Mr. Punch. The toasts followed to the "Sacred to the Danube" and the "Forthcoming Examination," proposed by Mr. Ayre, and responded to by Mr. Williams. At the close the usual votes of thanks were accorded the chairman and artists.—South London Press.

CASE UNDER THE MERCHANTS' MARKS ACT.—At the Guildhall Police Court, Nottingham, on January 7, Benjamin North, wholesale druggist, of St. James's Street, was summoned for selling a barrel of vinegar to the defendant, who afterwards sold the same to a retailer. The vinegar was not under the description (that of Poampas and Co.), within the meaning of the Merchandise Marks Act of 1897, as affixed. The evidence showed that the defendant had supplied vinegar of another make to Tompioned and Co.'s barrel. Tompioned, however, was covered by defendant's labels. The magistrates felt that an offence had been committed within the meaning of the Act, but thought that it might be of a technical rather than of an intentional character. Defendant was fined 20s., without costs.—Nottingham Guardian.

Press Comments.

Dr. Burdon Sanderson, who has been appointed to succeed Sir Henry Acland as Regius Professor of Medicine at Oxford, was already Waynflete Professor of Physiology in the same University. Professor Sanderson's reputation is European, the value of his scientific work has been universally acknowledged, and the Prime Minister has heartily approved his appointment. But great regret will be felt by many generations of Oxford men, as well as in Oxford itself, at the retirement of Sir Henry Acland. Sir Henry, who will be eighty this year, has been so long a picturesque and familiar figure at Oxford that the memory of man runneth not to the contrary. His speeches in Convocation were models of academic oratory, stately, sonorous, and ornate. His fine pre-eroes, his deep voice, and his mellifluous flow of personæ anecdote belong to the features of the place. He is included in the select body of honorary students at Christ Church, among whom Lord Salisbury and Lord Rosebery are the latest recruits. The first three on the list are Mr. Gladstone, Mr. Raikes, and Sir Henry Acland. In 1884 Mr. Gladstone made Dr. Acland a Knight of the Bath, and in 1890 Lord Salisbury made him a Baronet. He has always been an earnest advocate of medicine and all parties that Oxford would hardly seem itself if his genial and pleasant company were withdrawn from it.—Daily News.

"Journalism in Japan" is the subject of an interesting article by a Japanese in the Bangkok News. Our Paris correspondent writes:—"The writer, Mr. Mototsu Saito, for several years settled in France, has brought out on the stage here Japanese plays turned into French. The author of journalism is the Hon. Sun was a chemist—that is to say, of the pharmaceutical order—named Kishida-Chinku, who issued some twenty-five years ago a periodical sheet to spread the praise of his medicines. It came out twice or three times a month. Politics he was forbidden by law from touching; but in order to make his circular more interesting, he introduced into it society paragraphs and sensational police cases, and even serial stories from national legends. Still, journalism published in Japan, instead of being conducted by pre-sees, when it fast became prosperous. Kishida-Chinku was, however, ruined by competition. The Japanese have now upwards of four hundred dailies, costing a halfpenny or a penny, and something like three hundred reviews or magazines.—Daily News.

Missouri chemists are preparing to hold a smuggling contest at the annual meeting of the State Pharmaceutical Association next spring. That competitor who can name the greatest number of drugs by smelling them will carry off a cash prize of £20. It will probably be the first contest of the sort ever held, though druggists have always recognised the value of a well-trained nose in determining the nature of chemicals. Pharmacists are interested and amused over the smuggling contest. There are few drugs, common or rare, that are not locally odorous, and the test of smell is a recognised one among all pharmacists. A chemist must have a good nose. The odour of drugs is part of the test in all pharmaceutical colleges.—Massco.

The losenge of every-day life has hitherto been looked upon as a harmless, if unnecessary, compound. Such will be the case no longer, after the behaviour of one of the chlorate of potash family. It belonged to a man who smoked. What he smoked there is no evidence to show. Whatever it was, it made his tongue sore. He employed the losenge to look after his tongue. He believed in it implicitly, and carried it about, quite loose, in his waistcoat pocket. The losenge repaid his confidence by making a pocket-volcano of the pocket; and the man was in a fair way to obtain a practical experience of cremation, when they threw a pall of water over him and put him out. Of course, he was very much put out. He had not expected this of the losenge, and he could not understand it. Science has had to explain. In the same pocket with the losenge the smoker carried a box of matches. They were not ordinary matches, but no one can explain what they were. They were safety matches. But they were made of chlorate of potash, like the losenge; and they go off only on the box because they are there; they are the phosphorus to go off upon. The chlorate of potash losenge found the phosphorus. There was the rub. The losenge went off; the matches flared up. The conflagration became general. For the future this smoker will have to keep his losenge under proper control, or, better still, smoke something that does not induce sore tongue. In any case, all new fire insurance policies are likely to contain a losenge clause.—Pall Mall Gazette.

New Drug Companies Registered.

LONDON AND SUBURBAN PEST DRUG COMPANY, LIMITED.—Capital £2,000 in 21 shares. The object of this company is to supply London and the suburbs with drugs and patent medicines at 'cash prices.'

WILLIAM HAY, LIMITED.—Capital 200,000, in 210 shares. Objects: To acquire, take over as going concerns, wholesale and retail, the business of wholesalers and druggist, and manufacturer of and dealer in aeronaut and mineral waters, and soluble essences, carried on by William Hay, at Kingston-upon-Hull.
Diary of the Week.

[Notices for insertion under this heading should reach the Editor on or before Wednesday.]

MONDAY, January 14.

Imperial Institute.
House Dinner, at 6.45 p.m.
"Adventures and Incidents in Africa," Illustrated by F. C. Selous, at 8.30 p.m.

London Institution, at 5 p.m.
"The Use of the Supernatural in Art," by Wyke Bayliss.

Society of Arts, at 8 p.m.
"Discovery of the Electric Arc Light," by Professor Silvanna F. Thompson.

TUESDAY, January 15.

Royal Institution of Great Britain, at 8 p.m.
"The Internal Framework of Plants and Animals," by Professor C. Stewart.

WEDNESDAY, January 16.

Pharmaceutical Society of Great Britain.
Library, Museum, School, and House Committee.

Imperial Institute.
Concert Dinner, at 6.30 p.m.
Ladies' Concert, at 8.30 p.m.
Royal Microscopical Society, at 8 p.m.
Annual Meeting, postponement by the President.

Society of Arts, at 8 p.m.
"Commercial Synthesis of Illuminating Hydrocarbons," by Professor Vivian B. Lewis.
Edinburgh Chemists' Assistants' Association, at 9.15 p.m.
Open Meeting, postponed from January 9.
Manchester Pharmaceutical Association, at 7.30 p.m.
(Botanical Lecture illustrated), by Charles Turner.

THURSDAY, January 17.

Chemical Society, Burlington House, at 8 p.m.
"Acid Sulphate of Hydroxyamine," by Dr. Divers.
"Mercury and Bismuth Hypophosphites," by S. Hada.

Imperial Institute, at 4.30 p.m.
"Decorative Building Stones," by F. W. Budler.

Royal Institution of Great Britain, at 8 p.m.
"Four English Humorists of the Nineteenth Century," by W. S. Lilly.
London Institution, at 6 p.m.
"Four English Humorists of the Nineteenth Century," by W. S. Lilly.
"Nerves and Nerve Centres in Action" (Illustrated), by Henry Power.

Linnean Society of London, at 8 p.m.
"On some Variations in the number of Stamen and Carpel," by I. H. Burkitt.

Chemists' Assistants' Association, at 8.30 p.m.

Liverpool Chemists' Association, at 7 p.m.
Annual Meeting. Inaugural Address by the President.

Society of Arts (Indian Section), at 4.30 p.m.
"The Land and the Men they live in," by Captain John Shakespear.

FRIDAY, January 18.

Royal Institution of Great Britain, at 8 p.m.
"Phosphorescence and Photographic Action at the Temperature of Boiling Liquid Air," by Professor Dewar.

Queckett Microscopical Club, at 8 p.m.
Ordinary Meeting.

SATURDAY, January 19.

Royal Institution of Great Britain, at 5 p.m.

Patent Office Business.

APPLICATIONS ABANDONED BY APPLICANTS.
No. 550.—A new or improved ointment for human use.—Elizabeth Gregory, n. 1, East Parade, Leeds. Date of application, January 10, 1894.
No. 562.—A medicine for the human body.—Charles Edward Brading, 61, Bedford Road, Ilford. Date of application, January 15, 1894.
No. 1407.—A preparation for medical use.—Joseph Hartley Rhodes, 19, Bowling Green Street, Leicester. Date of application, January 25, 1894.

APPLICATIONS FOR PATENTS.
Where complete Specification accompanies Application, an asterisk is suffixed.
No. 28,895.—David Henderson Houston, 55, Chancery Lane, London. Improvements in photographic camera. November 25, 1894.
No. 28,916.—Sydney Pitt, 84, Southampton Buildings, Chancery Lane, London. The production of fast yellow dyestuffs from the sulpho azide of dehydrotrinitro- toluidine or analogous bases (Leopold Cassella & Co., Germany.) November 26, 1894.
No. 28,919.—Thomas Barnet Grant, 15, George Street, Mansion House, London. An electrically driven hydro-extractor. November 26, 1894.
No. 28,936.—Andrew George Adamson, 154, St. Vincent Street, Glasgow. Improvement in, and connected with, the developing of photographs. November 27, 1894.
No. 28,861.—Thomas Blake, 8, Quality Court, Chancery Lane, London. An improved polishing liquid for polishing metals. November 27, 1894.

Unclassified Advertisements.

EXPERIENCED qualified Assistant wanted, for light Retail and Dispensing. 25 to 30. Must be an accurate Dispenser and well recommended. Comfortable permanency to suitable man. Particulars to Goulud, Chemist, Toddington.

WANTED immediately.—A smart, gentlemanly Assistant, not under 25 years, in an old-established Dispensing and Prescribing business, for improvement. Near Bloomsbury Square. Height about 5 ft. 8 in. Non-smoker preferred. Personal interview if possible. Chemist, 60, Lamb's Conduit St., W.C.

MECHANICAL ASSISTANT, used to first-class work, plate, vulcanite, contiguous gum, &c. Salary 50s. 11, Shakespere St., C-on-M., Manchester.

* From the Illustrated Official Journal (Patents).
Notes.

BIOLOGY NOTES.—The Technical Instruction Committee of the Essex County Council is publishing a monthly pamphlet, entitled 'Biology Notes,' in connection with the scheme for establishing a systematic course of scientific instruction in biology in the district. Lectures on plant diseases, etc., are given under the direction of Mr. Houston, and practical courses of study are conducted at the Chelmsford Laboratory, where also agricultural problems are fully considered.

THE EXTRA PHARMACOPOEIA.—Mr. H. K. Lewis, of Gower Street, announces that a new edition of Martin- dale and Westcott's 'Extra Pharmacopoeia' is in course of preparation.

EDUCATIONAL WORK AT HOME AND ABROAD.—A new post has been created under the Education Department for the purpose of obtaining special information and issuing special reports, from time to time, in relation to educational work at home and abroad. The first 'Director of Special Enquiries and Reports,' as the new officer is to be styled, is M. E. Sedler, Student of Christ Church, and Secretary of the University Extension Delegacy at Oxford.

SEBOTHERAPY AT THE PASTEUR INSTITUTE.—The Pasteur Institute, Paris, has, according to the Lancet, received up to the present £24,440 to enable the authorities to provide a supply of antiseptic serum. The French Chambers have also voted £4000 for the same purpose. A stud of 136 horses is now kept, and arrangements have been made for the immediate despatch of tubes of serum to any part of France.

SILVER MEDAL FOR A SCIENCE STUDENT.—The silver medal given by the Mayor of Kendal (Mr. Wm. Bindloss) for the best science student of the year 1894, at the local School of Science and Art, has been awarded to Albert Storrs Walker.

BUSINESS CHANGES.—Messrs. Joseph T. Preston and Alfred Preston have retired from the firm of Thos. Hodgkinson, Prestons, and King, of 81, Bishopsgate Street Without. The remaining partners, Messrs. J. Classon Preston, Herbert E. King, and Alfred Chas. Preston, will in future carry on the business under the same style as formerly.

BEESWAX AS A DRUG.—In a case heard at the South-Western Police Court, Mr. Denman has decided that beewax sold at a drug store is to be regarded as a drug, and being therefore within the scope of the Adulteration Act, the presence of 50 per cent. of paraffin in an article sold under that name, constituted an offence against the Act. On those grounds Day's Southern Drug Company was subjected to a fine of 40s. with £3 3s. costs.

EDINBURGH PHARMACY BALL.—The Edinburgh Chemists' Ball is to take place in the Masonic Hall, George Street, on Thursday, 24th inst., at 9 p.m.

DIRECTORSHIP OF FORESTS AND GARDENS.—The Athemerus is glad to learn that the ill-advised scheme for destroying the post of Mr. H. N. Ridley as Director of Forests and Gardens to the Government of the Straits Settlements has broken down. Not only would the abolition of this scientific post have been a mistake, but the loss of Mr. Ridley would have been felt by every naturalist who has an interest in the flora or fauna of the region round Singapore.

BULLETIN OF PHARMACY.—In the December number of the Bulletin of Pharmacy a short biographical sketch is furnished of Professor Oscar Oldberg, Ph.D., Dean of the Illinois College of Pharmacy, who will henceforth act as editor of the paper.

APPOINTMENTS AND ELECTION RESULTS.—Mr. W. B. Edgeler, chemist and druggist, Petersfield, Hants, was returned at the head of the poll at the recent election of urban district councillors, and has since been unaniomously elected chairman of the council. On Saturday last, also, he qualified as Justice of the Peace for the county of Southampton. Mr. R. H. Lowe, chemist and druggist, Wolverhampton, has been elected on the local Board of Guardians, with which he has been connected since 1873. Mrs. Annie Phillips, the wife of Ald. J. Phillips, pharmaceutical chemist, Wigan, has also been elected a Poor Law Guardian. Mr. Henry Peet, chemist and druggist, Mount Pleasant and Ranelagh Place, Liverpool, has been appointed a magistrate for the city of Liverpool. At the recent election for the Board of Guardians Mr. Peet was returned at the head of the poll. For the last ten years he has been a member of the Select Vestry, and during the last four years has been chairman of the Board.

TRADE MEETING AT MANCHESTER.—As already announced, the President of the Pharmaceutical Society will address a special meeting of the trade in the Memorial Hall, Albert Square, Manchester, on Wednesday afternoon next.

THE CHEMISTS' BALL.—The chemists' twenty-ninth annual ball, held at the Portman Rooms, London, on Wednesday last, was exceptionally successful, some 250 guests being present. The indefatigable T. C. W. Martin, as usual, acted as M.C., whilst the President of the Pharmaceutical Society once more took the chair at supper and referred in his customary happy style to the invaluable services rendered by the Honorary Secretary, Mr. A. J. Phillips. Mr. Cartelgh also went far towards disproving the notion that with increasing years comes lack of vigour, for his figure was prominent in almost, if not quite, every dance. Other Members of the Pharmaceutical Council present were Messrs. Martin and Warren, whilst Mrs. Cartelgh and Mrs. Martin set a good example to the ladies present in keeping the proceedings brisk. Amongst other official visitors were Major Probyn, J.P., L.C.C., Mr. T. H. W. Idra, L.C.C., Mr. Richard Breemridge, Professor Greenhal, and Mr. Edmund White, the latter being accompanied by Mrs. White.
Manchester Pharmaceutical Ball.—The second annual ball and musical promenade in connection with the Manchester Pharmaceutical Association will be held in the Hulme Town Hall, Manchester, on Wednesday next, January 23. Applications for tickets should be made at once to the honorary secretary, A. Blackburn, 7, Exchange Street, Manchester.

A Lake of Glauber Salt.—At the last meeting of the Society of Chemical Industry, a paper by Dr. D. Harvey Attfield was read, in which he described a natural solidified sodium sulphate lake in Wyoming, U.S.A. This lake occurs in the oil district, is 1200 yards long, covers about 110 acres, and consists of a solidified mass of practically anhydrous sodium sulphate, with 6 p.c. of carbonate, 1-5 p.c. of chloride, and 69 p.c. of water of crystallisation.

Compressed Drugs.—The Practitioner suggests, with regard to compressed drugs, that the prescriber's aim should not be to get every prescription into tablet form without considering whether his therapeutic object in certain cases will not be better attained by ordering his remedies in a liquid form.

The 'Practitioner.'—The new editor of this medical publication has introduced certain new features into it, which render it more attractive from a purely literary point of view. It will now deal with "Practical Medicine" in the widest sense of the term, and there will be an article summarising and commenting on the medical events of the month as well as a "medico-literary casuistry," a short summary of matters relating to public health, and "practical notes" on diagnosis and treatment. The readers of the Practitioner are to be congratulated on the general improvement manifested.

New Botanical Works.—Amongst announcements of forthcoming books are "Fossil Plants, a Manual for Students of Botany and Geology," by A. C. Seward, M.A., F.G.S., one of the recently appointed Examiners of the Pharmaceutical Society; and "Elements of Botany," by F. Darwin, M.A., F.R.S. They will form part of the Cambridge Natural Science Manuals issued by the Cambridge University Press.

Society of Public Analysts.—The annual dinner of this Society, which will attain its majority in a few months, was held on Wednesday at the Criterion Restaurant, London. The chair was taken by Dr. Thomas Stevenson, the newly-elected President, who spoke in hopeful terms of the present position and future prospects of the Society. Dr. Stevenson was one of the six founders of the Society of Public Analysts, and, as is well-known, is Scientific Analyst to the Home Office and Government Visitor at the Pharmaceutical Society's examinations.

Death of Mrs. Hopfer.—On Monday last, Mrs. William Hopfer, widow of a Founder of the Society, whose death was so recently recorded, died at the age of 91, at Camborn Lodge, Surbiton Hill Park.

Legal and other News.

[Readers are invited to send local information of pharmaceutical interest. When newspapers are sent the paragraphs to be noted should be plainly marked, while cuttings should be verified by the addition of source and date.]

Fire at Burroughs, Wellcome, and Co.'s.—An outbreak of fire occurred on the night of January 10 upon the premises of Messrs. Burroughs, Wellcome, and Co., manufacturing chemists, at Snow Hill Buildings, Snow Hill, City. Prompt action of the brigade, however, saved the building from destruction, although considerable damage was done.

Pharmaceutical Society of Ireland.—At the January (quarterly) examinations, held at Dublin and Belfast, for licence to act as a registered druggist, the following passed:—Messrs. T. Batt, H. D. S. Corry, R. Hastings, S. H. McConway, and J. K. Miskelly, Jr. Two candidates were rejected.—Freeman's Journal.

Liverpool Pharmaceutical Students' Society.—The fifth annual dinner of this society was held a Thursday, January 10, at the Alexandra Hotel, Dale Street. Between sixty and seventy were present. Mr. R. H. Mitchell, the president, was in the chair and was supported by Dr. Nevins, Dr. Larkin, Dr. Logan, Dr. Symes, Mr. H. Peet, J.P., Mr. E. Davies, F.E., and Mr. Charles Sharp, F.L.S. "The Medical Profession," proposed by Mr. J. Shackleady, and responded to by Dr. Nevins, "The Pharmaceutical Students' Society," proposed by Dr. Symes and responded to by Mr. R. H. Mitchell; the "Pharmaceutical Society," proposed by Mr. F. Walker, and responded to by Mr. J. Smith; the "Visitors," proposed by Mr. R. C. Cowley, and responded to by Mr. Charles Sharp and Mr. H. Peet; "Our Musical Friends," proposed by Mr. J. E. Burt, and responded to by Mr. F. L. Josephs, were all heartily received. A long and interesting programme of songs, etc., was much appreciated, the principal contributors being Messrs. Frank L. Joseph, Paul Waring, A. Robertson Field, W. C. Kingdon, and E. Vaughan.

Food and Drugs Act Prosecutions.

The Sale of Tincture of Iodine.—At Brentford Petty Sessions, on Saturday, before General Tremensheere (Chairman), Sir George S. Messen, and Messrs. M. Sharpe, G. G. Mackintosh, J. Allen Brown, A. S. Montgomery, and other justices, Frederick Fresson, chemist and druggist, of High Street, Brentford, was summoned by Inspector W. Slyde, under the Food and Drugs Act, for "not having unlawfully sold to the said Walter Tyler, to his prejudice, a certain drug, to wit, tincture of iodine, which was not of the nature, substance, or quality demanded by the said Walter Tyler, it not being ordinary tincture of iodine as prescribed by the British Pharmacopoeia.'

The defendant appeared.

Inspector Tyler, in stating his case, relied on the statute in Knight v. Bowers, and said it was only necessary to prove that the tincture was either not of the nature, or substance, or quality demanded. He was conducting the prosecution with a view to teaching chemists that they must prepare drugs according to the standard of the British Pharmacopoeia; and that they must follow no other guide. To support this view he quoted the 54th section of the 21 & 22 Vict., requiring "the General Council to prepare a book, called the British Pharmacopoeia, in which the manner of preparation of medicines and compounds shall be laid down." He
admitted, however, that this section had not been incorporated into the Food and Drugs Act of 1875 (a subsequent measure), though, according to Bell, an unofficial sub-committee which framed the Act advised it should be.

The evidence showed that a sample of tincture of iodine was bought by the Inspector’s assistant and handed to the inspector, who, astonished at the light colour of the compound, asked if some mistake had not occurred. To the defendant he explained that there were two kinds of that particular tincture. The legal formalities were carried out, and the certificate of the analyst, Mr. E. Bevan, read: “The sample is not ordinary tincture of iodine as prescribed by the British Pharmacopoeia.” The defendant did not dispute the fact, but made it clear that he did not go so far as to say, and should give the specific gravity of the component parts of the sample.

Mr. Bevan was called to support his certificate, and, questioned at some length by the defendant, said that he was astonished at the readiness with which he was asked to issue the certificate. He was not aware that he was asked, he said, by Inspector Tyler inquiring if a mistake in the description of the compound had not been made somewhere. It not being part of his duty to do so, he did not go into the specific gravity of the sample, but it lacked one essential to real tincture of iodine, and that was iodine. The sample was simply decolourised tincture of iodine. The whole of the foregoing evidence was corroborated by Mr. Robert Watts, of Apothecaries’ Hall, London, past president of the Sheffield Pharmaceutical and Chemical Society, and late lecturer upon pharmacy to the Sheffield School of Pharmacy. He carried the case further by deposing that there was another official preparation known as tincture of iodine; that in question was decolourised tincture of iodine. The former should consist of half an ounce of iodine, half an ounce of potassium iodide, and a pint of rectified spirit. Defendant’s drug was of little value, practically valueless, and was what was known, vulgarly, as an old woman’s remedy.

Questioned by the defendant, he at once admitted that there was an authority known as the British Pharmaceutical Conference, whose opinions were fit for recognition by chemists. In 1889 or 1890 they published a formula for decolourised tincture of iodine. If a man asked him for white iodine he should give them decolourised iodine, the cost of making which was greater. It was asked for occasionally, and generally stocked by chemists.

The defendant, availing himself of the powers under the Act, elected to be sworn. His evidence was that his assistant asked for white iodine, and he supplied this, taking the precaution to put on the bottle a label, “Prepared according to the British Pharmaceutical Conference.” He had a right to sell the drug as it was sanctioned by that conference. It was possible the label could not be seen when the bottle was wrapped up. He did not mark the bottle “white iodine” because he considered the label sufficient indication of its distinction from the ordinary brown iodine.

Mr. J. A. Brown, one of the magistrates, in view of the difference in the medicinal qualities of the two compounds, thought that the use of the word “white” was important, so that the public should not be misled.

The defendant, in reply to Inspector Tyler, admitted that the British Pharmacopoeia was the standard by which drugs should be dispensed, but when told that he suppressed the truth with such authority, did not answer, except to say that the public liked it and asked for it, as it did not discolor the skin so much as the brown tincture.

The Chairman, in giving the decision of the bench, said: “The majority of the magistrates consider there has been no fraudulent intention on the part of the defendant. Technically, he has made a mistake, and we were in doubt if we should not fine him for making the mistake. He was asked for iodine, and gave a different substance, but we—or the majority—do not think he did so with any idea of fraud. The summons is dismissed, but we think the county officers did quite their duty.”

PARAFFIN WAX IN BEEWAX.—On January 9th, at the Bristol police court, before Messrs. Sparke Evans and E. R. Colthurst, George Stevens, shopkeeper, of Old Street, St. Stephen’s Street, was indicted for selling under the Food and Drugs Act for selling one pound of beeswax containing 60 per cent. of paraffin. Inspector Thomson said that on December 10 he called at defendant’s shop and purchased one pound of the best beeswax, paying 2s. 6d. The analysis showed that it contained 60 per cent. of paraffin. Mr. Cross, for the defence, said that Stevens bought the beeswax as pure from a wholesale druggist in Bristol, who purchased it from another druggist. They had good reason to doubt the accuracy of the analyst’s certificate, their own analysis, roughly taken, not showing anything like 60 per cent. It was usual for bee-keepers to put in a little foundation of common wax, which might account for the small amount of paraffin. He asked that a sample might be sent to Somerset House for analysis. The magistrates agreed to this being done.—Bristol Mercury.

LAUDANUM DEFICIENT IN ALCOHOL.—On Jan. 9th, R. Hales, of Old Market St., Bristol, was summoned for selling 8 ounces of laudanum containing only 25-26 per cent. of alcohol. Inspector Thomson bought the laudanum on December 10 and had it tested. An assistant from defendant’s shop suggested that the laudanum had evaporated and that he had been kept in a corked jar. There was only a small sale for it. Finded 20s. and costs.—Bristol Mercury.

Press Comments.

THE NOSTRUM STAMP.—It appears that in 1860 the Government tax on patent concoctions produced £43,600, and that in 1899 this figure had risen to £240,000. We have pointed out that the journals of the various religious sects are the chief offenders, and seem to be particularly favoured by the advertisers of these nostrums. But why should the State, so solicitous of checking fraud and misrepresentation in other quarters, not protect the ignorant from this traffic, instead of actually conniving at it? A poor country like Italy, with embarrassed finances, declines to fill its exchequer by drawing a revenue from fraud. Every proprietary article in that country must have printed clearly on each box or bottle the name and exact amount of each ingredient. The owner may give to his production what fancy name or price he chooses; he is not required to divulge any particular method or art employed in manufacturing his goods, or in rendering them more pleasant to the eye and palate; but he must make no false statements as to the source, nature, use, or the remedy of his medicine. For example, he may advertise his “Pectoral Pick-me-up” as the “souran’st thing on earth” for coughs, colds, bronchitis, pleurisy, etc. But on the label he must state the name and quantity of each ingredient in every dose; and if he suppressed the fact that an ingredient was present, or gave its dosage incorrectly, or claimed that his pick-me-up was a certain cure for consumption, he would at once be prosecuted and convicted of fraud. Having to give the plain, matter-of-fact prescription, he, of course, does not attempt to gull people by advertising his
nostrum as made of "Oriental flowers grown in his own gardens in Arabia." The public buys his goods with open eyes, and not from fraudulent misrepresentation. Can we not take a lesson from Italy?—British Medical Journal.

It is remarkable how proately the medical press is to revert to the mistaken notion that the tax imposed upon secret quack medicines is, on the part of the State, a compensation for fraud and misrepresentation. If the medicine stamp duty were abolished, ignorant and credulous persons would be still more at the mercy of the nostrum advertiser. The practice in Italy is to prohibit altogether the sale of secret medicines, and consequently a medicine stamp duty is unnecessary.—[Ed. Ph. J.]

AMENDMENT OF THE PHARMACY ACT.—A strong movement is on foot among chemists and druggists with the view of securing an amendment of the Pharmacy Act so as to bring limited companies under its provisions. The co-operators having recently decided that, under the law as it stands, such bodies cannot be proceeded against for infringements of the Statute, on the ground that the latter deals only with offences committed by "any person," and not by any association of persons. It is contended that such a state of the law gives an unfair advantage to companies in their competition with individual registered practitioners. In connection with the agitation, a secondary question has arisen as to whether, if a change of the law be pressed for as against the drug companies, it will not be necessary to give up what is known as the "Widows' Clause," which, in the case of a deceased chemist, permits his widow or other executor to carry on the business with the assistance of a qualified manager. This is the only exception to the rule forbidding unregistered persons to sell drugs, and it is much valued; but the trade would perhaps be willing to sacrifice it if by so doing it could get at the limited companies. These bodies, it is alleged, are simply formed to evade the Act, and by thus escaping the penal liabilities of the ordinary practising chemist they are able to undersell and ruin him; and the strong feeling on the subject will find expression in Parliament in the form of a private member's bill.—Liverpool Echo.

Obituary.

Notice has been received of the death of the following:

On January 5, Samuel Hall, chemist and druggist, Eastbourne. (Aged 75.)

On January 9, W. R. Ross, chemist and druggist, Hawick. (Aged 48.) Mr. Ross was enjoying a game of curling on the previous afternoon, when he complained of severe pain. An operation was performed, but the bowel had been ruptured, and Mr. Ross died as stated after a few hours of great agony. He had been in business in Hawick some eighteen years.

On January 10, Mr. James Richard Gardner, pharmaceutical chemist, Plymouth. Mr. Gardner died from Bright's disease, at the Royal Naval Hospital, Stonehouse, where he was dispenser in charge of stores. He had been ailing for some months, but only two days before he had been up.

In charge of stores at Stonehouse Hospital, is Mr. Gardner was transferred to that establishment.

On January 10, Frederick Hewitt, chemist and druggist, Bolton. Mr. Hewitt, who was only twenty-four years of age, was an Associate of the Society. He was married only nine weeks ago, and was at business as usual on the previous Monday, but, feeling unwell, he proceeded home. Accidents sometimes manifest themselves, and he was found to be suffering from typhoid fever, which ended fatally as stated. Mr. Hewitt had been in business some six months, having taken over the business of his late Mr. N. Cunliffe.

Dr. Karl von Hanhauser, Director of the Royal Technical Academy at Munich, Professor of Metallurgy and Mining, member of the Academy of Sciences, of many learned Societies, and of the Supreme Council for Schools, has died at Munich, after a long and severe illness. He was a son of the landscape painter, Max Hanhauser, and was born at Munich on the 28th April, 1839. He studied at Freiburg and Munich, established himself as a private lecturer on mineralogy at the University of Munich, was appointed Professor of Polite and Public Schools, was transformed into the Technical Academy. By his investigations of astromy and Brewer's optical observations on calcit, he struck into a path which has since led to very important results in the physics of crystals. His treatises on the constitution of mineral silicates and his investigation of the decompositions of granite by water belong to the chemical department of mineralogy; in later years he devoted all his attention more to the crystallographic study of numerous organic combinations. He published his results of his studies on the development of new chemical methods, and his introduction of the methods in the instruction of the Munich Academy, and in a treatise entitled "Microscopic Reactions." He was one of the founders of the Austro-German Alpine Club, and edited its periodical organ for several years. After the retirement of H. von Baemfeind in 1889, he was appointed Direct of the Technical Academy.—Standard.

Mr. J. V. Whitaker, a member of the firm of Messrs. Whitaker and Sons, Warwick Lane, London, at "Whitaker's Almanack," has died at his residence in Kensington. The deceased, who was attached to time to the Philadelphia Ledger, had a Transatlantic experience, and during his stay on the American Continent took part in the great Civil War. Returning to England, he became actively engaged in the management of the business of the firm by his father, who survives him, the editorship of the Rockelle being his favourite work. He was in his fiftieth year and it is only within the last few months that his health has failed.—Standard.

Poisoning Cases.

Laudanum.—Elizabeth Hewitt, aged 36, died at Sneinton on Friday, January 4, from the use of laudanum, self-administered. Verdict: "Drunk from misadventure," and added a rider to the effect that bottles containing chlorodyne should be marked poison.—Nottingham Guardian.

Chlorodyne.—Henry Edmund Earthing, aged 25, died on Sunday, Jan. 6, at 8, Crossley Street, Liverpool East. London, from the effects of an overdose of chlorodyne taken as a remedy for a cough. Verdict: "Died from misadventure," and added a rider to the effect that bottles containing chlorodyne should be marked poison.—Islington Gazette.
Notes and Queries.

[The Editor will be glad to receive for publication notes of practical interest to pharmacists, and will also endeavour to furnish suitable replies to any queries that may be sent by readers.]

PIPERAZINE.

[793.] In answer to W.N.G.L., a correspondent suggests the advisability of enclosing the piperazine in cachets, as this has proved satisfactory in his experience, no complaints being received, but repeat orders. The cachets must of course be kept in a dry place.

PHOSPHORUS PILLS.

[794.] Yet another method for dispersing phosphorus in pills is suggested by M. Ledoux, of Liége, who heats anhydrous wool-fat, 4 Gm., and phosphorus 6 G., in a capsule, on a water-bath at a temperature about 45°, until the phosphorus is melted. The mixture is then stirred with a slightly warmed pestle until cool, after which powdered marsh-mallow, q.s. for 120 pills, is added. The finished pills should be rolled in powdered talc and preserved in the same, sheltered from the light (Journ. de Pharm. de Liége, et d'Anvers).

SODIUM SALICYLATE AS A CLEARING AGENT.

[795.] Sodium salicylate dissolved in its own weight of water is recommended by W. Lens as a clearing agent for vegetable sections. It is said to possess an advantage over chloral hydrate, in rapidly converting starch granules into a transparent jelly, which remains clear on adding water, is not affected by the addition of glycerin, and is coloured blue by iodine. The salicylate is also said to alter the cell membranes less than chloral, and its solution mixes well with oil of cloves (Chem. Zeit., and Répertoire).

LATHOL.

[796.] This is the name given to a new antiseptic manufactured by the Clinton Pharmaceutical Company of Syracuse, New York. The preparation is described by the Pharmaceutical Era as a crystalline compound "obtained by the action of nascent iodine upon one of the aniline group." It is said to be odorless, non-irritating, a powerful cicatrisant, well adapted for use as a dusting powder, and insoluble in water, glycerin, fixed oils, and soft paraffin, but can be incorporated with these in all proportions in the preparation of ointments and suppositories.

PURIFICATION OF ETHER.

[797.] M. Eckenberg states that approximately pure ether for analytical purposes can be obtained from commercial ether by adding to the latter 5-10 p.c. of liquid paraffin, that boils above 300° C., and distilling at 40° to 50°. The alcohol and oxidation products are retained in the retort by the paraffin, whilst the water, if much be present, will form a layer beneath the latter. Acids and other objectionable impurities may be removed by this method, which is also applicable for purifying chloroform, acetone, etc. Subsequent heating to 120° expels the impurities from the paraffin and renders it fit for further use (Chem. Zeit.).
Novelties.

[Under this heading it is proposed to publish, from time to time, descriptions of new appliances and apparatus, and other novelties of interest to pharmacists. In submitting such articles for notice, full particulars should be sent accompanied, if possible, by a block of suitable size for the Journal columns.]

“Primus-Dresser” Combination Lantern.

This lantern, made by W. Butcher and Son, Blackheath, London, S.E., has a handsome polished mahogany body, with rosewood doors, and Russian iron lining, done, and top. It is fitted with a 4 inch meniscus and 6½ inch plano compound condenser; massive double-pinion brass rack front; lens mounted in cylindrical form, interchangeable, either 4, 6, 8, or 10 inch focus; incandescent gas jet, limelight jet, or oil lamp; carrier to take ¾ or ½ plate negatives, and an adjustable table for scientific demonstrations. For projection purposes, it forms a perfect single optical lantern, arranged for use with long or short focus lenses, having a bellows extension front, and fitted with a 4 inch meniscus compound condenser, fitted with the incandescent gas light, which gives as well-lighted a picture as the ordinary refugetent oil lamp. Limelight can be used in the lantern if preferred. For scientific demonstrations the bellows closes up to the front, leaving an open space, and for enlarging the lantern is made to take and is supplied with a 5½ inch plano-convex compound condenser, also with carriers to take ¾ or ½ plates. The condenser will cover the whole of a ¾ plate negative and the best part of a ½ plate. The incandescent gas light gives a perfect illumination for enlarging, and is much more convenient than limelight or oil. The lens provided may be used for enlarging, but, if preferred, any ordinary E 17 lens is equally suitable. The “Primus” Cylinder Box, by the same makers, is a strong box for containing compressed gas cylinders, forming a substantial stand when in use, and also a case for transit. It is thoroughly well made in hard wood, with hinges, hasp for padlock, and handle.

A Patent Tooth Brush.

In these days of foreign travel, etc., a tooth brush that folds up and goes into a pocket is a distinct advantage, and such an invention has recently been patented by Mr. H. A. Wanklyn, 17, Manchester Avenue, London, E.C. The tooth brush of which the usual handle is cut off about an inch below the bristles is fixed by means of a screw into the neck of a nickelled metal case, turning on the screw as on a hinge. The brush folds into the case, which is made to fit it exactly, and packs into the compass of 5½ inches. The part of the case made to cover the bristles is perforated for purposes of ventilation, and the neat little article is sold in boxes containing besides two extra brushes, a small instrument for undoing the screw, so that when worn out the old tooth brush can be removed and a new one substituted.

Photographic Novelties.

All former vignetting masks that have been on the market had the great drawback of being only one shape, so that the vignetting could not always be done to suit the print. The “Iris” vignetting mask overcomes all this and adapts itself to any required shape. The frame A is made of wood—upon which are overlapping vulcanite flaps which turn on pivots—and has a black rim, which is laid on the printing frame. The flaps can be arranged to any shape to give any size or form of vignette. Though the flaps can be moved easily, they will not shift by themselves. They are well made and will last a long time, whilst much time is saved by using them, and the best vignettes are obtained. They are made by the well-known firm of R. Lechner (W. Müller), Vienna, who hold the patent, and are supplied in three sizes by C. A. Rudowczyk, 5, Guildhall Chambers, London, E.C., who is also agent for the patent “grain” bromide paper, manufactured by Hoekel and Co., Berlin. This paper is manipulated the same as other bromide papers, but is said to give superior results and to be more easily touched up. The prints produced are described as brilliant, deep, and vigorous, whilst coarse prints resemble good platinotypes.
Photographic Contrivances.
J. A. White says he once chanced to place a common eye-glass lens in front of the diaphragm of a single combination lens, and expected to be surprised at the distortion of the picture. The resulting image was, of course, less in size, but he could discover no other difference in the two images. An interior made with that combination of an achromatic lens and an eye-glass inch focus and an eye-glass lens of seventeen inch focus showed no curved lines, and the title on a sheet of music taken at a distance of fifteen feet showed up clear and distinctly; nor could he distinguish any deflection of the plate. It is best, he states, to have a set of multiple fold lenses, but with the aid of a pasteboard tube (made by rolling up a sheet of paper), his original achromatic lens, a positive spectacle lens of sixteen inches and a negative (for near-sightedness), he has lenses of seven, eleven, fourteen, and twenty inches. Usually the original lens is preferable, but there is many a time when trying to compose a view on a small plate that the seven inch lens, covering a half size plate, comes in handy, or when a distant view loses all detail with the usual lens, the "twenty inch" is very convenient. A front extension is needed for the camera with the "twenty inch," but is easily made of pasteboard. The tube to place the plate is used in the front of the lens with the others behind, and the mounting is easily done. Another contrivance is for taking stereoscopic views with one lens. A front board is fitted with one hole for the lens, the pasteboard tube with an inch hole; this in turn is fitted with a one inch tube to one side of the centre of the board and equidistant from top to bottom. In use the lens is in position to command one of the halves. After exposing that half of the plate the slide is removed, and the front board is reversed in order to expose the other part of the plate. The camera must be clamped rigid that the plate may not be displaced between exposures.—Photographic Times.

Photo-engraving with Silver Nails.
At the last meeting of the Royal Photographic Society, Mr. Leon Warnierkex gave a demonstration for photo-etching, partly dependent on sensitive silver nails instead of bichromated gelatin. A negative of the original is taken in the usual way through a screen. After the negative is developed and dried, it is given a safe edge. The next step in the process is to place the negative in contact with a sheet of paper coated with gelatin pigmented with a sensitive silver salt, such as the bromide, and making an impression, the image being developed with pyro-ammonium. After development, the image is pressed and squeezed in contact with a copper plate previously polished with snakestone and charcoal, the paper backing and the soluble gelatin, together with the bichromated silver, being removed in the usual way. The entire sheet is then washed in the same manner as a carbon image is developed. After washing and treatment with alcohol, the plate, when dried, is ready for etching with perchloride of iron in the ordinary way. The process, Mr. Warnierkex pointed out, might be adapted to photogravure purposes by commencing with a transparency instead of a negative, and transferring the developed negative in the plate grained with asphaltum, the subsequent operations being identical. The process is an outcome of the negative paper process brought out by Mr. Warnierkex in 1888, and described by him in the paper he read before the Society in 1888.—Journal of the Society of Arts.

Developers for Bromide Papers.
Haeckel and Co. recommend the following developer for their "grain" bromide paper (see Supplement, p. 14)

| Solution | I. Potassium oxide, 8 oz.; water, 10 oz. | II. Iron sulphate, 5 oz.; water, 10 oz. | III. Potassium bromide, 1 oz.; water, 10 oz. |

For use mix six parts (7 oz.) of I. with one part of II., add a few drops of III. to obtain extra brilliancy, and then water, 5 oz. After developing, put the prints in a clearing solution (acetic acid, 1 dr.; water, 8 oz.), rinse and fix in hypo, 4 oz.; Alkalis, 90 oz. To hypo, 4 oz., is added 1 oz. of a per cent. solution of rosin, with a few drops of potassium bromide solution as required. After developing, rinse and fix in hypo, solution as above, treating for ten minutes.
Diary of the Week.

**Saturday, January 19.**

**Pharmaceutical Football Club v. Clissold, at East Finchley. Commence at 3 o'clock. Train from King's Cross at 3.15 p.m.**

**Monday, January 21.**

**Society of Arts, at 8 p.m.**

"The Arc Light" (Second Lecture), by Professor Silvanus P. Thompson.

**Victoria Institute, at 4.30 p.m.**

**London Institution, at 5 p.m.**

"Comets" (Illustrated), by Professor Sir Robert S. Ball.

**Imperial Institute.**

House Dinner, at 6.45 p.m.

No. 28,101—Achille Auguste Béchera, 29, Southampton Buildings, Chancery Lane, London.—A new or improved composition or preparation for the destruction of insects. November 25, 1894.

No. 28,111—Valentine Blanchard, Haston, Cambs.—A new or improved method of carbon or pigment printing without transfer. November 25, 1894.
Notes.

NEW POST CARDS.—Post cards of the "Court" or "Correspondence" size, bearing halfpenny impressed stamps, are now on sale at all post-offices. These cards will be sold at the same price as the present stout post-cards.

MEDICAL HONOURS IN AUSTRIA.—Among the twenty-four new life members of the Austrian Upper House gazetted last week, are Professor Albert, surgeon, and Baron Widerhofer, physician.

NEW SCIENTIFIC SERIES.—The first volume of a new scientific series, to be named the Cambridge Natural History, will be issued shortly by Messrs. Macmillan and Co. For this volume articles have been written by the Rev. A. H. Cooke, of King's College, Cambridge; Mr. A. E. Shipley, of Christ's; and Mr. F. R. Reed, of Trinity College.

THE ARTIFICIAL SPECTRUM TOP.—A remarkable and most interesting discovery has recently been made by Mr. C. E. Benham, of Colchester, who noted that a special design printed in black ink on a white card gives, when rotated in a bright light, brilliant bands of colour—red, buff, green, blue, etc. When rotated in the opposite direction the positions of the colours are reversed. This design has been arranged in the form of a small top, which can be obtained of Messrs. Newton and Co., Fleet Street, London.

INDIGENOUS DRUGS OF INDIA.—Orders are now being received by Messrs. Thacker, Spink, and Co., of Calcutta, for a new edition of the work on 'The Indigenous Drugs of India,' by Ral Bahadur Kanny Loll Day, C.I.E., late Professor of Chemistry and Chemical Examiner to the Indian Government. It will contain descriptions of over five hundred of the more important medicinal products indigenous to India, with copious indexes of scientific, English, and vernacular names.

A DIPHTHERIA CHART.—A useful chart, specially arranged for recording clinical facts observed in the serum treatment of diphtheria, is printed by Messrs. Adlard and Son, Bartholomew Close, London. It has been drafted by Dr. Jobson Horne, late House Physician at St. Bartholomew's Hospital, with a view to obtaining careful and complete records of important clinical observations, as well as uniformity in keeping records.

NATURAL HISTORY OF PLANTS.—In the ninth part of Kerferd and Oliver's 'Natural History of Plants,' just issued by Messrs. Blackie and Son, the protection and dispersion of pollen, and the colours and scents of flowers as attractive agencies are dealt with at length in the authors' usual attractive style.

STERILISED MILK IN NEW YORK.—Dr. Nathan Straus shows, in the Forum, that the death-rate of New York has been lowered by the establishment of proper precautions for the sale of milk, success being greatest when sterilised milk has been sold.

CHLOROFORM AS AN ANESTHETIC.—Dr. C. F. Marshall, late anaesthetist to the Hospital for Sick Children, Great Ormond Street, advocates a mixture of chloroform and ether, as being safer in use than chloroform by itself, and at the same time as effectual, and suggests that the use of chloroform by itself should be discontinued.

CHEMICAL SOCIETY GRANTS.—The grants made by the Chemical Society from its research fund during the past year include the following:—£20 to Mr. A. Hutchinson, for experiments on the reduction of benzenoid amides; £50 to Professor Perkin, for continuation of his researches on closed carbon chains; £5 to Messrs. Linder and Picton, for continuation of researches on grades of solution; £5 to Dr. Laycock, for further examination of the products of distillation of bran with lime; £10 to Dr. Matthews, for the continuation of his investigation of benzene hexachlorides and allied compounds; and £10 to Dr. Colman, for the study of e- and 3-amino-fatty acids.

SALTERS' COMPANY RESEARCH FELLOWSHIP.—The Executive Committee of the City and Guilds of London Institute have awarded the first Salters' Company's Research Fellowship, for the encouragement of higher research in chemistry in its relation to manufactures, to Mr. Martin O. Foster, Ph.D., F.C.S.

COCAINE AS AN ANESTHETIC.—Cocaine, according to M. Maurel, of Toulouse, acts on the capillaries, causing contraction, so that thrombosis and embolism may easily be set up. In fatal accidents from the use of cocaine, pulmonary embolism, due to the paralyzed white corpuscles forming plugs in the contracted capillaries of the lung, is the chief cause of death.

APPOINTMENTS AND ELECTION RESULTS.—Messrs. Allwood Simpson and Richard Needham, both chemists and druggists, of Stalybridge, Cheshire, have been appointed Justices of the Peace for that borough. Mr. N. H. Martin, pharmaceutical chemist, was elected a member of the Newcastle-upon-Tyne Board of Guardians last week, and the Newcastle Daily Chronicle remarks that in him science will have a much needed guardian. Mr. R. W. Giles, pharmaceutical chemist, is associated with Mr. R. A. Robinson on the Kensington Vestry. Mr. C. Goddard Clarke, a member of the firm of Messrs. Potter and Clarke, botanic druggist, Raven Row, Bishopsgate, has been appointed Justice of the Peace for the County of London.

ADULTERATION OF FOOD AND DRUGS.—Mr. R. A. Robinson has been elected Chairman of the Special Purposes Committee of the Kensington Vestry. Among other duties, this Committee is charged with the carrying out of the Sale of Food and Drugs Act, and, the Vestry having applied to give evidence before the Select Committee of the House of Commons on the proposed amendment of the Act, it is very probable that Mr. Robinson, as Chairman of the Committee, may be called to give evidence thereon.
COPPER IN PEAR.—An interesting case, under the title of Food and Drugs Act, was heard at Bristol on Friday, January 11, when a grocer was charged with selling a bottle of pickled green peas, containing 0.205 grain of copper, equivalent to 0.32 grain of copper sulphate. It was understood that this was a test case, and after evidence regarding the presence of copper had been given, the case was adjourned until Friday, January 25.

MANCHESTER PHARMACY BALL.—The second annual ball, held on Wednesday night in the Ulme Town Hall, Manchester, was not in any sense behind last year's, and the committee of management is again to be congratulated on having scored a big success. The hall was beautifully decorated, and the company numbered 250. Among the guests were Mr. and Mrs. Michael Cartelghne, London; Mr. R. S. Gibbs, Birmingham; Mr. J. Smith, Liverpool; Professor Young, Owen's College; and a goodly number of local medical friends. Mr. E. S. Johnstone efficiently performed the duties of M.C., and dancing was kept up with vigour till 2 a.m. During the night a short concert was sandwiched in, and songs were admirably rendered by Misses Stanley, Burgess, and Nelly Leeson, and Messrs. Cubbert, Allan, and J. H. Franklin.

Legal and other News.

PRESCRIBING BY A CHEMIST.—At the St. Pancras Coroner's Court, on January 22, Dr. G. Danford Thomas held an inquest on the body of James Jeffries, aged 53, hatter, lately residing at Chester Road, Highgate. The deceased had complained of severe internal pains, and his daughter-in-law went to a chemist's and bought back an 8-oz. bottle labelled "The mixture. One tablespoonful to be taken every hour if needful. J. Johnstone, 213, Kentish Town Road, and Southampton Street, Camden." He had one dose at once, and seemed to be somewhat relieved, but at three o'clock in the morning, when the pains came on again, he had another tablespoonful, and died shortly afterwards. Dr. Johnstone of 239, Kentish Town Road, stated that the mixture contained a small quantity of chlorodyne and sal volatile. He added that he would not have given the medicine if the facts of the case had been correctly described to him. The Coroner: But you know that you have offended against your own Pharmacy Act, and you gave your mixture for administration to a person you knew nothing about?—The Chemist: It is a difficult thing to be a chemist at the present day. All chemists ought to be doctors, it seems to me. You have to say how people are to take their breakfasts, dinners, teas, and suppers, and how to use every halfpennyworth of things. The Coroner: But you know that by prescribing a medicine containing a poisonous and illegal act, for which you can be punished, and it is my duty to tell you so. I know your difficulties, and no doubt you think it hard that when a person comes to you late at night you are not allowed to serve him, but I must tell you that you run a great risk if you prescribe poisons. The Chemist: I do not prescribe for people as a rule, and it is impossible to sell so much chlorodyne—that as I have to mark every single point that was not quite straight or not quite true. He was thus made, by the training of a few months, a far more efficient human being than...
would have been without it. The object of the Sloyd system was really to teach people to do the right thing in the right way. If we could get our education here to do the same thing—to open people's eyes to see and to open the hearts to take in the great thoughts that the world could produce for them—we would do a great deal to train them to be capable men, fit to be the citizens of the world, the interests of which were the largest the world had ever seen, and the responsibilities of which were so enormous that no man could think of them without a certain fear in his heart.

Reference was made to this address by a pharmaceutical candidate for School Board honours at Newcastle, at an election meeting on the following night, when Mr. N. H. Martin observed that Dean Kitchin said that the Sloyd system made a man a more efficient human being than he would be without it, but asked where was the evidence that the Swedes was a far more efficient human being than the Britons? How long had the Sloyd system been in existence in Sweden? If it was of recent growth, let Sweden go on with the experiment, and they would watch it. If it had been in operation 20, or 50, or 100 years, why was Sweden not the greatest power to-day, because it was all very pretty for a Dean on his holiday very idyllic. Toys made by the Swedes in the winter were hawked in the streets of Newcastle. If that was to be the result of our education, he for one would go to another country for his education. The Dean praised Sweden for disregarding pounds, shillings, and pence. He had always understood that Sweden was a poor country. Was their poverty the result of this disregard?

SALE OF INDICENT PHOTOGRAPHS.—At the County of London Sessions, on January 22, before Sir P. H. Eden, Q.C. (chairman), Howard Hagen, 95, charged as a chemist, pleaded guilty to having unlawfully sold to one McGowan certain improper photographs at No. 5, Railway Approach, Charing Cross. Mr. Elliott prosecuted, and the prisoner was represented by Mr. H. L. Lawless. Mr. Lawless said that the shop at Railway Approach was sold to a Mr. Mitchell about a year ago. Hagen was in the service of the previous proprietor prior to being employed by Mr. Mitchell. The prisoner had borne an excellent character, and sold the articles without the slightest knowledge on the part of Mr. Mitchell. Sir P. H. Eden sentenced Hagen to twenty-one months' imprisonment with hard labour. The clerk was ordered to be discharged. The proprietor of the chemist's shop, Mr. Mitchell, was exonerated from all blame by the Court. —Daily News.

PHARMACEUTICAL FOOTBALL CLUB.—A match was played between the Pharmaceutical and Clissold Football Clubs, on the ground of the latter at East Finchley, on Saturday. It had been looked forward to with great interest, as Clissold is one of the strongest clubs the Pharmacists meet this season. The list of players arranged to meet their team was moreover encouraging. G. W. Allen was fortunately able to play, and took up his usual place as centre half-back, a place which suits him no less as player than as manager. Great Britain, among the forwards, were very strong. Robson and F. Sturtum, the latter coming out or the first time this season, but Wand was conspicuous by his absence. Now that he has left London he will be much missed, especially as last year, the only one who could equally fill his place as goal, is under orders not to play. Clissold won the toss and elected to play down the slope, which soon showed its effect on the visiting team. After about five minutes, Clissold from a throw-in sent the ball between the posts, but the throw-in was ruled a foul, and no goal was allowed. Soon the Pharmacists pressed and a shot from W. Allen was saved, the man who put off the goal as he stood behind or on the line. At half-time Clissold led by one goal to nil. On resuming play the Pharmaceutical men had much the best of the game, pressing their opponents repeatedly, but as they were playing short of a man, and had no centre-forward, their efforts were not so successful. A goal was obtained, however, by Sturtum, who was in the act of adding a second when the whistle blew for time, a moment too soon, the game thus ending in a draw.

DEATH FROM ANTHRAX.—A coroner's jury at St. Helen's, on January 21, found that Isaac Biddulph, an assistant to a baker's factory, and who had been infected by the microbes of which were absorbed into his system from the bones of cattle used in the preparation of manure. It was stated that there had been other similar cases in the works, and the Government inspector undertook to report the matter to the Home Office with a view to making special rules for the regulation of manure factories. —Standard.

GAS AND ACETYLENE.—Professor Vivian B. Lowes of the Royal Naval College, Greenwich, read a paper at the Society of Arts, on January 16, on the possibility of making high value illuminating gas without the use of coal, oil, or other organic material. Of late years, he said, an idea had been slowly permeating the minds of some gas managers in this country that it might be well to adopt a dual gas supply, one for fuel purposes, which would consist of a poor coal gas of about twelve candles, whilst the gas for illuminating purposes would be of about twenty candles; and in one town, at least, it had been proposed, and, he believed, carried out, that a supply of poor quality coal gas should be sent out during the day, when the maximum consumption of heating purposes, and that night for illuminating purposes, utilizing the same mains for both. Although this was possible in a small town, where the area to be supplied was not large, it would be impossible in a big town where many miles of huge mains had to be travelled before certain districts are reached, and the cost of a double set of mains would render a dual supply an impossibility. The use of acetylene, which he described as a clear, colourless gas, would, he said, render it possible for the gas company to send out a 12-candle gas for heating purposes, both by night and day, whilst a small enrichment cylinder might be attached to the gas outlet pipes from the consumer's meter, and which would be made to automatically enrich the gas supplied to his house, so that by setting a valve he could have any quality he might desire. The economic value of an illuminant such as acetylene became apparent, when they compared the cost of the gas for equal illumination with the light obtained from other illuminants. The London gas had an illuminating power of 16 candles, while the acetylene had an illuminating value of 240 candles, and this, at 8d. 9½d. per 1000, would in light-giving value be equivalent to London coal gas at 4s. 4d. per 1000. In order to obtain a given illumination, moreover, the volume of gas to be consumed was excessively small, as compared with any other illuminating gas, and the products of combustion were reduced to an excessively low limit. One hundred cubic feet of London coal gas would yield 60 cubic feet of carbon.
dioxide, and 140 cubic feet of water vapour, as the products of its complete combustion, whilst 100 cubic feet of carbon dioxide and 100 feet of water vapour produced was enormously smaller. The intensity of the light was made by small wax lamps of enormous value for lantern projection, for railway signals and bicycle lamps, whilst the ease of production specially adapted it for such purposes as lighthouse illumination.—Standard.

SALE OF FOOD AND DRUGS ACT.—At the annual meeting of the Society of Public Analysts, held on January 16, at Burlington House, the valedictory address of the retiring President, Sir Charles A. Cameron, M.D., expressed the hope that the labours of the Select Parliamentary Committee which sat last year, and was about to be re-appointed, would result in recommendations leading to more stringent enactments for the regulation of the sale of articles of food and drink. A great deal of the evidence laid before the Committee during the last session had emanated from witnesses more or less closely connected with the retail trade in that branch of the Sale of Food and Drugs Act dealt with, and it was therefore not surprising that the evidence so far had not been wholly in favour of increased stringency in the suppression of adulteration. He hoped, however, that the evidence which the public analysts—who had yet to be heard—would lay before the Committee would convince them that to relax the provisions of the present rather weak Acts would not be to the advantage of the public at large. The Council of the Society of Public Analysts had drawn up its recommendations in the form of a draft Bill, which had been the outcome of long and careful deliberation and consideration, and he trusted that the outcome of the Parliamentary Committee's deliberations would be the adoption of a Bill substantially similar to that submitted to them by the Society. Some legal provision for the laying down of authoritative standards was, in his opinion, highly important. Legal standards were at present not completely satisfactory, a fact often taken advantage of by counsel and solicitors engaged in defending cases of undisputed sophistication. The working of any fresh Act would be very greatly facilitated by the provision of officially recognised data as to the proper composition of the various articles of food. The question of water in butter was referred to at some length, the President expressing his unsatisfied conviction that no properly made butter need contain more than 16 per cent. of water. The percentage of water in Irish butter, which until recently was very often high, had steadily declined in the face of the persistent conduct of the authorities in prosecuting the vendors of samples containing an excessive quantity. Within the last two years nearly 200 convictions had taken place in Ireland on his certificates alone, the greater proportion of these cases having occurred in the province of Munster. It was perfectly easy to make butter so that it should contain at the outside not more than 16 per cent. of water, and carelessness or want of skill on the part of the maker should not be allowed to inflict wrong on the consumer.—The address on account of the detention of the President in Dublin, where the continued prevalence of small-pox kept him at his duties as medical officer to the court of Mr. Bernard Darwin, secretary to the Society.—Dr. T. Stevenson, F.R.C.P., the official analyst to the Home Office, was elected president of the Society for the ensuing year.—Daily News.

THE MATTHEI REMEDIES.—At the Workshops County Court, on Tuesday, January 15, before His Honour Judge Matthew, a case was brought forward in the name of Nelly Pinder, named a lady named Blakely, who lives at "The Man Depot," Newcastle Avenue, Workshops, sued a name of Workshops and district residents for some of whom which she alleged were due to her for medicines supplied. At the hearing of the case it appeared that in plate of the defendant had dispensed the Matthei remedies. A young named Nelly Pinder, who appeared for the plaintiff, said the prescriptions were made up by herself, as they did not, according to her belief, cure poison. His Honour then adjourned the case in order to have the medicine analysed, and on the comment on the fact that unlicensed persons were allowed to dispense things of this sort, in that if allowed by law it was a source of danger to the public at large. At the hearing of the cases, the people who were sued for alleged the whole thing was a fraud. The plaintiff was now represented by Mr. A. Charles of Retford, who stated that the whole of the cases entered into at the previous court were withdrawn, and one of the defendants from Cocks-in-Lindwick asked for costs, and this Mr. Charles Charles of Retford, who stated that the whole of the cases entered into at the previous court were withdrawn, and one of the defendants from Cocks-in-Lindwick asked for costs, and this Mr. Charles Charles of Retford, who stated that the whole of the cases entered into at the previous court were withdrawn, and one of the defendants from Cocks-in-Lindwick asked for costs, and this Mr. Charles Charles of Retford, who stated that the whole of the cases entered into at the previous court were withdrawn, and one of the defendants from Cocks-in-Lindwick asked for costs, and this

ACTION AGAINST A MEDICAL PRACTITIONER.—In the Sheriff Court of Renfrew and Bannockburn, on Thursday, January 24, Sheriff Fyfe and Murray, writers; agent for the defendant, John Cameron, solicitor. Mr. P. M. McDonald, E.S., Edinburgh, watched the case on behalf of the Pharmaceutical Society of Great Britain. The plaintiff claimed £500 damages and expenses for alleged libel. From the averments of the plaintiff it appeared that the libel consisted of statements made by the defendant that the plaintiff did not pass the preliminary examination of the Pharmaceutical Society of Great Britain, but had, as a matter of fact, applied with a Francis Lambie, of Greenock, who had passed the examination in his stead. The plea of the pursuer was:—

The pleas of the pursuer were:—

1. The defendant having maliciously defamed the
Poisoning Cases and Inquests.

Belladonna.—William Howat, aged 53, died at Urnston on Monday, January 14, from the effects of belladonna poisoning. Verdict: "Death by misadventure."—Manchester Courier.

Spirit of Salt.—Louis Thomas, aged about 30, died in the Infirmary at Homerston on Thursday, January 17, from the effects of spirit of salt, self-administered. —Star.

Prussic Acid.—Albert Wallace Belfitt, aged 31, died on Friday, January 18, at Newbold Moor, near Chesterfield, from the effects of prussic acid, self-administered. —Sheffield Independent.

Narcotic Poisoning.—James Hamilton, aged 53, died on Saturday, January 5, at Wade's Temperance Hotel, South Road, Bishop Auckland, from the effects of a narcotic poison. Verdict: "Deceased died from an overdose of some kind of narcotic poison."—Middleboro Weekly Gazette.

strychnine.—Henry Clinton Davies, aged 38, died on Friday, January 18, at the Red House, Mare Street, Hackney, from the effects of strychnine, having taken by mistake four doses of medicine containing that poison. Verdict: "Accidental death."—Standard.

Vermin Powder.—Margaret Harriet Woods, aged 28, died on Monday, January 21, at Lancaster, from the effects of a vermin powder, self-administered. Verdict: "Suicide during temporary insanity."—Manchester Courier.

Morphine.—James John Shean, aged 19 months, died on Thursday, January 10, at Aberillery, from the effects of medicine containing morphine, accidentally given to the child by its mother, who was under the impression it was cold tea. Verdict: "Accidental death."—South Wales Daily News.

Press Comments.

THE COMMUNICATION OF DISEASE BY OYSTERS.—We understand that the President of the Local Government Board has instituted an inquiry into the circumstances under which the cultivation and storage of oysters and other shellfish around our coasts are carried out. He has taken this step in view of information brought under his notice in a report which was recently submitted to him by Dr. Thorne Thorne, chief medical officer of the Board, on the subject of "Cholera in England during 1883," which report is now passing through the press and will be shortly issued. The medical inspector primarily charged with the inquiry is in communication with departments of Government concerned with the coastline and river estuaries, and with other authorities. The subject of the possible communication of disease as the result of the consumption of oysters in a diseased state is now in a new one. It has often been suggested as the means by which typhoid fever has been conveyed, and instances have at times been cited in confirmation of this view. But until quite recently the matter has been found difficult of proof, because it is by no means easy to set aside all other causes of this disease, and because the number of oysters containing the infection of typhoid fever are by no means great. On the other hand, it is known that oysters and other shellfish are often

Food and Drugs Act Prosecution.

At South Shields on January 18, before Alderman Eltringham, Alderman Imrie, and Dr. Orlap, Mason and Co., Limited, chemists, were summoned for having sold three ounces of precipitated sulphur not of the nature and substance demanded. The town clerk (Mr. J. M. Hayton) was for the prosecution and Mr. C. W. Newlands defended. Michael Pollock, inspector under the Food and Drugs Act, stated that on December 17 he sent his assistant into the defendants' shop in Green Street for three ounces of precipitated sulphur, which was contained in a packet. He took it back to the shop, divided it into three parts, one of which he sent to the public analyst, who had since certified that it contained 63 per cent. of hydrated sulphate of lime. By Mr. Newlands: The label on the packet was marked "milk of sulphur." Dr. Turnbull, medical officer, said that precipitated sulphur should be pure sulphur and free from the foreign ingredients, therefore free from sulphate of lime. Mr. Newlands contended on a technicality that the proceedings should have been against the actual seller of the article, not the company. He also asked the Court to say that the article supplied was milk of sulphur and not precipitated sulphur as the label on the packet indicated. The inspector knew better. That being so, there was no evidence that it was not milk of sulphur that was sold, and the case, therefore, must fail. If necessary, he asked for an adjournment to prove that what was sold was pure "milk of sulphur" as the label on the packet indicated. The magistrates retired to consider their decision, and found the case proved. A fine of 20s. and costs was imposed. —Shields Daily Gazette.

character of the pursuer to his loss and injury, the pursuer was entitled to reparation.

The statements complained of having been uttered by the defendent, and intended and understood to bear the actionable meaning put upon them by the pursuer, the latter was entitled to reparation from the defendent.

3. The statements complained of by the pursuer being false and calumnious, he was entitled to solutum and damages.

The plea for defendent was:—

1. The action was irrelevant.

2. The defendent, not having slandered the pursuer, was entitled to absolvitor.

3. Veritas.

4. The damages claimed were excessive.

5. The defendent should be found entitled to expenses.

The case was not finished at the time of going to press, but a complete report will be published next week.

"AN UNLIMITED SHAM."—At Shoreditch County Court on Tuesday, before Judge French, William Jeans, manager of the London and Great Western Drug Company (Limited), was treated, by acquittal, by his clergymen and chemists, for goods supplied. Mr. Moore, who appeared for defendent, admitted that the money was owing, but said that the limited company was the debtor and not defendent. In answer to his Honour, stated that the business was formerly his own. He sold it to the company some months ago. Judge French: "Many of the clergymen are there? Defendent: Nine. Judge French: What is the capital? Defendent: £650. Judge French: Did the company pay you any money for the business? Defendent: No, I was paid 500 fully paid-up shares. Judge French: This is one of the greatest shams I have ever come across. The limited company is an unlimited sham. I find it a matter of fact, that the defendent is the company. Every small tradesman in the country could find an easy exit from bankruptcy if this sort of thing were allowed. Judgment for the plaintiffs, with costs.—Times.
cultivated and stored in proximity to sewer outlets; and even where the dilution of the sewage with seawater is great, the entanglement of particles of sewage in the beard and other parts of the oyster must inevitably detract from the palatability of the shellfish. It now appears that Dr. Thorne Thorne, in studying the question of cholera in England during the year 1895, has felt it his duty to lay before the President of the Local Government Board certain views as to some relation between oysters and other shellfish on the one hand and the transmission of cholera on the other. His report, of course, is not for some few weeks, but enough is known to show that it has become a matter of public importance to know precisely what are the conditions of risk or of danger that exist. — Times.

THE SALE OF POISONS.—Despite the law, poisons can be obtained with incredible facility. Strychynine pills are now sold by some chemists in fairly large quantities—at any rate, in quantities sufficient to kill many persons—although they are liable to a penalty for so doing; and consignments are sent over from the United States and Canada to private individuals, enclosed in letters and book packets. Carboëric acid, again, is a most deadly poison, but no restrictions whatever as to its sale are imposed. And what are the results? Simply this:—That dozens of deaths are recorded each year from accidental carbolic acid drinking.—Echo.

THE BELGIAN POISONING MYSTERY.—The great poison mystery now being unravelled at Antwerp draws attention to the fact that capital punishment is now practically a dead-letter in Belgium, owing to the persistent refusal of the King to sign a death-warrant under any circumstances. The erstwhile "cock-pit of Europe," however, manages to provide the world about every ten years with a causa célèbre of the first magnitude. The last criminal who perished on the scaffold in Belgium was the Count Visart de Pencarmó, a learned amateur chemist, tried at Mons in 1854 for poisoning his brother-in-law by nicotine. The case occasioned the greatest excitement, and many well-known French and English littérateurs were among those who spent a whole month in Brabant. Next came the Rish Allah murder at Brussels in 1867, which eventually cost the Daily Telegraph several thousand pounds. More sensational than either was the Feltzer assassination case of 1881. The interest felt in its details were world-wide, and one of the convicts (both the prisoners were formally condemned to death) still survives in prison at Louvain. It is doubtful if either of these three trials could compare in importance with the Joniaux trial now proceeding. The accused is not only the wife of a high Government official, but is the daughter of General Ablay, a favourite aide-de-camp of Leopold I., and the sister of another distinguished soldier.—News of the World.

CORONER AND CHEMIST. —"It is a difficult thing to be a chemist," said Mr. Johnstone, of Kentish Town Road, when reminded by the coroner that he ought not to have prescribed a mixture containing poison. Seeing that the patient died from the effects of the medicine, it was matter of little whether he partook of Mr. Johnstone's chlorodyne and sal volatile or not. Still, it is illegal for a chemist to prescribe—though he may, as Mr. Johnstone pointed out, sell a pint of poison if he puts a stamp on it and sells it as a proprietary medicine. In spite of the obvious propriety of the law in that effect, the coroner agrees with Mr. Johnstone that the lines of the modern druggist do not fall in pleasant places. What between the general practitioner who dispenses his own medi-cines and the stores which undersell him the druggist has hard work to get any profit out of his drugs. Wherefore he is excusably apt to assume a portentously professional expression of countenance when queried as to the advice given to a customer who wants "something to pull me together" or "put me to rights," to accept the customer's account of his symptoms, and to dose him according to his light. Ninety-nine times out of a hundred his treatment serves its purpose; but, of course, it does not allow for aortic aneurism. —Daily Graphic.

PHOSPHORESCENCE AT LOW TEMPERATURE.—Before a large audience in the Royal Institution last night Professor Dewar described his continued investigations of the properties of matter at extremely low temperatures, and the experiments he made exhibited the phosphorescence which certain substances attained when, having been frozen to a temperature of —186°, they were exposed to a beam of light. Chemically, the lecture promised to classify bodies under a new system, the index to be the amount of phosphorescence which bodies were capable of emitting and of sus- taining a specific temperature. There were highly phosphorescent bodies, made of phosphorescent water, and the white of egg is much more phosphorescent than the yolk, and pure water than Thames water. The idea suggests itself that the luminosity of some of the heavenly bodies may be due to phosphorescence at extremely low temperatures. However, phosphorescence may be, the probability of finding some new light being thrown on the constitution of matter by the researches now being carried on in the former workshop of Faraday, and all interested in the progress of physical and chemical science will await further developments with interest. — Pall Mall Gazette. January 19, 1895.

* * * The latter portion of the foregoing paragraph is of interest inasmuch as it appears to be taken bodily from the conclusion of the report of Professor Dewar's lecture before the Chemical Society, which appeared in the Pharmaceutical Journal for July 7, 1894. [Ed. Phra. Journ.]

TEMPERANCE BEVERAGES.—Mr. A. W. Stokes, the public analyst for the parish of St. Matthew, Bethnal Green, mentions in his report to the Vestry that during the last quarter there had been submitted to the authorities for approval several new beverages consisting of hop ale, non-alcoholic stout, lemonade, ginger beer, ginger stout, and ginger wine. Except the last, all of these were genuine, containing mere traces of alcohol, ranging from two-tenths to nine-tenths of one per cent. of proof spirits. But the sample of ginger wine, bought at a shop at which temperance beverages only were supposed to be sold, contained 10 per cent. of proof spirits. This is about twice the alcoholic strength of ordinary beer supplied at public-houses. The Sanitary Committee considered this a case for the Excise rather than for prosecution under the Food and Drugs Adulteration Act, hence no proceedings were taken.—Standard.

ADULTERATION AT BETHNAL GREEN.—Teetotallers in the parish of St. Matthew, Bethnal Green, will be grieved to hear that some of the ginger beer supplied to them as a temperance beverage contained 10 per cent. of proof spirits. This is about twice the alcoholic strength of ordinary beer provided in public-houses. Mr. Stokes, the analyst, reports that 12 per cent. of the temperance beverages sold in the parish are adulterated. The same gentleman makes a curious statement respecting baking powders. The one pound box holds a certain weight of powder, and the higher law courts that baking powder is neither a drug nor a food, so that until it forms part of some bread the vendor cannot be prosecuted for using alum as one
New Drug Companies Registered.

JAMES WOOLLEY, SONS AND CO., LTD.—Registered January 7, by George Treanor, 7, New Court, Carey Street, W.C., with a capital of £160,000, in 210 shares. Object:—To acquire and take over as a going concern the business of pharmaceutical chemists and wholesale and retail druggists, by George Treanor, Hermann Woolley, Charles A. Johnstone, and Edward J. Woolley, at 13, Victoria Bridge Street, Salford, and at Knowsley Street, Chestham, and Nos. 67 and 69, Market Street, Manchester, under the styles of "James Woolley, Sons and Co." and "James Woolley," and to carry on the business of chemists, druggists, drysalters, oil and colourmen, importers, exporters, and manufacturers of and dealers in pharmaceutical, medicinal, industrial, and other preparations. Signatories:—

George S. Woolley, 13, Victoria Bridge Street, Salford; Hermann Woolley, 13, Victoria Bridge Street, Salford; O. A. Johnstone, 13, Victoria Bridge Street, Salford; E. J. Woolley, 13, Victoria Bridge Street, Salford; Alfred E. Blair, 69, Market Street, Manchester; John H. Franklin, Knowsley Street, Chestham.

There shall not be less than two nor more than five directors. The first are George S. Woolley, Hermann Woolley, Charles A. Johnstone, and Edward J. Woolley. Qualification, £21,000. Remuneration as may be fixed by agreement or by the company in general meeting. Registered office, 13, Victoria Bridge Street, Salford, Manchester. Financial Times.

WILLIAM HAY, LIMITED.—Registered by Jordan and Sons, 130, Chancery Lane, W.C., with a capital of £30,000 in 210 shares. Object:—To acquire and take over as a going concern the business of a wholesale and retail chemist, retailer and mineral water, and soluable essence manufacturer, now carried on by William Hay at the borough of Kingston-upon-Hull under the style or firm of William Hay; with a view to such acquisition, to enter into and carry into effect an agreement which has already been prepared, and is expressed to be made between the said William Hay of the one part and the company of the other part, and to carry on the business of wholesale and retail chemists, wholesale and export druggists, manufacturers of and dealers in all kinds of serated and mineral waters (natural and artificial), 12 Victoria Drigge Street, Salford; and an importers of essences, perfumers, squives, and cordials, manufacturers of and dealers in all kinds of soluble and other essences, etc. The first signatories are—Shares.

W. Hay, manufacturing chemist, Holton House, Beverley Road, Hull; Mrs. Agnes E. Hay, Holton House, Beverley Road, Hull; A. Baggertn, banker, South Ella, Hull; W. J. Jackson, director of chemical works, Anlaby Road, Hull; J. Pearson, commercial traveller, 73, Hamilton Road, Reading; W. F. Burtkashaw, chartered accountant, 2, Parliament Street, Hull; T. Hodge, Jun., Bank Chemist, Hull; and B. L. Herrick, Hull Banker.

There shall not be less than three nor more than five directors. The first are William Hay (chairman), William J. Jackson, and Joseph Pearson. Qualification, £20,000. Remuneration as fixed by the company in general meeting. Registered office: 4, Regent's Terrace, Anlaby Road, Hull.—Financial News.

Publications received.

Notes and Queries.

METHYLATED SPIRIT IN TINCTURES.

[798.] A. Ashby detects the presence of methylated spirit in tinctures, spirits, and other compounds, by mixing equal parts of a 1 p.c. solution of sodium nitroprusside and the suspected sample or its distillate, then adding a few drops of ammonium, and observing the colour of the mixture after standing for ten or fifteen minutes. If acetone or some other constituent of wood spirit be present in appreciable quantity, a fine red colour will be developed. The test is said to reveal the presence of 1 p.c. of acetone in rectified spirit, or, in the first 5 C.c. of a distillate from 25 C.c. of spirit, whilst in three successive 5 C.c. quantities of distillate tested and compared with each other, even 0.25 p.c. may be detected. Aconite, belladonna, soap, and compound cambphor liniments, made with methylated spirit, all yielded the reaction. (Analyst).

SALUBRIN.

[799.] Under this fancy name a patent has been taken out for a medicament containing acetic acid, 3 parts; soetio ether, 35; alcohol, 60; and water, 25. Diluted with water (2-3 parts to 1 part of salubrine) it is recommended for antiseptic and hemostatic purposes, for bruises, skin affections, rheumatism, etc. (Med. Moderna and Répertoire).

MICROSCOPE LAMP.

[800.] W. S. Baxter.—The Koch's Wols lamp, in which the light is refracted along a bent glass rod direct to the object, came from Germany. It was not considered a success by English workers with the microscope, although it is useful for low power work. C. Baker, 244, High Holborn, W.C., can supply it.

CREMMY ACID AND SERUM.

[801.] Charles Barnett.—You will find all the information you require concerning orsayle acid in 'Watte's Dictionary of Chemistry.' The preparation of serum from blood is described in the Journal for October 13 last. A. and M. Zimmermann, Cross Lane, St. Mary-at-Hill, E.C., can supply Arnson's antitoxin serum.

Application for Patents.

Compiled from the Illustrated Official Journal (Patents.)

Where complete Specification accompanies Application, an asterisk is suffixed.

No. 28,185.—Charles Thomas Gardner, St. James' Street, Brighton.—An improved sterilising, disinfecting, and deodorising fluid. *—November 20, 1894.

No. 28,344.—Charles Stothart Pearson and Ernest Lodge, Newsome, 6, Bank Street, Manchester.—Improvements in the distillation of water, and in apparatus therefor. November 20, 1894.

No. 28,360.—Frederick Sigismund Salberg, 383, High Holborn, London.—Improvements in, or relating to, apparatus for applying disinfectant to w.o.'s, dustbins and other places. November 20, 1894.

No. 28,360.—William Henderson Walker, 6, Lord Street, Liverpool.—Improvements in, or relating to, the treatment or manufacture of extracts of malted grain or the like. December 1, 1894.
Diary of the Week.

[Notices for insertion under this heading should reach the Editor on or before Wednesday.]

SATURDAY, JANUARY 26.
Pharmacetical Football Club v. Stormont, at Wormholt Farm, Shepherd's Bush, commencing at 3.15 p.m.

MONDAY, JANUARY 28.
Royal Geographical Society, at 3.30 p.m.
"Journeys in South-West Siam," by H. Warington Smyth.
Imperial Institute.
House Dinner, at 6.45 p.m.
"Egypt and the Nile," (Illustrated), by Lieut.-Col. C. M. Watson, at 3.30 p.m.
London Institution, at 5 p.m.
"Native Life in India," (Illustrated), by R. W. Fraser.
Society of Arts, at 8 p.m.
"The Arc Light," (Third Lecture), by Professor Silvanus P. Thompson.

TUESDAY, JANUARY 29.
Royal Institution of Great Britain, at 5 p.m.
"The Internal Framework of Plants and Animals," (Third Lecture), by Professor C. Stewart.
Central London Throat, Nose, and Ear Hospital, at 5.30 p.m.
"The Antitoxin Treatment," (Fourth Lecture on Diphtheria, Illustrated), by Lennox Browne.
Royal Colonial Institute, at 8 p.m.
"South Africa," by Dr. F. Rutherford Harris.

WEDNESDAY, JANUARY 30.
Imperial Institute.
Concert Dinner, at 6.30 p.m.
Ladies' Concert, at 8.30 p.m.
Society of Arts, at 8 p.m.
"Feeding the Thomas Child.
University College (London) Chemical and Physical Society, at 5 p.m.
Ordinary Meeting.
Edinburgh Chemists, Assistants', and Apprentices' Association, at 9.15 p.m.
Debate.

THURSDAY, JANUARY 31.
Royal Society, at 4.30 p.m.
"Argon," by Lord Rayleigh and Professor Ramsey.
Imperial Institute, at 4.30 p.m.
"India and Its Women," by S. E. J. Clarke.
Royal Institution of Great Britain, at 5 p.m.
"Four English Humourists of the Nineteenth Century," (Third Lecture), by W. S. Lilly.
London Institution, at 7 p.m.
"Frans Schubert," (Illustrated), by Professor Ernst Panzer.
Society of Arts (Indian Section), at 5.30 p.m.
Chemists' Assistants' Association, at 8.30 p.m.
Short Papers by Members.
Physicists, Devonport, Stonehouse and District Chemists' Association, at 8.30 p.m.
"Pharmacy Real and Ideal," by Mr. Hodge.
School of Pharmacy Students' Association, at 7 p.m.

FRIDAY, FEBRUARY 1.
Geologists' Association, at 8 p.m.
Annual General Meeting.
Royal Institution of Great Britain, at 8 p.m.
Queeket Microscopical Club, at 7 p.m.
Exhibition of Objects.

SATURDAY, FEBRUARY 2.
Royal Institution of Great Britain, at 5 p.m.
"Stained Glass Windows and Painted Glass," (Third Lecture), by Lewis F. Day.

Exchange.

[Notices of books, apparatus, etc., for exchange, or inserted free but must not exceed thirty words, including name and address, and will not be admitted if of the nature of an ordinary advertisement.]

WANTED.
DRUG MILL, capable of dealing with 14 to 28 lbs. of material.—White, Dispensary, St. Thomas's Hospital, S.W.
CUBRE, Lancaster's or other half-plate, long-erosion, to take Lancaster's dark slides.—Greenwich, 28, Seel Street, Dorset Square, W.
"PHARMACEUTICAL JOURNAL."—April 15, 1888, and May 6, 1888. Full price will be paid for clean copies by the Secretary, 17, Bloomsbury Square, London, W.C.
DRID PLANTS.—Cephalis ipecacuanha (South America), with flowers and roots; Pilocarpus species (South America), with flowers and fruits; Strophostyles species (East Africa), with flowers and fruits.—Holmes, 17, Bloomsbury Square, W.C.

OFFERED.
HERBARIUM SPECIMENS of Ferula narther, and East Indian and British medicinal plants.—Holmes, 17, Bloomsbury Square, W.C.
RAPHAEL'S OPIOMETER, never used, cost 45s.; what cash offers? Also 1 dozen spectacles, cost 30s.; 2 dozen at 30s.; 6 dozen at 24s.; 4 dozen at 18s.—Budd, Westgate, Ripon.
RECIPES, 130 well-tried, general, remedial, veterinary, toilet, and every-day preparations, neatly copied in book. Post-free, 1s. 6d., or exchange patents or books.—Tally, chemist, Haslington.
FORTY-GALLON STEAM JACKETED PAN for sale, £11 nett. Jacket and pan all copper, tinned inside, and good as new.—Hosie, chemist, Ilkeston.
TOMLIN'S RECEIPTS, 1s. 3d., new; "How do I stand?" a complete bookkeeper, 5d., new; Muspratt's "Chemistry," 1860 edition, in good condition, 20s., complete.—Wills 41, Dorset Street, Bolton.
"CHEMIST AND DRUGGIST," 1882 to 1894 inclusive; 1s. 6d. per year or exchange.—Moody, 64, Cold Harbour Lane, S.E.

Trade Marks Applied For.

[Compiled from the Trade Marks Journal.]

188,019.—LAPINE. A chemical preparation in the nature of a varnish.—Robert Ingham, Clark and Co., West Ham Abbey, Essex. November 27, 1894.
188,170.—THIOFORM. Medicines for human use.—Speyers and Guppy, 15 and 30, Knaresborough St., Frankfort-on-the-Maine, Germany. October 25, 1894. The essential particulars are the combination of devices and fac-simile signature of the applicant.
188,564.—FRAYTAYNE. A medicine for human use, for whooping cough, bronchitis, coughs, colds and other affection of the chest.—James Roberts, 58, Haddenfield Road, Eland. November 2, 1894. The essential particulars is the fac-simile of the applicant's signature.
188,283.—DEVICER CLAY HOLDING OVAL OBJECT, Good-cure.—Benjamin Hosegood, 6 and 7, Artillery Street, London. November 22, 1894.
184,065.—DEVICER OF A FROG. Medicated confection for human use.—Hance Brothers and White, Marble Street, Philadelphia, Penn., U.S.A. December 1, 1894.
9,098.—NURIUM. All goods in Class 14.—Reynolds.
18Branson, 18, Briggate, Leeds, Yorkshire. November 27, 1894.

Unclassified Advertisement.

ENGAGEMENT wanted as IMPROVER. Tall. Time for study. In or near London. E. A. Es., 5, Searle St., W.C
Notes.

HUNTERIAN RELICS.—Portraits of John and William Hunter, John Hunter’s clock, and two volumes of valuable autographs have been presented to the Royal College of Surgeons by Mr. William Hunter Baillie.

PROFESSOR PRINGSHOEII'S LIBRARY.—We learn from the *The Athenæum* that the heirs of Prof. Pringsheim, who was President of the Deutsche Botanische Gesellschaft from its foundation in 1883 have made over to that society his extensive library, together with the sum of 25,000 marks for its maintenance. In accordance with the statutes of the Botanical Society no library was to be maintained in connection with it, but the munificent gift was nevertheless gratefully accepted.

SALE OF FOOD AND DRUGS ACT.—At the annual meeting of the London Chamber of Commerce, the following resolution was agreed to:—“That in the opinion of the Chemical Trade Section of this Chamber, the Council of the Chamber should, upon the re-assembling of Parliament, put itself in communication with the Select Committee of the House of Commons having under its consideration the revision of the Sale of Food and Drugs Act, with the object of urging that a Board of Reference for appeal in cases of disputed analyses should be constituted, such Board of Reference, so far as drugs are concerned, to consist of at least four persons, being the nominees of (1) Inland Revenue Authorities; Somerset House; (2) Society of Public Analysts; (3) Medical Council of Great Britain and Ireland; (4) Pharmaceutical Society of Great Britain.”

LEGACY TO THE BENEVOLENT FUND.—We understand that a legacy of £100 has been left to the Benevolent Fund of the Pharmaceutical Society, under the will of the late William Hooper, of Camborn Lodge, Surbiton, and Russell Street, Covent Garden, a Founder of the Society. The total value of the deceased’s personal estate amounted to £57,101.

UNIVERSITY EXTENSION MANUALS.—In connection with this series of manuals, “An Introduction to Physical Science,” by Professor Cox, of Montreal, is in course of preparation.

A BRITISH PHARMACIST IN AUSTRALIA.—According to the *Australasian Journal of Pharmacy*, Mr. Sidney Plowman, F.R.C.S., has been appointed medical officer for the shires of Frankston, Somerville, and Hastings, Victoria.

CARBOLIC ACID AS A POISON.—We understand that Mr. Sydney Taylor, the Deputy-Coroner for North Derbyshire, has forwarded to the Priby Council a resolution of the jury at an inquest held at Rowley, on January 21, to the effect that carbolic acid should be scheduled as a poison.

NEW PHARMACY JOURNAL.—A new Belgian publication, the *Annales de Pharmacie*, conducted by Dr. Fernand Ranwez, will deal with practical pharmacy, pharmacognosy, chemistry, toxicology, microscopy, hygiene, and professional interests.

EVENING MEETING IN LONDON.—The next evening meeting of the Pharmaceutical Society will be held on Wednesday, February 18, when Professor Greenhalgh will deliver an illustrated lecture on the histology of psecocannha root, and Dr. Paul will exhibits and describe the alkaoids obtained by himself and Mr. Cowenley from the same drug. A demonstration will subsequently be given of the method of using Sir George Johnson’s “phiro-saccharometer.”

SOME POPULAR REMEDIES.—An interesting article under this heading appears in *Chamber’s Journal* for January 19. Cobweb, matico leaves, boiling tar, herb teas, St. John’s wort, the giant puff-ball, carrages, bladder-wrack, gelsemium, longe, cocaïne, and menthol are amongst the remedies treated on.

ROYAL SOCIETY ELECTIONS.—The *Technical World* remarks that the present method of electing the Fellows of the Royal Society is not ideal. That Oxford and Cambridge expect to get a certain proportion of the vacancies by wire-pulling the Council is said to be notorious. Unless a candidate is either a Don and wealthy, or possesses much patience, his chances are feeble. That patience is a virtue is manifested by the Oxford Don who tried patiently seven times and at last got in, whilst last year another such was successful after half-a-dozen “shots.” The quality or even the quantity of a candidate’s papers of original work are of very subsidiary importance, the main question being how many ‘Varsity friends or friends’ friends are on the Council.

A NEW DICTIONARY.—Dr. Fennell of Cambridge is to be the editor and general superintendent of the ‘National Dictionary of English Language and Literature,’ which will cover the period from the middle of the fourteenth century to the present day. Every quotation will have its date and reference, and the projectors announce that the dictionary will include a great number of authoritative words and phrases not printed in any book of its class.

OPIUM COMMISSION.—The Royal Commission on Opium began its sittings for the final revision of the report, at the India Office, on January 23. Lord Brassey was in the chair, and among others present were Sir James Lyall, G.C.I.E., Sir William Roberts, M.D., F.R.S., Mr. Wilson, M.P.; Mr. Mowbray, M.P., and Messrs. Fanshawe and Pease.

DEGREE FOR PROF. BURDON SANDERSON.—In a congregation held at Oxford, on January 29, the degree of doctor of medicise was conferred upon John Scott Burdon Sanderson, M.A., F.R.S, Fellow of Magdalen College, Regius Professor of Medicine, by degree of the House.
of the English Code for a Public Elementary School. In the Organised Science Day School every student upon whom the variable grant is claimed must be presented in the obligatory subjects of science, in the art subject, in at least one language, and also in some other or commercial subjects which have been approved in the time-table submitted to the Department. Not less than thirteen hours per week must be allotted to instruction in the sciences and arts subjects, and not less than ten hours for the other subjects, including two hours for manual instruction. The last condition will not come into force till after the year 1896. The most important feature of the new scheme is the introduction of payment on inspection instead of payment on results for by far the larger part of the instruction given in Organised Science Schools. This modification, which applies to 120 Science Schools in the United Kingdom, has only become possible since the appointment of a staff of Science and Art inspectors. It also appears that provision is made for a certain amount of literary instruction being given whilst the student is pursuing his Science curriculum; that greater freedom is given to the teacher as to the systematic order to be observed in the first two years of a student's course; that a choice of advanced courses is given; and that an alternative programme suitable for women is formulated, and instruction in subjects specially adapted to them is demanded; whilst practical instruction must be given in the subjects of Science simultaneously with the theoretical instruction. —Standard.

A SCIENTIFIC AERONAUTIC VOYAGE.—The last and most important scientific aeronautic voyage made by Dr. A. Benson in the balloon "Phoenix," on December 4 last year, is described by that gentleman in the Journal of Aeronautics and Atmospheric Physics. The ascent of the balloon took two hours and twenty minutes; the descent full three hours. The most important results were as follows:—1. The arrival at a greater height than was ever reached before—9150 metres; 2. The ascertaining of an unusually low temperature at that height, and a much greater lowering of the temperature between 1500 metres and 9200 than was ever before accepted for the winter; 3. A change of temperature mornings and evenings till the height of 1500 metres; 4. Relatively very weak insulation even at the greatest height; 5. Humidity in the highest regions, and fine mist in the sky to the enormous height of more than 18,000 metres; 6. Snow or structure of the ice as high as 9200 metres; 7. Tremendous increase of the swiftness of the wind upwards, for, with almost perfect calm on the surface of the earth, more than 310 kilometres were made in five hours seventeen minutes, which gives a medium swiftness of 164 metres per second.—Daily News.

PHARMACEUTICAL FOOTBALL CLUB.—A match was played on Saturday between the Pharmaceutical team and Stormont, on the ground of the former at Wormholt Farm. The Stormont eleven arrived late, and having won the toss, decided to play with the wind. From the kick-off the ball was passed out to Sewdy, who was playing outside on the right. He promptly took it down, and making a long shot from a very difficult point, scored the first goal for the home team. This seemed to make up the visitors, who pressed hard, and were dangerous for a while. Stodart playing in goal conceded a corner, but the ball fell behind. A second corner kick was obtained, but the ball was got away, the man receiving it from Stormont equalised, and the score at half-time was 1–1. During the first part of the second half the Stormont team played well and succeeded in adding another
goal, after which the combination among the Square men became rather loose, and their opponents conceived ideas of winning. The Pharmaceutical captain, however, seeing that Sawdy could do more if well backed up, changed Woodruffe from left half-back to right, when some remarkably well-combined play was shown by the right wing, consisting of S. B. Robertson, back; Woodruffe and S. B. Robertson, halves; and P. K. Allen, Smith, and Sawdy, forwards. Allen, playing in the centre, sent the ball down with a long kick, and following it up sharply easily scored, again equalising. Then Sawdy and Smith, by means of some clever passing, worked the ball down, and after some exciting exchange, the ball fell to Sawdy again scored, soon after which Bateson acting as referee blew the whistle, a well-contested game thus ending in the Pharmaceuticals winning by three goals to two.

CITY AND GUILDS OF LONDON INSTITUTE.—The Executive Committee of the City and Guilds of London Institute have awarded the first Salters' Company Research Fellowship for the encouragement of higher research in chemistry in its relation to manufactures to Martin O. Foster, Ph.D., F.C.S. Dr. M. O. Foster was a student at the City and Guilds Technical College, Finsbury, during three sessions (1888 to 1891), and has since graduated as Doctor of Philosophy (magna cum laude) at the University of Würzburg. For several months he has been engaged in investigating some new derivatives of camphor in the Research Laboratory of the City and Guilds Central Technical College, and by the aid of the Salters' Company's Research Fellowship he proposes to pursue this line of work.—Daily News.

SUPPOSED ATTEMPTED SUICIDE AT EXETER.—William Hare, well known as "Dr. Hare," made an attempt, it is supposed, to poison himself on Jan. 24. He went to the Victory Inn, St. Sidwell's, Exeter, at about lunch time, and called for a glass of ale. While sitting at the table he was seen to take out two bottles, one of which was labelled "Poison. Syrup of Poppies." He drank from it, and almost immediately afterwards he became unconscious. One or two in the room endeavoured to rouse him, but without success, and he was taken to the back of the house, and a cab sent for. Sergeant Dymond happened to be passing the house at the time, and was called in. On the arrival of a cab the driver refused to take the fare in consequence of the condition of Hare, who had been vomiting freely. His refusal was severely commented upon by the bystanders. Detective Dymond proceeded to the New North Road stand, and procured another vehicle, in which Hare was conveyed to Dr. Bell's residence, and medically treated. He soon recovered sufficiently to be removed to the Police-station. He will be charged with attempted suicide this morning. The unfortunate man is well known in the town. He formerly kept a chemist's shop in Paris Street, and rendered valuable assistance during the last cholera epidemic. After this he started a printing business, which was not particularly successful. A short time since Mr. Hare was given an alms-house.—Devon and Exeter Daily Gazette.

CASE OF ALLEGED IMPERSONATION.—At the Greenock Sheriff Court, on January 24 and 25, John Conner, druggist's assistant, sued William Cairns, medical practitioner, for £500 damages for slander, in that he had made statements to the effect that Conner had not passed the first examination of the Pharmaceutical Society, but had conspired with Francis Lambie, of Greenock, who passed the examination in his stead. Dr. Cairns first gave evidence to the effect that he had been told that Conner had not passed the examination, and that Lambie had been heard to say that he had personated Conner.—John Conner denied that he had been personated, and stated that he attended the examination and was successful in passing. Lambie only assisted him in his studies. Afterwards Lambie confirmed the evidence of the previous witness in these respects. When he told certain persons that he had passed Conner's examination he meant that he had "coached" him. Other witnesses then gave evidence as to having seen Lambie in the examination room at Edinburgh on the day in question, though they did not recognise Conner as having been present, and, ultimately, the case was taken in aviscandum.

BOYS BURNED BY CARBOLIC ACID.—Andrew Scott, aged 13, residing at 6, Mill Road Street, and William Dick, aged 14, residing at 5, Union Street, Calton, were treated at the Royal Infirmary on Wednesday, Jan. 23, for carbolic acid burning. The boys were employed in Wellpark Brewery. While in the place on Wednesday Scott took a capsule off a bottle, filled it with carbolic acid, in the belief that it was ink, and was about to throw it at Dick, when a third boy struck up his hand, scattering the contents of the capsule upon Scott and Dick, both of whom were seriously burnt about the face and neck. It seems that the boys had no right to be in the room where they met with the accident.—North British Daily Mail.

APPLICATIONS OF ELECTRICITY.—The Electrician in its issues of January 4 and 18 gives a mass of statistics concerning the progress of electrical industries—especially in relation to the application of electricity to lighting and power work. A sheet table shows at a glance the gradual introduction of electricity supply works, and a sketch map illustrates the systems adopted by the local authorities and companies who are responsible for the supply of electric current. Curves show the increase in "lampage" (i.e., use of the incandescent electric light) during the past four years, reaching the total of 1,125,000 in 1892. A colored map shows the areas allotted to the various metropolitan companies and local authorities, the thoroughfares through which the mains are laid, the position of the supply stations, etc., and letterpress in the same issue shows the capital outlay at present employed in the electric current. The rapid development of electric lighting enterprise may be said to date from January 1, 1893.

VICTORIA INSTITUTE.—At a meeting of the Victoria Institute, held on January 21, a paper on the Australian Flora, by Dr. Woolfs, whose botanical researches in New South Wales have extended over half a century, was read by Surgeon-General Gordon, C.B. In it Dr. Woolfs reviewed the history of botanical researches in that colony since the days of Banks, Salander, Finlander, Bauer, Caley, and Cunningham, and lastly the splendid work done by Von Mueller, whose list of the Australian flora extends to one thousand species. He described the classification of these, and concluded by referring to the debt due to Woods, Stephens, Wilkinson, and Sir W. Macleay. The paper was full of interest, not only to the botanist, but as an historical sketch of the work of the pioneers of civilization in the colonies. An interesting discussion ensued.—Daily News.

MR. C. GODDARD CLARKE, J.P.—Mr. C. Goddard Clarke, of Inglewood, Elm Grove, Peckham, who has just been made a J.P., has done good service to Cam-
berwell on its vestry and board of guardians. He is a member of the firm of Potter and Clarke, druggists, who are said to have one of the most varied and extensive stocks of crude botanical drugs in existence. Mr. Clarke was engaged in a dispute with his present employer, Mr. J. W. Cooke, of Ely, over the return of his wages, which he quaunders the Prince of Wales when he was a witness in the case. He is in the prime of life, and a tremendous worker. At present he is acting as treasurer of the Peckham Liberal Association, and has successfully fought the Progressive battle in the most Tory part of the constituency. He is a Nonconformist and Sunday School teacher, and has been a member of Mr. Spurgeon's Tabernacle for many years.—Star.

EDINBURGH CHEMISTS' BALL.—The twelfth annual ball was held in the Freemason's Hall, George Street, on the evening of Thursday 24th ult. Dancing commenced at 9 p.m. and continued till 3 a.m. On Friday, the music being supplied by Messrs. Dunn and Davidson's band. Messrs. R. Butchart and G. Melvin acted as M.C.s., and under their guidance a company of about eighty couples passed a very pleasant and enjoyable evening. At supper Mr. J. Laidlaw Ewing, chairman of the North British Branch Executive, proposed "Success to the Chemists' Ball," and Mr. D. MacLaren, convener of the Ball Committee, replied. Mr. MacLaren proposed "The Pharmaceutical Society," and Mr. Ewing replied. Mr. Peter Boa, chairman of the Edinburgh District Chemists' Trade Association was present, and also representatives from each of the wholesale drug houses in Edinburgh and Leith. Among those who, from a distance, gave their countenance and support were Messrs. Alfred Bishop and Sons, Burroughs, Wellcome and Co., Oppenheimer, Sons and Co., E. Rimmel, Johanniss Co., Fasett and Johnson, and Blendeau and Cie., London; Evans, Sons and Co., Liverpool; and R. Gibson and Son, Manchester.

IMPURE PRECIPITATED SULPHUR.—Colin Clant, trading as a druggist, at 20, Bolton Road, Small Heath, was summoned at the Birmingham Police Court, on Friday, January 28, for selling on December 13, to the prejudice of the purchaser, two oonses of precipitated sulphur containing 47 per cent, of sulphate of lime. The inspector under the Food and Drugs Act proved purchasing the sulphur which, according to the certificates of Dr. Alfred Hill, city analyst, contained 47 per cent, of sulphate of lime. Defendants said it was an old form of milk of sulphur, and was generally given when milk of sulphur was asked for. He and his brother had only bought the business a short time, and really had no time to go through the stock, but were assured by their predecessor that everything was according to the British Pharmacopoeia. He had only been in the trade thirteen years, but had only traded on his own account about a month. A penalty of 10s. and costs was imposed.

Press Comments.

OXFORD NATURAL HISTORY SOCIETY.—The meeting of the Oxford Natural History Society, held at the University Museum, on January 23, was successful in every way. The Society was first founded in 1890 by Mr. Druce, who came here from a district where one of the most successful societies of the kingdom was in full working order. For years the Oxford club remained in a somewhat dormant condition, but it has now started to "grow" in the life and beginning of half a score of ardent workers it has grown to a large and influential society. It numbers amongst its members many of the professors and distinguished scientists of the University, as well as enthusiastic naturalists, drawn from every section of Oxford's citizens. At the present moment the Society is considering a means for spreading the knowledge of natural history throughout the county, and with a balance in hand of £20, its financial position is satisfactory. Mr. Druce has been the principal principal for the survey of the country, but a more rewarding for his labours as one of the founders that Mr. Druce has now conferred upon him the highest honour at the disposal of the Society in the office of president for the ensuing year. Mr. Warde Fowler, the outgoing president, was very happy in remark co-operative that his pupils ought to know something about this work by birds, and he thought the following incident a good story for the success of Mr. Druce's year of office: On Sunday, while walking in Christ Church Meadows, he heard the song of the chaffinch, which was ten days earlier than he had heard it before.—Oxford Review.

'ANNUAL OF THE UNIVERSAL SCIENCES, 1894.'—Dr. Sejnow brings out once more his 'Annual of the Universal Sciences,' or yearly report of the progress of the general sanitary sciences throughout the world. (F. A. Davis & Co., New York; F. J. Reeman, London.) As before, he is assisted by seventy associated editors, and has two hand-written and collaborates. Every year it is a pleasing duty to notice this remarkable work, which, hitherto, has had no parallel, and is not likely, in our generation, to find any important rival. The volume is five in number, and the general index by Dr. B. Braden Kylle, of Philadelphia, and Messrs. Eugene Deveraux, A. M., and N. L. Devereaux, of Paris, is of itself a most curious study, extending over sixty closely printed pages. Such is the care taken by each editor in his department that the whole of the medical science for the year is introduced; and, as the basis of the information, the reference list of journals from which the highest in its kind becomes itself a kind of "index medicus" for the year, the value of which is historical.—Aeolus.

THE ELECTRICAL CONDUCTIVITY OF ORGANIC SUBSTANCES.—For the last ten years A. Bartoli has been investigating the electrical conductivity of organic substances, and publishing at intervals on his results. He now draws the following conclusions respecting the dependency of the conductivity of all the phatic salts on temperature:—At ordinary temperatures, or at the boiling point, the electrical conductivity of all phatic salts of small molecular weight is greater than those of the higher molecular weight. The conductivity of such salts increases with the temperature, the coefficient of increase of conductivity being greater for salts of high molecular weight than for their lower homologues; the temperature coefficient of the conductivity, therefore, increases as the viscosity of the salt increases. In the one or two cases in which the conductivity decreases with rise of temperature, the anomalous behaviour is explained by assuming the presence of a trace of an allphaltic alcohol. By adding such an alcohol the conductivity of a salt may be caused experimentally to decrease with rise of temperature. The electrical conductivity of a salt still increases as the temperature is raised, on adding to it aniline, paraldehyde, a phenol, a ketone, or an acid.—Electrical Review.

FOOT POWDER IN THE ARMY.—A year or two back a firm of wholesale druggists produced an "Antiseptic Foot Powder," and were fortunate as to obtain from the Horse Guards a letter signing H.R.H. the Commander-in-Chief's approval of the article, and recommending to all Commanding Officers that it should be kept on sale in canteens. The foot powder has since become the sole property of a company,
which sends out circulars accompanied by a facsimile of the aforesaid Horse Guards' letter. The puffing of a proprietary article in this way in the name of the Commander-in-Chief is a curious proceeding, and it would be interesting to know who the present proprietors of the article are. Under the circumstances one feels certain that the opinion of the writer would be supplied to the Army on specially favourable terms, but this does not seem to be the case. — *Truth.*

**A Novel Rat Poison.** Enormous business has been done lately at French fairs by a man who professed to have invented a rat poison. The prop of the concern was a powder in a box, and that struck rats dead on the spot. In order to convince the sceptical, the man first of all powdered a slice of bread with the stuff, and ate a piece of it himself. Then he put the remainder under a glass case, in which a rat was kept in captivity. The rats want to eat the bread and instantly fall dead. At five-pence a box the powder went off like hot rolls, and the lucky proprietor of the specific was in a fair way to make a fortune. But the police, who in France are very active in protecting the people from fraud, looked into the matter, and found that the powder was simply flour—ordinary flour. They also discovered that the case was connected with a powerful electric battery, and that the moment the rat touched the bread the current was turned on, and it was thus his death was brought about. The man was arrested at the fair of Albi, and he has been sentenced to fifteen days' imprisonment. — *Daily News.*

Mr. Justice Vaughan Williams.—In spite of the semi-official *démenti* on the subject, the news reaches us that the companies' winding up business is intended to be permanently transferred by the Lord Chancellor from Mr. Justice Williams to Mr. Justice Moir. The unsatisfactory state of business in the Queen's Bench Division is the pretext assigned for this contemplated change. The true reason, however, is very different. It is the annoyance given in high quarters by the firm, fearless, and admirable manner in which Mr. Justice Williams discharged his duty in the New Zealand Loan and Mercantile Agency Company case, and the fear that he may, in other pending matters, act with equal courage and decision. We hope Mr. Justice Williams will feel himself bound to state publicly the whole circumstances connected with his impending removal from the Court over which he has presided with such admirable success, irrespective of the legal profession and the commercial community. If motives of dehorsy restrain him from so doing, the task of exposing the deadly blow at the independence of the Bench which is involved in his removal, and of seeing that its would-be authors are called to account, may be foregone or pass into the hands of persons not so well informed. — *Law Journal.*

**Obituary.**

Notice has been received of the death of the following:

On January 8, Thomas Warburton, Chemist and Druggist, Atherton. (Aged 87.)

On January 13, Arthur Mason, Chemist and Druggist, Rochdale. (Aged 65.)

On January 15, Josiah Beecock Pratt, eldest son of Councillor Josiah Pratt, Chemist and Druggist, Stafford Street, Wolverhampton. (Aged 36.)

On January 20, Edward M. Watson, Pharmaceutical Chemist, Clifton. (Aged 71.) Mr. Watson had been a member of the Pharmaceutical Society since 1847.

On January 20, David Edwards, Chemist and Druggist, Bramhall. (Aged 61.)

On January 21, Charles Green, Chemist and Druggist, Brewood (Staffs). (Aged 63.)

**New Drug Companies Registered.**

**LONDON CHEMICAL COMPANY, LIMITED.**—Registered with a capital of £20,000 in 21 shares, to enter into an agreement with E. J. Ellis, and to carry on the business of chemical manufacturers, druggists, drysalters, oil and colourmen, etc. There shall not be less than two nor more than four directors. The first are E. J. Ellis and F. H. Hatchman. Each of one share. Subscription £156 each per annum. Registered office: Bow Bridge Wharf, Stratford, E.

**LUNGILL COMPANY, LIMITED.**—Registered with a capital of £5000 in 21 shares, to acquire and carry on the business of collectors, manufacturers, and vendors of a drug or medicine known as *Lungill,* now carried on at 85, Lucinda Hill, Birmingham, and to adopt an agreement, dated January 15, 1896, between H. J. McCubbin and others of the one part and G. Holbrook, for the company, of the other part. There shall not be less than two nor more than four directors; the first are to be appointed by the subscribers. Qualification, £100. Remuneration, 7% per cent. of the net profits, divisible.

**JOHANNIS, LIMITED.**—Registered with a capital of £141,000, in 21 shares (1000 deferred), to carry on the business as owners, lessees, or concessionaires of mineral waters, mineral springs; water impurities, wateriters, water manufacturers, licensed victuallers, brewers, and any other business which can be conveniently carried on in connection with the same. The first subscribers each take one share, and are: C. F. Hutchinson, L. Bliss, H. C. Povey, A. H. N. Good, J. A. Swain, B. W. Good, B. W. Good, G. S. Good, B. W. Good, B. W. Good, B. W. Good, B. W. Good, B. W. Good, B. W. Good, B. W. Good, B. W. Good, B. W. Good, B. W. Good, B. W. Good, B. W. Good, B. W. Good.

**ELECTRICAL OIL REFINING COMPANY, LIMITED.**—Registered with a capital of £20000 in 21 shares. Object, to adopt an agreement, dated January 21, 1896, between certain parties not named of the first part and H. W. Burrell, for the company, of the second part, and to acquire and develop certain patents relating to the bleaching, refining, sweetening, and purifying of oils and fats by means of electricity or otherwise. Registered without articles.

**New Books and New Editions.**

[Publishers are invited to forward particulars of new publications, including price.]

**A LABORATORY MANUAL OF ORGANIC CHEMISTRY.** By W. E. Oerstedt, A.B., Ph.D. Systematically arranged to accompany Keenan's 'Organic Chemistry.' (Heath and Co., London.)

**A TEXT-BOOK OF HYDRAULICS AND MECHANICS.** By H. W. Moore. (Sampson Low, Marston and Co., London.)

**THERMODYNAMICS.** By J. Parker, M.A. (Sampson Low, Marston and Co., London.)

**MEASUREMENT OF ELECTRICAL RESISTANCE.** By W. A. Prince. (Clarendon Press, Oxford.)

**DICTIONNAIRE D'ANALYSE DES SUBSTANCES ORGANIQUES INDUSTRIELLES ET CONSUMERIEES.** By Dr. Adolphe Bernard. (Baudry et Cie., Paris.)

**COLOUR VISION.** Being the Tyndall Lectures for 1894. By Captain W. de B. Arnet, C.B., D.C.L., F.R.S. (Sampson Low, Marston and Co., London.)
Poisoning Cases and Inquests.

Carbolic Acid.—Joseph Hanson, aged 44, died on Friday, January 18, at Rowley, from the effects of carbolic acid, self-administered. Verdict: “Deceased took carbolic acid whilst temporarily insane.” The jury also added a recommendation that carbolic acid should be scheduled as a poison.—Liverpool Mercury.

Rubinis’s Tincture of Camphor.—At an inquest at Exmouth, on Monday, January 21, the deceased, Marie Smerdon, was shown to have taken a large dose of Rubinis’s tincture of camphor. Verdict: “Death was caused by fatty degeneration of the heart, accelerated by taking a large dose of Rubinis’s tincture of camphor.” The jury also added a rider calling the attention of the public to the care which should be exercised in using the tincture of camphor, as there seemed to be an erroneous impression with regard to its strength.—Devon and Exeter Daily Gazette.

Laudanum.—John Patterson died on Tuesday, January 22, at Burrow, from the effects of an overdose of laudanum, self-administered.—Manchester Courier.

Laudanum.—Jane Holmes, aged 19, died on Wednesday, January 23, in the Infirmary at Doncaster, apparently from the result of drinking laudanum and some form of vermin killer.—Sheffield Independent.

Carbolic Acid.—Charles Cartwright, aged 43, died on Wednesday, January 23, in the Northern Hospital, Liverpool, from the effects of carbolic acid taken is mistake for medicine. Verdict: “Death from misadventure”—Liverpool Daily Courier.

Poisonous Liniment.—Thomas Arthur Rowe, aged 39, died on Saturday, January 26, at Worcester, from the effects of a poisonous liniment, which deceased used for various veins in the legs.—Birmingham Daily Post.

Carbolic Acid.—Charles Allen, aged 58, died as Saturday, January 19, at Farnshaw Street, Southampton, apparently as the result of drinking carbolic acid.—Southampton Echo.

Publications received.

ZUR KENNTNIS DER TOVARIACHEN. By G. Lagesheim. From the Author. Reprinted from the ‘Berichten der Deutschen Botanischen Gesellschaft.’

TABLES AND DIRECTIONS FOR THE QUALITATIVE CHEMICAL ANALYSIS OF MODERATELY COMPLEX MIXTURES OF SALTS. By M. M. Pattison Murr, M.A. Pp. 44. Price 1s. 6d. London: Longmans, Green and Co. From the Publishers.

RESOLUTIONS PASSED AT THE EIGHTH INTERNATIONAL CONGRESS OF HYGIENE AND DISEASE GRAPH. Pp. 53. From the Secretary General.

The Merck, Darmstadt. BERKTH SPREIS DAS JAN 1894. From the Firm.
Trade Notes.

MARCOL.—Under this name the Liquor Carnis Company, 28a, Farrington Street, E.C., has introduced a preparation which is described as consisting of the yellow marrow (96 per cent. of fat) of ox-bone to which has been added in physiological proportion, it is in the form of an 80 per cent. preparation of marrow, which contains haemoglobin and organic compounds of iron and phosphorus, and is more especially designed to serve as a fat food for adults. As such it should prove a distinctly useful preparation, and will probably be preferred, for it is decidedly palatable and not likely to be rejected by children or invalids. It is supplied in six-ounce wide-mouth bottles.

SOLAZET.—The agents for this well-known brand of stock liqueur, in submitting a sample of it, call attention to a recent examination, the result of which proved it to be pure extract of liqueur, free from any admixture of foreign matter.

LYNCH & Co.'s NEW CATALOGUE.—Like the business of the firm publishing it, this catalogue increases year by year. It now contains nearly 650 large quarto pages, and is freely illustrated throughout. To save trouble in ordering goods the latter bear distinctive numbers, reference to which is sufficient to ensure correctness of execution, and the index to the sections most frequently referred to is placed in the most convenient place for a catalogue, i.e., in front of the volume.

POCKET THERAPEUTIC NOTES.—This little work, published by Messrs. Ferris & Co., of Bristol, has now reached its second edition. It now contains more than 350 pages of notes on new drugs and remedies, and improved pharmaceutical preparations. As a price-list it is perhaps more likely to attract attention than many larger, though less attractive, publications.

CHANGE OF TRAVELLERS.—Messrs. Burroughs, Wellcome & Co. desire to notify the trade that Mr. C. Stanley Richards, who recently travelled for the firm in the South of England, has not been employed in that capacity since January 17 last.

ENEMA RACK.—Messrs. Reynold and Brandon, of Leeds, have just brought out a useful and simple enema rack, an illustrated description of which will appear later.

ACCIDENT TO MR. THONGER.—Mr. W. H. Thonger (representative of Mr. J. F. Wilkinson, Manchester), who has recently been the victim of a serious accident, has left the Birmingham General Hospital, and is now being attended at his home, Bearwood, by Dr. Middleton, of Harborne.

Patent Office Business.

APPLICATIONS FOR PATENTS.

[Compiled from the Illustrated Official Journal (Patents).]

Where complete Specification accompanies Application, an asterisk is suffixed.

No. 23,446.—Isidore Joseph Godenac, 58, Chancery Lane, London.—A carrier or holder for material for taking the impression or mould of jaws for dental purpose.* December 8, 1894.

No. 23,451.—Johannes Tabel, Wellaum, Mecklenburg-Schwerin, Germany.—Improvements in apparatus for measuring liquids. December 8, 1894.

No. 23,456.—John Alfred Whittard, 45, Southampton Buildings, Chancery Lane, London.—Improvements in respirators. December 8, 1894.

No. 23,462.—Frederick Trinder, 1, Furnival Street, Holborn, London.—A retinal dilator and irrigator.* December 8, 1894.

No. 23,500.—James Burwell, Abbey Grove, Lawon Road, Colwyn Bay.—An improved pinocer for dentists' use in lifting cases out of acid. December 8, 1894.

No. 23,511.—Roderick McLean Sanger and John Scott Sanger, 70, Wellington Street, Glasgow.—Apparatus for applying tooth-powder. December 8, 1894.

No. 23,577.—William Phillips Thompson, 6, Lord Street, Liverpool.—Improvements in, or connected with, the heating of fluids to a given temperature (Albert Doss, Germany). December 8, 1894.

No. 23,588.—Thomas John William Lott, 340, Leytonstone Road, London.—Furniture Polish. December 8, 1894.

No. 23,655.—William Phillips Thompson, 6, Lord Street, Liverpool.—Improvements in massage apparatus. (Martha M. Goets and Heinrich Simon, Germany).* December 9, 1894.

No. 23,686.—Ferdinand Kreuz, 37, Chancery Lane, London.—Machine for packing powdered materials.* December 9, 1894.

No. 23,711.—Claude William Parnell, Queen's College, Cambridge.—Adjustable combinations of lenses for optical instruments. December 9, 1894.

No. 23,728.—Clarence Fenton Slater, 20, Baker Street, Fortman Square, London.—An improvement in sprays. December 9, 1894.

No. 23,760.—Philip Benjamin Laeky, 70, Wellington Street, Glasgow.—An improved hypodermic syringe for dentists. December 7, 1894.

SPECIFICATIONS PUBLISHED DURING JANUARY.

Magnesium Hydrate (M. N. D'Andris).—Magnesia is produced by treating the mixture of lime and magnesia obtained by calcining dolomite with saline solutions, in which lime is said to be much more soluble than in fresh water. No. 24,666 of 1893.

Emboction (W. H. Simmons).—An emboction or limiment, suitable also for inhalation when added to boring fluid, is prepared by adding 38 lb. of eggs, olive oil, olive terebinthine, malt vinegar, tincture of spirits of hartshorn, lin. sapoins, oleum origanii, and spirit of camphor. No. 1341 of 1894.

Preparations of Coffees and Cocos (A. Lebrat).—Mixtures of condensed milk with coffee extract and chocolate respectively. No. 4049 and 4050 of 1894.

Supplying Liquids from Bottles (J. Maggi).—The bottle stopper or cap is fitted with a tube shaped somewhat like a match, but with an aperture at one end which, when it enters the bottle as the liquid is poured out at the spout. The flow may be stopped or controlled by wholly or partly closing the end of the side tube with the finger. No. 3883 of 1894.

Hair-dyes (A. Lamiere).—The hydrochlorate or other salt of diaminophenol is dissolved in dilute alcohol, with the addition of sodium sulphite to prevent too rapid oxidation when applied to the hair. By varying the strength of the solution, various shades from auburn to black may be obtained. No. 31,856 of 1894.

Vermin Killer (A. B. P. Wegemund).—A composition for destroying vermin on fowls, animals, &c., is prepared by mixing stated quantities of alcohol, aniseed oil, olive oil, rape-seed oil treated with charged union, castor oil, linseed oil, and almond oil. No. 21,816 of 1894.

Bed-sunrise for Females (R. A. Groves).—A specially-shaped bed-pan is described and illustrated by a drawing. No. 25,438 of 1894.

Resisting Antiseptics and Disinfectants (H. P. Morin).—The liquid is volatilised in a closed vessel, and the vapour passes through inclined nozzles against a pivoted vane which is thereby rapidly revolved and distributed. The vapo of the corrosive sublimate, etc., are forced by a pump through a groove or passage between two metal plates which are heated by a burner; both antiseptic and solvent are thus simultaneously volatilised, and issued together at the outlet.

Funnel (R. A. Brown and F. S. Bond).—The funnel has a gravitation valve which automatically closes when the bottle or other vessel to which it is applied becomes full. The valve prevents passage of liquid on removing the funnel, but again allows it to flow when applied to another bottle. No. 33,493 of 1894.
Diary of the Week.

[Notice for insertion under this heading should reach the Editor on or before Wednesday.]

SUNDAY, FEBRUARY 8.
Sunday Lecture Society, at 6 p.m.

MONDAY, FEBRUARY 9.
Royal Institution of Great Britain, at 5 p.m.
General Monthly Meeting.
London Institution, at 5 p.m.
"The Evolution of an Historical Picture" (Illustrated), by Seymour Lucas.
Victoria Institute, at 4.30 p.m.
"Insect Anatomy" (Illustrated), by Dr. Gerard Smith.
Society of Chemical Industry (London Section), at 8 p.m.

TUESDAY, FEBRUARY 10.
Pharmaceutical Society of Great Britain.
Benevolent Fund Committee.
Finance Committee.
General Purposes Committee.
Royal Institution of Great Britain, at 8 p.m.
"The Internal Framework of Plants and Animals" (Fourth Lecture), by Professor C. Seward.
Central London Throat, Nose, and Ear Hospital, at 4.30 p.m.
"The Methodical Diagnosis of Diseases causing Discharge from the Ears," by Dr. Dundas Grant.
Aberdeen Chemists' and Drugists', Assistants', and Apprentices' Association, at 9.30 p.m.
Paper by Mr. Pennie.
Society of Arts (Applied Art Section), at 8 p.m.

WEDNESDAY, FEBRUARY 11.
Pharmaceutical Society of Great Britain, at 11 a.m.
Meeting of the Council.
Society of Arts, at 8 p.m.
"The Labour Question in the Colonies and Foreign Countries," by Geoffrey Drage.
Geological Society of London.
"On the Physical Conditions of the Mediterranean Basin which have resulted in a Community of some Species of Freshwater Fishes in the Nile and the Jordan Waters," by Professor E. Hull.

THURSDAY, FEBRUARY 12.
Linnean Society of London, at 8 p.m.
"New Marine Algae from Japan," by E. M. Holmes.
Royal Institution of Great Britain, at 8 p.m.
"George Eliot, the Humourist, as Poet," by W. S. Lily.
London Institution, at 6 p.m.
"The Germination of Barley" (Illustrated), by A. Gordon Salaman.
Chemical Restaurants' Association, at 8.30 p.m.
Musical and Social Evening.
Liverpool Pharmaceutical Students' Society, at 8.30 p.m.
Glasgow and West of Scotland Pharmaceutical Association, at 8.15 p.m. Meeting.
"Notes on Revision of the Pharmacopoeia," by G. Leman.

Chemical Society, at 8 p.m.
"The Acidimetry of Hydrofluoric Acid," by Professor Haga.

FRIDAY, FEBRUARY 13.
Royal Institution of Great Britain, at 9 p.m.
"The Anti-toxin Serum Treatment of Diphtheria," by Dr. G. Simé Woodhead.
Royal Astronomical Society, at 8 p.m.
Annual General Meeting.
Sheffield Microscopical Society, at 8.30 p.m.
"Foraminifers," by Dr. Gordon.

SATURDAY, FEBRUARY 14.
Royal Institution of Great Britain, at 8 p.m.
"Hansel und Gretel" (with Musical Illustrations), by Sir A. C. Mackenzie.

Exchange. [Notices of books, apparatus, etc., for exchange, not exceeding thirty words, including name and address, are inserted free, but must not partake of the nature of ordinary advertisements.]

OFFERED.
Books.—Squire, 14th edition; Valentijn's 'Analysis,' 7th edition; good as new; sell cheap or exchange.—H. Smith, St. Luke's Grove, Southport.

'PHARMACEUTICAL JOURNAL.'—From 1878 to present time. Clean and in good condition; two years bound. What offers in cash or exchange?—W. S., 6, Sidney Road, Bonepse, N.

HERBARIUM SPECIMENS of Ferva, nardik, and East Indian and British medicinal plants.—Holmes, 17, Bloomsbury Square, W.C.

LANCASTER'S 4-PLATE CAMERA, less, two double-dark slides, and tripod. New condition. 29s. or exchange.—Tully, Chemist, Hastings.

DAVIS'S MEDICAL BATTERY and accessories in case. Quite new. Cost £21 10s., take 25s. J. E. Whitaker, 148, Sutherland Street, Barrow-in-Furness.

WANTED.
'PHARMACEUTICAL JOURNAL.—April 15, 1882, and May 6, 1883. Full price will be paid for clean copies by the Secretary, 17, Bloomsbury Square, London, W.C.

DRYED PLANTS.—Cephadilla speciosa (South America), with flowers and root; Pilocarpus species (South America), with flowers and fruits; Spheroanthus species (East Africa), with flowers and fruits.—Holmes, 17, Bloomsbury Square, W.C.

BENTHAM'S 'BRITISH FLORA.'—Second-hand.—Johnston, Chemist, 60, Loughborough Road, Brixton, S.W.

TOOTH-STOPPING INSTRUMENTS.—Modern, by good maker. Cheap.—Approval to W. Hindle, Chemist, Gurnion, Great Yarmouth.

Books.—Mahlb's 'Materia Medica,' and 'Principles of Pharmacognosy,' by Flückiger and Tschirch, in good order and latest editions.—O. T. Elliott, Belgrave, Leicester.

Trade Marks Applied For.

[Compiled from the Trade Marks Journal.]

188,143.—TREES STARS SUPERPOSED. Catonic soda.—Jacks Bros. and Co., 49, West Regent Street, Glasgow. September 11, 1894.

188,160.—DEVICE OF AN OBLONG CIRCLE-ENGRAVED LABEL, Bearing facsimile signature of the applicant. Chemical substances used in manufactures of philosophical research, and anti-corrosives.—Thomas Tyers and Co., Stirling Chemical Works, Abbey Lane, Stratford, London. October 22, 1894. The essential particulars are the combination of devices, and the facsimile signature.

[The quotations here given are in all cases the lowest net cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the pharmacist. It is important that this should be borne in mind, as it is sometimes between these prices and those of the wholesale drug trade.]

ACID, CITRIC.—Remains neglected at unchanged prices, but the market is very weak in tone. Offered from 1s. 12d. to 1s. 2d.

ACID OXALIC.—A fraction easier; still the prices are very fairly maintained. Manufacturers quoted at 8d. ex rail.

ACID, TARTRIC.—Both English and foreign makes are steady, but very quiet in demand. Returns: England, 10d. to 11d.; Foreign, crystals, 10d. 6d.; powder, 10d. 6d.

ALCOHOL.—There is a fair demand for good grades of Curaçao sloes at firm rates, which also applies to old Crapey varieties; rough, dirty, live parcels are, however, entirely neglected. Prices: Curaçao in gourds, 52s. 6d. to 63s. 6d.; good liver; Cape, 30s. to 31s., medium quality.

AMMONIUM SALTS.—SULPHATE: The market still continues very steady, high quotations somewhat in advance of last week. Present quotation: grey, 24 per cent., £1 9s. 3d. Carbonate very steady, prices advancing somewhat in accordance with those of sulphate. Quotation, 8s. 6d. to 9s. 6d.

ASHES.—Pearl are very steady at a slight advance, quotations now being 40s. for American, with pots at 53s.

ARSENIC.—Quiet, but steady. Powdered white is still worth from 1s. 6d. to 1s. 8d.

BALSAM CAPILLAR.—Steady at last week's rates, varying from 1s. 6d. to 1s. 7d., the latter being readily obtainable for good Manxman.

BALSAM, PERUV.—Small demand at 6s. 6d.

BALSAM, TOLU.—Flat. A good grade commands 1s. 2d.

Bleaching Powder.—Steady at unchanged prices in a quiet market. Quotation, 6s. 6d. to 6s. 9d.

BORAX.—A fairly brisk market, but prices remain unchanged at 30s. for crystals and 31s. powdered.

CASCARELLA.—Very steady, the advanced prices being maintained. Bold, part silvery bark is quoted at 52s. to 53s.

CINCHONA.—Bark market, attributable to speculative buying. The supply was poor, but wherever obtainable was readily bought up, the prices given being 1s. 2d. to 1s. 3d. for black, and 1s. 6d. to 1s. 7d. for silver.

COFFEE SULPHATE.—Although last week's tendency to a further advance has not been continued, the prices remain very steady, varying from £1 15s. to £1 15s. 6d., according to brand.

CREAM OF TARTAR.—In good demand with strong upward tendency. Fine white crystals command 64d. ditto powdered, 6s. 6d. to 6s. 7d.

GUARACU.—Very quiet, due to the poor quality of that offered, which is mostly drosey block, fetching from 3s. 4d. to 3s. 6d.

HONEY (Jamaica).—In small demand only at somewhat easier prices.

IPRICACUNHA.—Prices are still low, Carthagena root fetching from 2s. 6d. to 2s. 8d.

JAPAN.—Quoted, but little root of fair quality offered.

Quotation, 1s. 4d. for fair Vera Cruz.

KOLA NUTS.—Steady. South American nuts of good bold quality are worth 1s. 4d. to 1s. 6d.

LIMESTONE.—Above average of 1d., the amended prices being: Calomel, 2s. 6d.; red precipitate, 8s.; white do., 8s.; corrosive sublimate, 2s. 6d.

OILS (fixed).—Linseed is steady at £2 10s. 6d. landed.

Cotton: A trifle easier, ranging £1 7s. 6d. to £1 8s. 10d.; Cocos- wax: Steady; Ceylon, £2 23s.; cochineal, £2 5s. Rape: Firm, unchanged; refined being still worth £2 1s. Turpentine: Quiet, a trifle easier; American spirit being offered at 20s. 10d. Petroleum: Unchanged; American, 4½d. to 4½d.; Russian, 3½d. to 4d.; petroleum spirit, ordinary, 7d.; deodorised, 7d. to 7½d.

OPium.—The market is quiet; still the prices are well maintained and in some cases higher. Holders of Persian are firm, and there is considerable demand for it, although sales are only small. Turkey, best selected, 12s. 6d.; best seconds, 11s.; "druggists," 10s. to 11s.; Persian, 11s. to 12s.

PEPPER.—Very steady, although business done is but moderate. Quotations for fair quality average 8½d.

POTASH COMPOUNDS.—Prices steady. Prices show that last week's decline has been maintained, although it has touched 10½d. Closing quotations, 10½d. to 10¾d. The remaining compounds are mostly at the old rates. Chlorate, 5d.; Bichromate, 4d. to 4½d.

QUASSIA.—Very steady. Business moderate at increased prices up to 24 17s. 6d.

QUICKSILVER.—Prices very fairly maintained. In first hands prices rule 26 12s. 6d.; in second hands 25 11s.

QUININE SULPHATE.—Market very dull and little doing. Holders of German makes at second hand quote at 11d.

SHELLAC.—In slow demand privately, and sales are but small, the basic being 107s. for TN orange, whilst Garnet is quoted at 108s. At Tuesday's sales the supply was small and competition good. No Garnet was offered. The prices realised show an advance of 1s. to 2s. on the last sales.

SODA COMPOUNDS.—Cautious in improved demand, prices ruling from £2 to £2 10s. for 70 per cent. white, with 21 les. for 60 per cent. Crystals are stationary at 52s. 6d. for windowed, £1 13s. 6d. for unwindowed.

CHILLIES.—Very quiet. 135 bales of medium Zanibari were all bought in at 28s.

CLOVERS.—Very little doing, no Zanibari offered. Picked Pensam bought in at 7½d. Some sales of low pickings 1898 import at 2½d.

GINGERS.—Cochin: Supplies only small, and sales but slow. Quotations: Shrivelled pickings, 25s. 6d.; good bright medium, and small washed, 35s.; good bright washed, 70s. Japan: 25 bags of lined offered without reserve fetched 20s. African: Without reserve, 25s. 6d. to 25s. 8d.

GALLES.—Market very steady, with a tendency to advance. Spot sale, 50sh., with good business in arrival sales.

INDIGO.—The first quarterly auction of the year was held on the 28th and 29th inst., when 5,000 chests were offered, the bulk consisting of lots bought in at the October sale. Prices varied considerably, but closed very firm, the quotations generally showing an advance on those obtained at the last auction.

Amount and result of January sales:—

Late News.

EDINBURGH DISTRICT CHEMISTS' TRADE ASSOCIATION. — A meeting of the Association was held in the Pharmaceutical Society's House, 36, York Place, Edinburgh, on Tuesday, January 29, at 9 p.m., Mr. Peter Beca, President, in the chair.

The minutes of last meeting were read and approved. The Association went into committee to consider the question of the legal sale of certain gases in the form of photographic chemicals and antisep tic preparations, and it was remitted to the Committee with powers to make enquiry and take any action that might be considered necessary.

A discussion then took place as to the desirability of communicating with medical men in reference to the prescribing of stamped medicines, and it was remitted to the Committee to draft a circular to be submitted for approval at next meeting.

Mr. Henry, the Secretary, then drew attention to the sale of crushed linseed cake for linseed meal. Recently a professional nurse in his district had complained that he did not supply the best linseed meal. He found she had been accustomed to see the crushed linseed cake employed in connection with a public institution where she had been trained. What he supplied was the finest ground linseed containing the oil. He was requested to procure some of the correct (i) article, and on applying to an ordinary tradesman (not a chemist) for linseed meal he was supplied with the ordinary crushed linseed cake, minus the oil, without any hesitation. He had had a similar complaint made by a medical practitioner, who said the linseed meal he supplied was not the best, as he had looked up the cases and found that recently a person had been convicted in Perth for selling crushed linseed cake as linseed meal, the prosecutor maintaining that the ground linseed of the Pharmacopoeia alone could be sold as linseed meal. They could not supply crushed linseed cake as linseed meal without becoming liable to a penalty under the Food and Drugs Act. Crushed linseed cake appeared to be very extensively sold as linseed meal, and even doctors and nurses seemed to think it was the best article. It was annoying to find that such persons were saying one did not sell the best linseed meal when the direct contrary was the fact.

It was agreed that the report of what had been said should be communicated to the journals and newspapers, so that attention might be called to the subject.

The meeting then closed.

INSTITUT OF CHEMISTRY OF GREAT BRITAIN AND IRELAND.—The following are the names of the candidates who passed the examination of the Institute held in January, 1886:—

A. E. Bell, Owen's College, Manchester, and Royal College of Science, South Kensington;
C. S. Elles, Owen's College, Manchester, and University College, Aberystwith;
M. O. Forster (Ph.D., Wurzburg), Finsbury Technical College;
J. Lounes, Mason College, Birmingham, and registered student under A. E. Tucker, F.I.C.;
G. H. Russell, Yorkshire College, Leeds;
W. H. Sodeau, King's College, London;
W. L. Sutton, University College, London;
W. G. Young, University College, London, and registered student under W. C. Young, F.I.C.

Technical Notes.

[From the Technical World.]

The following is a proposed solder for use with aluminium or aluminium alloys, invented by Mr. B. J. Roman. Silver, nickel, aluminium, tin, and zinc are mixed in the following proportions: silver, 2 per cent; nickel, 5 per cent; aluminium, 9 per cent; tin, 32 per cent; zinc, 50 per cent. No flux is necessary, and any soldering iron or tool may be used, though one of aluminium is said to be preferable.

A new process of extracting gold from auriferous ores, by means of bromine, has been elaborated by Herr C. Lorenzen. He electrolyses a solution of potassium bromide, and obtains an alkaline solution which contains hypobromide and bromate, which is capable of dissolving gold. The ore is treated with excess of this solution by rotating cylinders; the solution is then filtered, the gold precipitated by passage over a mixture of iron and coal, and the solution, which now mainly contains potassium bromide, is electrolysed once more, and again used for extraction.

Ferric sulphate and lime are again coming to the front in the treatment of sewage. Manganate of soda has held the pre-eminence for a considerable time now, but, as the result of recent experiments, it is probable a larger trial will be made of the former, and that they will be found to yield more satisfactory results than are obtained at present.

The process of manufacturing calcium carbide by heating in an electric furnace a mixture of coal dust and lime is now well known. The appearance of this material in masses resembles the mineral serpentine, being of greenish-grey colour, with a lustre like feldspar. If a few drops of water are thrown on to this screeching rock, gas is given off, which, if ignited, burns with a brilliant flame, and will continue to burn, if supplied with water, until the mineral is exhausted. It is proposed to use the gas thus produced for local gas-engines. A charge of the mineral is placed in a closed vessel, in which a regulated supply of water is admitted. A little water entering evolves a quantity of gas, whose pressure shuts off the water, and as the gas is exhausted more water is admitted to renew the supply. Whether the cost of producing this compound in an electric furnace would be so much as to allow of its industrial application remains to be proved: but it would be of use in certain cases where the economic question was not controlling, and it is certainly a very curious compound.

WANTED, Assistant with Minor qualification, about 35 years of age, for a Mixed business. Please send photo and all particulars as to age, height, salary required, and references, to THOS. KNOWLES HAY, Chemist, Hebden Bridge, Yorkshire.

WANTED, Assistant. Good class country: 2 years last 3 years' previous situations. Age 23. Height 6ft. 1in. Bo, Woolridge, Billingham.

WANTED, Assistant, Perfectly comfortable home, for principally morning duties. Good experience required. No salary. F. C. P. 10, Shrewsbury Rd., Baywater.

AS JUNIOR OF IMPROVE. Age 21. 5 years' experience. Good references. WINDHAM, 18, Elmstone Rd., Fulham, S.W.
Notes.

EVENING MEETING IN LONDON.—At the evening meeting of the Pharmaceutical Society, on Wednesday next, February 13, Professor Greenish will contribute a paper on "The Histology of Ipecacuanha," which will be profusely illustrated by lantern slides. After wards Dr. B. H. Paul will deal with "The Chemistry of Ipecacuanha," and exhibit specimens of the three alkaloids extracted from the drug by Mr. A. J. Cowenley and himself. The makers of Sir George Johnson's "Picro-Saccharometer" have also promised to give a practical demonstration of the method of employing the instrument. The President will take the chair at eight o'clock.

EVENING MEETING IN EDINBURGH.—At an evening meeting of the Society to be held in the Society's House, 36, York Place, Edinburgh, on Friday, February 15, Dr. Ralph Stockman and Mr. D. B. Dott, will contribute a paper on "Ricinoleate of Magnesia," and Mr. Dott will also read one on "The New British Pharmacopoeia." Mr. J. Laidlaw Ewing, Chairman of the Executive of the North British Branch, will take the chair at 8.30 p.m.

CHEMISTS' ASSISTANTS' ASSOCIATION.—The seventeenth annual dinner of this Association will be held at the Cannon Street Hotel, on Thursday, March 7, at 8 p.m. Mr. Walter Hills, of the firm of John Bell and Co., will act as chairman on the occasion.

JUNIOR PHARMACY BALL.—Readers are reminded that this ball will be held at the Portman Rooms, on Wednesday next, February 13, at 9 p.m., and that application for tickets should once be made to Mr. H. A. R. Robinson, 29, Chapel Street, Bolgrave Square, S.W.

ANTIDOTE TO CHLORAL.—In the Glasgow Medical Journal for February, Dr. J. Dougall suggests that if potassium hydrate in sufficient quantity could be safely administered in cases of poisoning by chloral, there are strong a priori grounds for assuming that in about fifteen minutes the chloral would be entirely decomposed into potassium formate and chloroform. He is of opinion also that 7 grains of KHO, equal to 112 minims of liquor potassae, might be given without fear of causing untoward symptoms, if highly diluted, and by this means 20 grains of chloral would soon be decomposed.

THE OPIUM COMMISSION.—Extra sittings of the Opium Commission are being held with a view to issuing the official report by the end of the present month.

NEW EDITION OF THOMPSON'S 'ELECTRICITY.'—This week Messrs. Macmillan and Co. issue a new edition of Professor Silvanus Thompson's 'Elementary Lessons on Electricity and Magnetism.' The work has been almost wholly re-written, and many new illustrations have been added.

DEATH OF MR. S. M. BURROUGHS.—We learn with regret, from Mr. Henry S. Wellcome, that Mr. S. M. Burroughs, of the firm of Burroughs, Wellcome and Co., died at Monte Carlo on Wednesday morning from pneumonia.

'CANADIAN DRUGGIST.'—The office of the Canadian Druggist has been removed from Strathroy to Toronto, Ontario, simultaneously with the commencement of its seventh volume.

SUPPLEMENT TO THE CODEX.—The last edition of the French Pharmacopoeia—the 'Codex Medicamentarius'—was published in 1884, and a supplement to the volume, which has just been issued, comes none too early. It contains a table of the densities of mixtures of water and absolute alcohol at 15°C., together with additions to the four parts of the Codex—crude vegetable drugs, chemicals, galenicals, and veterinary preparations.

RUMFORD PRIZE FUND.—The special thanks of the members of the Royal Institution were voted to Professor Dewar, at the monthly meeting on Monday last, for his donation of the Rumford Prize Money to the fund for the promotion of experimental research at low temperatures.

SHOULD DOCTORS DISPENSE?—A somewhat heated controversy on this subject has recently engaged the attention of medical men, pharmacists, and the general public in the Birmingham daily papers. One of the letters published is reprinted at page 36 of the Supplement, and part of a very pertinent editorial note appears at page 38.

'KERNER'S NATURAL HISTORY OF PLANTS.'—The tenth part of Oliver's translation of this comprehensive work deals with the structure of the flowers and the numerous devices found in plants for self-protection, distribution of pollen, and fertilisation. It is prefixed by a handsome coloured plate representing the Vitoria regia in the River Amazon.

PEAS WITH HONOUR.—Under this heading a Clifton correspondent sends information that the case in which a grocer was charged with adding copper to green peas, originally heard at the Bristol Police Court on Friday, January 11, was dismissed (see Supplement, p. 18).

APPOINTMENTS.—Mr. W. Baker, of Lewisham High Road, has been appointed Divisional Secretary of the Pharmaceutical Society for Deptford, in succession to Mr. Dymott, who is retiring from business, and Mr. Frederick Carter, of Carshalton, has been appointed Local Secretary for the Carshalton district.

CASE OF ALLEGED FRAUD AT GLASGOW.—Judgment was given in the Greenock Sheriff Court on February 6 in favour of the defendant, in the case of Conner v. Cairns, with expenses against the pursuer.
Legal and other News.

[Readers are invited to send local information of pharmaceutical interest. When newspapers are sent the paragraph to be noted should be plainly marked, whilst cuttings should be verified by the addition of source and date.]

COLLECTIVE INVESTIGATION CONCERNING ANTITOXIN.—An official investigation of the results of sero-therapy will be made by the German Imperial Government. The hospitals of any significance throughout the Empire are invited to take part. They must give a minute account of every case treated; if bacteriologists' examination was performed they must say if only Lister's or other bacilli have been found; also they are asked if the curative effect of antitoxin was certain, probable, or not at all remarked. The answers are to be sent to the German Imperial Health Office, where they will be collected and published. Another collective investigation will be made by the Deutsches Medicinische Wochenblatt, but this is not confined to hospitals only, but extends to all practitioners in Germany. Cards have already been sent to them with the following questions:—How many of your patients were treated with, and how many without, antitoxin? How many in both these categories recovered, and how many died? There are special columns for the sex and age of the patients, and the complications are also to be reported. The scientific and statistical work will be done afterwards by a committee, whose principal members are Professors Behring, Leyden, Heinbe, and Ehrlich, and some other leading men. —Exeter.

SOCIETY OF CHEMICAL INDUSTRY.—A meeting of this Society was held at the Victoria Hotel, Manchester, on February 1, the President (Mr. P. F. Carpenter) presiding. —Mr. J. Carter Bell, the secretary, read a paper on "Fractional Distillation and its Results," in the absence through illness of Professor Wanklyn, the author. Mr. Bell exhibited a specimen of debased rubber tubing, which, he said, contained only 10 to 15 per cent. of india-rubber. He remarked upon the possible danger to human life from gas leakage through such tubing, as adulterated rubber was easily fractured. Mr. Scudder exhibited a sample of rubber carbidic, which, when the acid carbonic of water, evolves acetylene gas. Some discussion ensued as to the possibility of using acetylene thus prepared as an illuminant. —Manchester Guardian.

ADULTERATED TINCTURE OF RHUBARB.—At Halifax on Saturday, Feb. 4, Henry Johnson, grocer, Elland, was summoned under the Adulteration of Food and Drugs Act for selling adulterated tincture of rhubarb. Mr. Brutton, on behalf of the West Riding County Council, said this article more than any other was sold in an adulterated state in the West Riding. A sample obtained at the defendant's shop was found on analysis to contain less than one-third of the strength of the spirit directed by the British Pharmacopoeia, and to be entirely destitute of saffron. The label on the bottle from which the sample was taken said: "Best compound tincture of rhubarb, made from the genuine root. Buy only from recognized chemists, and so avoid cheap and nasty imitations." Mr. W. Storey, for the defence, contended that the inspector who got the sample was told that the defendant had only the compound tincture, and he asked him to read the label on the bottle. The contents of the bottle were obtained three years ago from Mr. Waterworth, of Preston, who were written suffering to pay the expenses of a solicitor to defend the case, and expressing his sorrow that the defendant had been put to such annoyance "through no fault of his own." The Bench said the Act was passed to protect those who could not help themselves, and the defendant would have to pay £2 fine, with 18s. costs, and the analyst's fee. —Manchester Guardian.

PROPOSED MEMORIAL TO THE INVENTOR OF FRICITION MATCHES.—Mr. Registrar Crosby recently presided at a meeting in the Town Hall, Stockton, convened to take steps to promote a memorial to the late Mr. John Walker, chemist, Stockton, who invented the friction match. Ald. Sanderson, J.P., was appointed president of a committee, and a number of influential gentlemen were appointed vice-presidents, an executive being also appointed. As a recommendation to the latter committee, the following resolution, moved by Mr. Joseph Parrott, to whose efforts the movement is due, was adopted:—"That the proposed monument consist of a temple, after the design of the Roman temple of Vesta, in which, among other things, there shall be a series of representations on the outside, in bas-relief, illustrating the history of the methods of obtaining fire and light by different peoples in ancient and later times; that the detailed elaboration of such a design be left to the Executive Committee, acting on the advice of such competent persons as they may think fit to consult; that estimates be procured and subscriptions invited." —Yorkshire Herald.

CHEMISTRY OF THE ATMOSPHERE.—Mr. J. A. Wanklyn writes as follows in the Daily Telegraph:—"It is not the first time that, within my own experience, the organisation of our Royal Society has been employed to give currency to a myth. On a former occasion it was a so-called calculus, wherein the symbols of mathematics were used so as to stifle—instead of to elucidate—the application of the principles of chemical questions. Now we are informed that about 1 per cent. of the volume of the air, or that about 1 per cent. of its weight, consists of a new substance. The experimental result, however, is that only about one-twentieth of 1 per cent. is exhibited. As I was not one of the invited, I could not attend in person at the meeting on Thursday last; but I have read the published reports, and I see no reason to alter my opinion as to the part which nitrous oxide bears in the chemistry of the atmosphere." —

SHOULD DOCTORS DISPOSE?—Under this heading a correspondent of the Birmingham Daily Mail says:—"Such a monstrous state of things is not for a moment condoned by the Lancet, nor is there any reason to think that the English Government should allow a man the privilege of writing out death certificates, and yet at the same time sanction his dispensing the medicine for his patients, is beyond all conception. I would submit three important suggestions why doctors should not dispense, and these, I think, must appeal to any intelligent person. (1) It is a violation of the conditions under which the English Government will give certificates of death and disperse medicine at the same time. (2) Their insufficient knowledge of dispensing; the knowledge of pharmacy and practical dispensing required for their examinations not being a tenth part of that required by the Pharmaceutical Board of Examiners. (3) Their liability to substitute cheaper medicines than those which would be of greatest value to the patient in order that their drug account may be kept down. Now, these are not fanciful ideas but bare facts, which my own impartial experience indicates, and of which I have constantly seen the result. Of course, the patient is the sufferer, and I always take great care that my medicine is never dispensed in the slobbery manner carried out in so many of our doctors' surgeries."
SUPPLEMENT TO THE PHARMACEUTICAL JOURNAL AND TRANSACTIONS.

VICTORIA INSTITUTE.—A meeting of this Institute took place on February 4, when Dr. Gerard Smith delivered a lecture on the structure of insects, in which he described the various species and their nervous systems, from the most highly organised to the simplest. The following is a note to indicate those lines which seemed to separate the various species, and his remarks were illustrated by numerous microphotographs shown by oxyhydrogen light.—Daily News.

NATURAL HISTORY IN THE CITY.—The annual conversations of the City of London Entomological and Natural History Society, held on February 5 at the London Institution, was a brilliant success. The Society began its career about forty years ago in a very humble way, holding its meetings, with less than a dozen members, in a tavern room in Harrogate; but it has now increased so rapidly that it is now flourishing on a firm foundation, and housed in the well-known institution in Finsbury Circus. It has for its objects the diffusion of natural history by means of papers, discussions, exhibitions, and the formation of collections for reference, and at the fortnightly meetings a special feature is the systematic discussion and exhibition of interesting genera of insects. Mr. J. A. Clark is again both President and treasurer, and the hon. secretaries are Mr. C. Nicholson and Mr. A. U. Battley. Amongst the company at the conversations were some of the naturalists who have recently maintained the interesting correspondence in The Daily News upon the Camberwell Beauty, some fine specimens of which were exhibited. Amongst the Lepidoptera were a splendid collection of the great Copper butterfly, which used to be taken in the hands, but for some reason or other, probably not a little on account of new systems of drainage and the merciless zeal of the collector, the species as a British butterfly became extinct about fifty years ago. The exhibitors of these butterflies, Mr. T. Hanbury, a member of the committee, brought from Italy, for the express purpose of the soirée, a number of recently-gathered fruits and flowers, including almost every variety of the citrus family. The garden presented a large round table, and were one of the most popular attractions of the evening. In one recess of the library were three perfect specimens of wasp's nests (Vespula britannica), one of them presenting the curious form of being built in Scotch heather. The classified and large collection of dried specimens of rare or extinct British plants were worthy of much better study than the members and visitors could bestow upon them in a hall where there were so many interesting objects, to say nothing of the music and conversation, to divide attention. Perhaps to ornithological students the most priceless exhibits were found in the cabinet drawers in which Mr. Elisha treasures his tiny moths, the micro-lepidoptera, insects which are the widest contrast that could be pitted against the three great Goliath beetles of Africa. There were cases of birds, reptiles, and small mammals on view, and a great variety of shells and geological curiosities. The London Institution had kindly lent the Society for the night the most interesting and rare books on natural history from the library shelves, and a new invention of his own in connection with micro-photography was shown and explained by Dr. W. A. Ribbier.—Daily News.

SALE OF DEFICIENT SPIRIT OF NITROUS ETHER.—At the Bridgnorth County Petty Sessions on Saturday, February 2, Richard Wilson, chemist, Claverley, was summoned for an infringement of the Food and Drugs Act by selling to Police-constable Roberts six ounces of spiritus etheris nitrosis (spirits of nitre) which was not composed of ingredients in accordance with the demand of the purchaser. On the 9th ult. the constable, under the direction of the Chief Constable of Shropshire (Captain Freeman), visited the defendant's shop, at Claverley, and purchased from him 6 oz. of spiritus etheris nitrosis, for which he paid eightpence. On analysis, the sample was found deficient in nitre to the extent of about 50 per cent., the alcohol being deficient by 24 per cent. The defendant admitted that the drug supplied was not in accordance with what was demanded, but urged that the constable did not take proper precaution to retain the strength of the sample in its transmission to the analyst. The Bench fined the defendant £1, including costs.—Midland Evening News.

ABERDEEN AND NORTH OF SCOTLAND SOCIETY OF CHEMISTS AND DRUGGISTS.—The annual dinner of the Aberdeen and North of Scotland Society of Chemists and Druggists was held in the Douglas Hotel, Market Street, on Thursday evening, January 31, Mr. John Johnston (President) in the chair, Messrs. James Paterson and N. Davidson couplers. After doing ample justice to a dinner purveyed in Mr. Stott's very best style, the following toasts were submitted and duly honoured:—"The Queen and the Prince and Princess of Wales, etc.," from the Chair; "The Pharmaceutical Society," proposed by Mr. John Orlickbank, responded to by Mr. Johnston. "The Aberdeen and North of Scotland Society" was proposed by Mr. Tocher, Peterhead; Mr. James Paterson responded. Mr. Andrew Craig gave the toast "Aberdeenshire Association," and Mr. Tocher replied. "Town and Trade of Aberdeen" got ample justice in the hands of Mr. Giles and Mr. Ritchie. Mr. William Davidson proposed "The Health of our Chairman," and Mr. Johnston suitably replied.

SEQUEL TO THE KESTING CASE.—In the Scotsman of Saturday, February 2, the following advertisement appeared under the heading "Kesting v. McCullum":—I, Thomas Kesting, Insect Powder Manufacturer, London, hereby withdraw the complaints of fraudulently selling as and for Kesting's Powder, powder not manufactured by me, and other charges preferred against Alexander Inglis McCullum, chemist and veterinary surgeon, 19, Grassmarket, Edinburgh, in the Record in the action of suspension and interdict recently raised by me against him in the Court of Session, and I regret that said charges should have been made.—Thomas Kesting, January 22, 1895. We are informed that Kesting has, in addition, paid £50 to McCullum, the sum awarded in the case Foster v. Kesting, recently decided.

SILVER MEDAL FOR MR. W. L. HOWIE.—In the Edinburgh Photographic Society's Exhibition at present being held in the Society's Rooms, 38, Castle Street, Edinburgh, the silver medal for landscapes, half-plate and under, has been awarded to Mr. W. Lamond Howie, our local secretary at Bọcies. Among the pictures recently exhibited, the following are indicated: enlargement from two quarter-plate negatives by Mr. Howie, showing an extensive view of Balmoral deer forest from Lochnagar.

Silver Medal for Mr. W. L. Howie.—In the Edinburgh Photographic Society's Exhibition at
Press Comments.

A LOCALISED HOT-AIR BATH.—A new method of treating sprains, stiff and inflamed joints, and similar affections has been adopted at St. Bartholomew's Hospital, after prolonged trial in the wards by Mr. Alfred Willett, F.R.C.S., and has also been successfully tested by Mr. Mayo Collier at the North-west London Hospital. These credentials leave little doubt that Mr. Tallerman’s inhalation and local apparatus will be a really valuable addition to our present very imperfect means of dealing with a peculiarly troublesome and unsatisfactory class of cases. There is nothing in the least mysterious about this hot-air bath; it is merely a novel and legitimate development, with some particular advantages, of that familiar method of treatment by means of the local application of heat, which forms one of the fundamental principles of professional and domestic surgery. In other words, it acts like a poultice or a hot-water fomentation, but more powerfully, and with some special effects in addition which are not obtainable by means of moist heat. The use of dry air permits of the application of a fairly superficial temperature, and, at the same time, effects the removal of morbid products by profuse exudation and evaporation through the skin. The apparatus consists of a copper cylinder about 3 feet long and 18 inches in diameter, which comfortably accommodates an arm up to the shoulder, or a leg up to the middle of the thigh. It stands on an iron frame, and is heated by gas burners placed underneath, so that the temperature can be gradually raised up to 300° or even 400° Fahrenheit. The patient sits in an armchair opposite one end of the cylinder, which is placed at a convenient height, and inserts the limb to be treated through an indiarubber curtain attached to the aperture. The limb rests comfortably on felt pads inside the cylinder, and the position can be maintained with ease for an indefinite time. It is found that patients usually prefer a temperature of about 150° to begin with, and a gradual rise up to 250°. No discomfort is felt at this temperature until perspiration occurs, when the moisture has a scalding effect, which is at once removed by opening the further extremity of the cylinder and allowing the moisture to escape by evaporation. A sitting usually lasts for forty minutes or more, and its immediate effects are an improved circulation in the limb, which becomes bright red, a profuse local perspiration, and a slight rise in the general temperature of the body, also accompanied by free perspiration. The treatment has been applied with striking successes to cases of both chronic and acute inflammation of the joints, whether due to gout, rheumatism, or injury. In acute cases the first effect, and in the patient’s eyes the most important, is the immediate relief from pain.—Standard.

ABSEN.—The jealousy of the chemists at the achievement of the spectroscopists in discovering a new constituent in the atmosphere was perhaps very natural, as it seemed hardly credible that the mere physicist should have accomplished what was supposed to be beyond the reach of the chemists. It was undoubtedly humiliating and galling for the chemists, but they did the only thing possible—they accepted the position yesterday with magnanimity and even generosity. Since chemistry does not hold a monopoly of discovery, and even science is theoretical, supposed to move in a sphere far above petty considerations, the politicians, the chemists should have hailed the discovery by the physicians with open arms. But the revelation convinced them of having jumped at their conclusions and accepted the elemental character of nitrogen on an incomplete induction, and that, too, in a generation in which chemistry claims to have been almost completely reconstructed. It is not surmised that the other conclusions of the chemists should be tested; for if an error lurks in their conceptions of so common a thing as nitrogen, where may other fallacies not lurk!—Liverpool Mercury.

THE BELGIAN POISONING MYSTERY.—The great Belgian trial is over, and Madame Joniaux has been found guilty on all the counts, and condemned to death. A more extraordinary trial has rarely taken place. The sex, age, and social position of the prisoner, and the enormity of the crimes imputed to her, all tend to give it exceptional importance. She has been convicted of poisoning—first, her sister, Mlle. Léonie Ablay; then her uncle, M. Van der Kerckhove, an ex-Senator and a wealthy manufacturer; lastly her brother, M. Alfred Ablay. The brother and sister, according to the theory of the prosecution, were poisoned after she had effected insurances on their lives; the uncle because he expected to inherit his large fortune. There was a dim perspective of other charges of the same sort against her. Her first husband, for instance, was said to have died under very suspicious circumstances.—Daily News.

THE GREAT PHYSIO QUESTION.—The correspondence which is now going on in our columns between the doctors and the druggists must be highly suggestive to the general reader. It is a case of hammer and tongue. It is very curious this venomous hostility between two occupations so closely allied. Yet, when we get at the root of the animosity it is all very plain. Each accuses the other of encouraging on his peculiar domain. The doctor objects to the druggist, or chemist, or pharmacist, as he prefers to be called, diagnosing and prescribing for patients, and he in his turn has like views on the doctor who makes up his own prescriptions. If the public are to believe all that one charges against the other because of this confusion in their respective spheres of duty, the only inference that can be drawn is that they both do a great deal more harm than they do good. Some of the experiences given by the writers of the various letters are enough to make a man forewarn doctors not to be afraid of doctors, and druggists not to be afraid of druggists. The frequent demand of the public for prescribing, so the doctor has to respond to the call made upon him to dispense. It is the public who are to blame for the one branch of medicine encroaching on the other in places where convenience does not require their being combined, and so long as the public do not cry out against the drawbacks and the dangers thereby created, the doctors and the chemists are beating the air in ralling at each other.—Birmingham Daily Mail.

** Laudanum.**—William Bramley, aged 32, died on Friday, January 25, in the Infirmary at Sheffield, from the effects of laudanum self-administered. Verdict: "Suicide whilst of unsound mind."—Sheffield Telegraph.

**Aqua Fortis.**—Robert Jordan Mann, aged 59, died on Tuesday, January 24, in the Tottenham Hospital, from the effects of aqua fortis, self-administered. Verdict: "Suicide whilst temporarily insane."—Middlesex Gazette.

** Brychnine.**—Bertha Atwood, aged 16, died at 338, Monument Road, Birmingham, on Tuesday, January 29, from the effects of rat poison containing brychnine, self-administered. Verdict: "Suicide whilst temporarily insane."—Birmingham Daily Post.

**Laudanum.**—Elizabeth Mayes, aged 60, died at Marham, on Wednesday, January 30, from the effects of an overdose of laudanum, taken to relieve pain. Verdict: "Decayed from misadventure through her having taken an overdose of laudanum to relieve pain."—Norfolk Standard.

**Chloral.**—John Russell Henson, aged 35, died on Saturday, February 2, at the Groveenor Hotel, Manchester, from the effects of chloral, taken to produce sleep. Verdict: "Decayed from an accidental overdose of chloral."—Manchester Evening News.

### Technical Notes.

*From the Technical World.*

According to the *Moniteur Scientifique*, half the aluminium at present manufactured is used in the iron industry. The remainder is largely used in refining nickel and copper. When added to these metals the reduction of the last traces of oxide is completed, the metals become more perfectly fluid, and after cooling can be worked easily. Any aluminium formed in this action is completely insoluble in the nickel or copper, and rises to the top of the bullion itself. The action of aluminium in steel is referred to by the same journal. Rammelsberg found that all the aluminium was used up in deoxidizing, not trace being found in the ingot obtained. At first it was thought that aluminium lowered the melting-point of steel, so that 200° to 300° was gained, but it was found the great fluidity of the steel. Now the ingots are shown to contain no aluminium. The oxide of iron dissolved in steel renders it less fluid and more brittle, and this...
causes it to give off carbon dioxide, hydrogen, and nitrogen.—Technical World.

A French technical paper, the Journal de l'Horloge, declares that a new amalgam has been discovered which is used as a substitute for gold. It consists of 94 parts of copper to 6 parts of antimony. The copper is melted and the antimony is then added. Once the two metals are sufficiently fused together, a little magnesium and carbonite of lime are added to increase the density of the material. The product can be drawn, wrought, and soldered, just like gold, which it almost exactly resembles in being polished. Even when exposed to the action of ammoniacal salts or nitrous vapours it preserves its colour. The cost of making it is about a shilling a pound avoidance.—Daily News.

Fortschritte der Industrie describes an invention of Albert Post, of Halberstadt, Germany, for silvering glass so that it reflects the image when looked at from one side, and when looked at from the other is transparent as ordinary glass. If this be glazed in a dwelling window, for instance, anyone inside can see all that is going on in the street, while anyone looking at the window will see only a mirror light, and nothing inside of it.—Technical World.

Patent Office Business.

Applications for Patents.

[Compiled from the Illustrated Official Journal—Patents."

Where complete Specification accompanies Application, an asterisk is suffixed.

No. 23,918.—Thomas James Randolph Clarkson, 23, Coleman Street, London.—Process and apparatus for sterilising or pasteurising liquids without any contact with the atmospheric air, and for preserving these liquids in sterilised condition and preventing their motion within the vessels in which they are kept. December 7, 1894.

No. 23,914.—Walter Stanley Woodmanay, 23, Coleman Street, London.—A new or improved holder or protector for infants' feeding bottles. December 8, 1894.

No. 23,981.—James Mckewn, 8, Quality Court, Chancery Lane, London.—Improvements in machines for syruping and filling bottles with sterilised liquids. December 10, 1894.

No. 24,046.—James Moore, Joseph Sampson, and Edward Turner Whitelow, 70, Deansgate, Manchester.—Improved substitute for indigo-rubber and improvements in the process of producing the same. December 11, 1894.

No. 24,188.—Peter Watson, 56, Low Street, Keighley.—Improvements in liquid distillers. December 12, 1894.

No. 24,282.—Arcadius Walsh and William Muir, 96, Buchanan Street, Glasgow.—A new and improved substitute for affixing stamps, labels, and the like. December 18, 1894.

No. 24,758.—Charles Denton Abel, 28, Southampton Buildings, Chancery Lane, London.—Method and apparatus for the production of metals and other fusible materials in pulverulent form (Electrokitt-Gesellschaft Gelhausen mit beschränkter Haftung, Germany). December 18, 1894.

No. 24,284.—James Eekdale, 11, Southampton Buildings, Chancery Lane, London.—An improved device for preventing the unauthorised withdrawal of the corks or stoppers of bottles, decanters, and other receptacles. December 18, 1894.

Patent Specifications Published During January.

Erypt of rye (J. F. Johnson, for C. F. Böhrringer und Sohn, Germany).—A new, and valuable, principle of erypt of rye is in the form of a yellow to yellow-green yellow powder, which is soluble in water and insoluble in petroleum, benzene, ethyl alcohol, ether, chloroform, alcohol, and the like liquids; which may be used in medicine and the like industries. December 18, 1894.

Hydrogen peroxide (R. Wolfenstein).—Concentrated hydrogen peroxide is prepared from commercial hydroxyl (6 per cent.) by evaporation, either in the open or under reduced pressure, and then distilling the liquid, which contains about 90 per cent. of peroxide, in vacuo. At 84° C., under a pressure of 69 millimeters of mercury, 99 per cent. of peroxide of 99 per cent. distils over (see Ph. J., Dec. 29, p. 549). "Chemically pure" peroxide may also be prepared from the above-mentioned 90 per cent. solution by pouring it into ether and then adding ether solvent, other solvents combine with water, and separating the substance thus purified from the ether by subsequent addition of water, or the ether may also be evaporated off and the peroxide distilled in vacuo. December 18, 1894.

Bismuth Oxyiodide (Gallatt, F. Lundy).—This compound is described as a greyish-green amorphous substance, insoluble in water and "ordinary solvents," easily soluble in toluene, and slowly decomposed by moist air. It is prepared by digesting freshly precipitated bismuth oxyiodide with gallic acid and water on a water bath or by heating bismuth gallate (dermatol) with hydroiodic acid, and which is said to be good for treating wounds on account of its "antiseptic and drying properties." No. 23,906 of 1894.

Ammonia Soap (H. Heaton).—A "dry soap" is prepared by mixing petroleum or other mineral oil with ordinary dry soap, and then adding a suitable quantity of ammonium hydroxide. No. 23,052 of 1894.

Cellulose and bye-products from wood (C. F. Cross).—Cellulose acetates and oxalates are prepared from wood by treating it with 10 per cent. nitric acid at 85° C., rinsing it to expel the liquid, and then treating with weak alkali. No. 409 of 1894.

Condensed milk (H. E. Hansen).—The casein is precipitated from skimmed milk by acid, treated with dilute alkali, and then evaporated till the previous water is added. The resultant mixture is sealed in tin after heating to 115° to 124° C. for an hour. No. 9,656 of 1894.
Novelties.

[Under this heading it is proposed to publish, from time to time, descriptions of new appliances and chemical and other novelties of interest to pharmacists. In submitting such articles for notice, full particulars should be sent accompanied, if possible, by a block of suitable size for the Journal columns.]

**Universal Bacteria Microscope.**

The idea upon which this instrument is constructed is that of carrying to the utmost extent the advantage secured by having a multiplicity of objectives and eye-pieces ready to hand for instantaneous use. In addition to the revolving nose-piece, carrying three objectives, there is also a revolving adapter for three eye-pieces, nine distinct combinations being thus secured. For certain classes of work this arrangement should prove advantageous, and a saving of much time and trouble be effected. The objectives supplied with the instrument are so adjusted that when once an object is focussed it remains in focus with each of the nine powers. Moreover, by means of the lever behind the micrometer screw, the whole field can be raised or lowered, and the exact focus is restored directly the lever is released. The instrument is supplied complete with three objectives (Nos. 4 and 7, and oil-immersion), and three eye-pieces for the exceedingly low price of ten pounds. An Abbe condenser and its diaphragm are supplied if required at a small additional cost.

**Optimus** Ether Saturator.

The "Optimus" Safety Ether Saturator for optical lantern illumination, heretofore figured, in which ether takes the place of hydrogen, seems to supply a distinct want. When these ether saturators were first introduced they got rather a bad reputation, on account of the chances of explosion which they presented, but all danger seems here to be avoided. In this apparatus no heat is necessary to vaporise the ether, nor is there any chance of accumulation of mixed vapour, the gas passing through a narrow canal which is filled with some absorbent material, and being delivered direct to the burner. The pure oxygen tube is entirely distinct from the rest of the apparatus, hence there is no danger from leakage. Complete isolation of the mixed vapour chamber from the burner is effected not only by the ordinary jet taps, but also by one to control the inlet of oxygen and another the outlet of mixed gas. The Saturator is made by Messrs. Perkin, Son, and Rayment, of 99, Hatton Garden.

**Climax** Thermometers.

The principle adopted by Mr. James J. Hicks, 8, 9, and 10, Hatton Garden, E.C., in the manufacture of the "Climax" Clinical and Chemical Thermometer is a decided improvement. The divisions and figures, instead of being cut on the glass are placed on a separate transparent scale, which is inserted in the body of the thermometer. By this means the readings are always clear and distinct, and the possible accumulation of infectious matter when using the clinical thermometer is avoided. The application of this idea to chemical thermometers does away with the annoyance caused by the black markings on the outer surface of the glass being liable to ensure at high temperatures. The Chemical "Climax" Thermometer can be had graduated on either the Centigrade or Fahrenheit scale.

**The "Climax"**

**The Enema Race.**

This simple and ingenious device has been suggested by the almost universal adoption of India-rubber enema syringes by the medical profession and the public, which makes an improved method of storage a matter of considerable importance. It is introduced by Messrs. Reynolds and Branson, of Leed's, who point out that if syringes are folded and shut up in their boxes, they will suffer more from the tubes remaining bent than from any wear when in use. The Enemas are supplied in the only position in which they should be stored, i.e., as represented in the illustration, and provides that proper place for them which is consistent with forethought and good order. The small phial saves any mess from drip, whilst the Backet is made of tinned wire and, being hinged in the middle, folds up for portability. The cost (9d. each) is so small that it is saved in the longer preservation of the Enemas. The agents to the trade in London are Messrs. Hatrick and Co., Snow Hill, E.C.

**Optimus" Hand Camera.**

A very popular film camera is the one known as the "Optimus", 94, which is also, as the name indicates, made by Perkin, Son, and Rayment, 99, Hatton Garden, E.C. This carries 36 films on celluloid, which are the same as used by all manufacturers, hence no preparation of films before recharging, is required. The use of aluminium has been adopted to a considerable extent for mounting the "Optimus" camera, and whilst the weight is of course much lessened, means have been taken to prevent the stability being lessened.
Diary of the Week.

[Notices for insertion under this heading should reach the Editor on or before Wednesday.]

SUNDAY, FEBRUARY 10.
Sunday Lecture Society, at 4 p.m.
"Deep Sea Explorations in their Geological Bearings" (Illustrated), by Dr. D. Roberts.

MONDAY, FEBRUARY 11.
Imperial Institute.
House Dinner at 6.45 p.m.
"Across Iceland on Horseback" (Illustrated), by Mr. W. T. McCormick at 8.30 p.m.

London Institution, at 5 p.m.
"Truth and Falseness as to Electric Currents in the Body," by Professor Victor Horsley.

Society of Arts, at 4 p.m.

Royal Photographic Society, at 8 p.m.
Annual General Meeting.

Royal Geographical Society, at 8.30 p.m.

Papers to be read:

TUESDAY, FEBRUARY 12.
Royal Institution of Great Britain, at 8 p.m.
"The Internal Framework of Plants and Animals" (Fifth Lecture), by Professor Charles Stewart.

Royal Society, at 8 p.m.

WEDNESDAY, FEBRUARY 13.
Pharmaceutical Society of Great Britain.
Library, Museum, School and House Committee Meeting at 5 p.m.

Junior Pharmacy Ball
Dancing at 9 p.m. at the Portman Rooms.

Imperial Institute.
Concert Dinner at 6.30 p.m.
Smoking Concert at 8.30 p.m.
Concert at 10.15 p.m.

University College (London) Chemical and Physical Society at 5 p.m.
Annual General Meeting.

Society of Arts at 8 p.m.
"Light Railways," by W. M. Aesworth.

Sheffield Pharmaceutical and Chemical Society at 8.30 p.m.
Students' Night.

Manchester Pharmaceutical Association, at 7.30 p.m.
Discussion on the "Pharmacists' Education," opened by W. Kirby.

THURSDAY, FEBRUARY 14.
Royal Institution of Great Britain, at 5 p.m.
"Meteorite," by L. Fletcher.

Society of Arts (Indian Section), at 4.30 p.m.
"Village Communities in Southern India," by C. Krishna Mookerji, at the Imperial Institute.

London Institution, at 6 p.m.
"Glass, Antique and Artistic" (Illustrated), by C. F. Binns.

School of Pharmacy Students' Association, at 7 p.m.
"Photography as a Hobby for Chemists," by G. S. Durrant.
"Chemistry in Relation to Agriculture," by S. Batsow.
Chemists' Assistants' Association, at 8.30 p.m.

Midland Pharmaceutical Association at 8.30 p.m.
"Laboratory Notes," by J. Barclay.

FRIDAY, FEBRUARY 15.
Pharmaceutical Society of Great Britain.
Evening Meeting in Edinburgh, at 8.30 p.m.
Royal Institution of Great Britain, at 9 p.m.
"Mountaineering," by Clinton T. Dent.

Geological Society of London.
Annual General Meeting, at 8 p.m.

Annual Dinner at 7.30 p.m.
Quinet Microscopical Club, at 8 p.m.
Annual General Meeting.

SATURDAY, FEBRUARY 16.
Royal Institution of Great Britain, at 3 p.m.
"English Country Songs" (with musical illustrations), by Sir A. C. Mackenzie.

Obituary.

We regret to announce the death from pneumoconjunctivitis and pleurisy, at his home in the Royal Infirmary, Edinburgh, on the 2nd inst., of Charles Arthur Chemist to the Institution and an Associate of the Pharmaceutical Society. Mr. Arthur served his apprenticeship with the late Mr. Gavin Steel, Dunfermline, and came to Edinburgh about twenty-four years ago, when he entered the service of Messrs. Sang and Barker. He was afterwards with Messrs. John Mackay and Co., Edinburgh, then with Messrs. Rankin and Borland, Kilmarnock, subsequently returning to Edinburgh, where he entered the employment of Messrs. James Robertson and Co. In 1882 he was appointed Chief Dispenser to the Royal Infirmary, Edinburgh, and held that office until his death. Under his supervision great improvements have been made in the Dispensing Department of the Royal Infirmary, and very recently extensive alterations and additions have been carried out to admit of aerated waters and various galleon preparations being manufactured on a large scale in the Institution. He had an extensive experience, and was well known as an accomplished practical pharmacist, his assistance and advice having been frequently publicly acknowledged by members of the Infirmary Medical Staff. He contributed useful practical papers on several occasions to evening meetings of the Society in Edinburgh. In 1892 Mr. Arthur compiled a Pharmacopoeia of the Royal Infirmary of Edinburgh, which contained many recipes devised by him at the request of the Medical Staff. He leaves a widow, but no family. He was at the Chemists' Ball on 24th ult., and even on Monday week last was apparently in good health and spirits.

Notice has been received of the death of the following:

On January 13, Thomas Pearce, Chemist and Druggist, Gloucester. (Aged 87).
On January 20, Thomas Oates, Chemist and Druggist, South Shields. (Aged 64).

Trade Marks Applied For.

[Compiled from the Trade Marks Journal.]

182,188. - [BEBAUDINE, and device in circle. Preparation of pastes for veterinary dressing, and for sanitary purposes.—The Peat Industries Syndicate, Limited, 82, Queen Victoria Street, London. November 15, 1894. The essential particular is the device.]

182,981. - [Device of an oblong circle-engraved label, bearing fac-simile signature of the applicant. Chemical substances used for agricultural, horticultural, veterinary, and sanitary purposes.—Thomas Tyer and Co., Stirling Chemical Works, Abbey Lane, Stratford, London. October 12, 1894. The essential particular is the combination of devices and the fac-simile signature.]

182,189. - [BEBAUDINE, and device in circle. Medicinal preparations of pastes for human use.—The Peat Industries Syndicate, Limited, 82, Queen Victoria Street, London. November 15, 1894. The essential particular is the device.]

[The quotations here given are in all cases the lowest net cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the pharmacist. It is important that this should be borne in mind, as there may be some variation between these prices and those of the wholesale drug trade.]

THURSDAY, FEBRUARY 7, 1894.

There have been but few changes in the chemical market, since our last issue, prices for most part remaining unaltered. The amount of business done has been very small, and variations have been mostly on the down line. Both citric and tartaric acids remain unchanged at last week's prices, but are in poor demand. Some samples of compounds are rather easier, the small reduction in sulphate being in company with a fractional one in carbonate, whilst sal ammoniac remains unchanged. Arsenic is quiet at the ordinary rates. Acid in most cases has occurred in cream of tartar, which is very easy at reduced quotations. Mercurials are unchanged, and this applies as well to borax, bleshooting powder, and sulphate of copper. Of being more than equal to the entries for last week, it is variable. After touching 10d. last week, it gradually declined until it is fractionally less than last week's closing price. The remaining compounds are steady at last week's rates. Quicksilver is slightly easier. Quinine is steady at a fractional advance, whilst the previous quotations still hold good for soda compounds. Details—

ACID, BORIC.—Quotations are: Crystal, 35s.; powder, 32s.

ACID, CITRIC.—The market is dull at unchanged prices. Still, price is from 1s. 1kd. to 1s. 2d.

ACID, OXALIC.—In fair demand at unchanged rates. Manufacturers quote at 5d. ex railes.

ACID, TARTRIC.—Although last week's prices are maintained, it can only be taken as indicating that a further decline is unlikely, as the limit would appear to have been reached. Returns:—Engl. 10d. to 11d. Foreign, crystals, 10d.; powder, 10d.

AMMONIA SULPHATE.—The market is very quiet, prices being equal to the entries for last week, which were 1d. 6d. to 1d. 10d. in open market quotations. Present quotations: Grey, 2d. per cent. £1 11s. 6d. Carbonate: Here prices are fractionally reduced, in sympathy with those of sulphate. It is now quoted at 5d. 6d. Sal Ammoniac: In steady demand at 50s. for first, and 77s. for second quality.

ASHER.—Unaltered. Returns still place American at 40s., with pots at 23s.

ASBENC—Unchanged. The market is rather quiet still, as the supply is not large, and the quotation, 1s. 9d. to 1s. 10d., remains unaltered.

BLEACHING POWDER.—A quiet but steady market, quotations remaining unchanged at 1s. 6d. to 2s. 6d.

BORAX.—The demand continues steady, but the price is unaltered. Crystals are returned at 20s., powder at 21s.

COPPER SULPHATE.—Last week's steady demand has been continued, without however, causing a rise in prices. At 1s. 10d. to 1s. 15d., the second quotation being returned for special brands.

CREAM OF TARTAR.—The brisk demand which was noted last week has now been maintained, the supplies being more than equal to the entries for last week, and crystals are now worth 60s., whilst 60s. is quoted for powder, in which a depreciation of 1s. 6d. to 2s. is noticeable.

FERMENTIC.—There have been no alterations in the prices here. In quantities up to 28 lbs., cabinet is offered at 2s. 9d.; red precipitate, 3s.; white, 5s.; corrosive sublimate, 2s. 6d.

FOSFORIC COMPOUNDS.—With one exception prices are steady. Phosphoric acid is 2s. 9d. per lb.; the remainder is 2s. 10d. per lb.; this is at 2s. 6d. per lb.; the latter is of good quality. The last quotation for this is 2s. 3d. per lb.; the remainder is 2s. 6d. per lb.; the latter is of good quality.

QUICKSILVER.—It is quiet at a somewhat lessened quotation, but the reduction is not very material. In first hands the price is returned as 2s. 10d.; in second hands it is offered at 2s. 9d. 6d. to 2s. 10d.

QUININE SULPHATE.—Although the amount of business done in the best German makes is not of any great amount, still the tone of the market is considerably improved, and quotations are fractionally higher, now reading 11d. per oz. for B. 8. 9. and Brunswick in second hands.

SODA COMPONDS.—Steady, at unchanged quotations. Caustic is still worth 2s. to 2s. 9d. for 70 per cent. whit. 60 per cent, being quoted at 2s. less. Crystals unaltered at 3s. Bicarbonate also remains at 2s. 7d. (London).

THURSDAY'S DRUG SALES.

The usual fortnightly sales were held on Thursday. The amount of drugs offered was above the average, but business proved slack, a large proportion being bought in. There were no marked changes in prices, this, however, affording but little indication as to the tone of the market. Details are given below:—

ACACIA.—Only a small amount was offered at the sale, the majority of which was bought in, the reserve in few cases being reached.

ACONITE BORO.—Three bales of ordinary root were returned, and 60 bags of the Japanese variety, but there were few enquiries as for it.

ESCARAS WATER.—Twenty cases were offered, containing fifty pint and twenty-five quart bottles, respectively, but were bought in, a solitary bid of 6s. being rejected.

ALCOHOL.—Carambura and balsam of the 30th April was bought in at 45s. to 55s. Bittern boxes fetched 40s. to 55s. Another carat of 200 guards was bought in at 45s., after a bid of 28s. had been rejected. Five kegs of Soochee- trine sold at 7s. 3d.

AMBRE.—Only a small amount was offered, the majority of which was withdrawn.

ARICA NUTS.—Thirty-one bags were offered, all of which was withdrawn.

BARZONI'S GRASS.—Two cases of Siamese gum sold without reserve; fetched 47s. A large proportion, however, was bought in, prices ranging from 75s. upwards.

BUCTH.—A moderate amount was offered of the long and short variety. A bale of long buchu was bought in at 7d.

CANNABIS INDICA.—All bought in at 3d. to 3d.

CANTHARIDES.—Eight cases were bought in at 1s.

CARDAMOM.—A large amount offered and bought in demand. The best Indian white was worth 3s. 6d. 1d.; medium, 2s. 6d. 4d.; small, 1s. 6d. to 2s.; poor shrivelled, 1s. 5d.

CASCARA.—Two hundred and fourteen bales were offered. Of these 198 bales were bought in at 28s. The remainder, consisting of small bark, somewhat broken, was sold to a bid of 30s.

CHIRETTA.—Twenty-four bales offered, which were all disposed of at 14s. to 16s.

CINCHONA.—Four serons gray quill bark sold at 7s. 4d. to 10d. A parcel of forty-eight serons crown bark were all bought in at £6. 6d. to 1s. 2d. Of a parcel of 175 packages yellow bark, mostly damaged, the majority was bought in at prices varying from 3d. 4d. to 10d.

COCA LEAVES.—Fourteen bales were all bought in at 1s. to 1s. 3d.

COPIA.—There is but a poor supply. Good quality mannanium is worth 1s. 6d. to 1s. 7d. Balsa : Dark to fair, 1s. to 1s. 4d.

CORIANDER.—Of a parcel of 76 bags offered, all were bought in at 1s. 6d. to 1s. 7d. Twenty-five bales of East Indian were also withdrawn at 10s. 6d.

CROTON.—Ten bales were all disposed of at 2s. 7d. to 2s. 9d. A parcel of forty-eight serons crown bark were all bought in at £6. 6d. to 1s. 2d. Of a parcel of 175 packages yellow bark, mostly damaged, the majority was bought in at prices varying from 3d. 4d. to 10d.

DRAGON'S BLOOD.—Twenty-four cases offered. Of these nine cases were sold at £2 10s., one block at £2 15s. 6d. The majority of the rest was bought in at £1 10s.

EROT.—9 bags, sold without reserve at 7d. to 8d. The majority of that offer was bought in at 10d. to 11d.

EUPIPHIUM.—Not asked for at all; 14 serons were bought in at 21s. 6d. to 25s.

GAMBAG.—Three cases were bought in at £10, and another consignment at £10 10s., with pickings at 2s 6d., no bid being forthcoming.

GUAIACUM.—All bought in, best quality at 1s. to 1s. 2d.; seconds, 6d.
Photographic Notes.*

Mounting Difficulties.

A few days ago I stepped into an amateur's workroom, and found him sweating over mounting difficulties. The mount laid on the table, carefully pencilled, marked to indicate where the print should come, and my friend was busy at work applying glue to the edges of the print, "so that it would stay where it was placed." Now, there are several reasons why this is a bad procedure. Glue is hard to spread, and sets very quickly, but it also often contains substances injurious to the print, to say nothing of the fact that it soon decomposes and degrades the print. As a mountant, nothing that I know of is better than thick starch for albumen prints, and starch and fine flour for aristos. I make up a starch by mixing and stirring it carefully, then add a little water and stirring the starch may be left in it. A few drops of all of cloves will preserve it for a week. I always strain the starch through a salt bag, and it should be thick enough to require considerable presssure to force it through. Now the prints are drawn out of the last wash water on to a large piece of glass, and allowed to drain for a few moments. Then take a towel and roll it up compactly, and roll it over my prints, forcing the moisture out, which is absorbed by the towel. This provides a backing which is flexible that it enters every indenture of the uneven pile of prints. It also dries the prints so that they readily take the paste. My paste brush has the bristles set in hard rubber, which holds them securely. The mountant must be thoroughly rubbed into the pores of the paper. Now comes the rub of placing them on the mount. If it is a cabinet, you soon acclimate yourself to place them just so far from the sides and top, and you mount so near the edge that little difficulty is experienced. In case of plain mounts, 10 x 12 or larger, greater care is needed, as, for the best effects, you must have plenty of margin around your prints. I will mention two methods. Instead of a glass plate place your print on oiled cloth to receive the paste. This can be readily washed off and rolled up, and laid away when not in use. Now out a piece of stiff brown paper the size of the mounts to be used, and draw on it in pencil mark an outline the exact size of the print, and just where you want it on the mount. Now lay the print, face down, on the brown paper inside this outline. The pasted side is up. Stand the mount exactly on the upper edge of the paper, and glau you lower it, and gently press over the print. Now lift up your mount, and the print is in place. But the better way is to train the eye to the exact measurement of distance. Take up your pasted print and hold it in both hands, being careful not touch the corners nor the edges. Hold it before you over the mount, about an inch from its surface, note carefully, is the proper distance from the upper edge, is it correct with the upper edge, is it equal distance from the two outer edges? If so, gently lower. Should you find a slight mistake, slip the print into place without delay. In the final rubbing down I use a brown, bireous paper, which can be used over and over again, and does not wrinkle nor curl up. That's all there is of it. Above all, let me say to the amateur, train your eye, with the hand, with the brain, it should become more and more a thing of yourself. A trained eye, a trained hand, and brain and soul even, for I believe that is where the feeling of art resides. Your photography will bless you in proportion as it makes you more perfect.—J. H. Bates.

Exchange.

OFFERED.

BOOKS.—"Edinburgh Dispensatory," 1810; "London Dispensatory," 1868; "Cooper's Dictionary," 1818; "Pelgar's Herbal," coloured plates (soiled); "Milton's Spurnetorrorre," 3s. 6d. each (postage extra); Twelve yards corrugated paper. 2s.—Chalmers, Clifton Dispensary, Bristol.

RECIPTS, 130 well-tried, general, remedial, veterinary, toilet, and everyday preparations, neatly copied in book. Post free, 1s. 6d., or exchange patents or books.—Tully, chemist, Hastings.

MATERIA MEDICA CABINET (Evans, Leecher and Wills), 1846, give a new cost. 23s. 2s., take 21s. 2d.—Wood, 161, West ern Terrace, Hyde Park, W.

UNDERWOOD'S SPHINX HAND CAMERA, cost 23s. 15s., fitted with all latest improvements; sell 23s. 10s., or part exchange the same in books suitable for "Minor."—Louis Wels, Armley, Leeds.

WANTED.

BOTANICAL INSTRUMENTS AND APPARATUS, also good microscopcs.—Radix, Louth, Lines.

FOOT-STOPPING INSTRUMENTS.—Modern, by good maker. Cheap.—Approval to W. Hindle, Obemis, Gorleston, Great Yarmouth.
Notes.

THE LATE S. M. BURROUGHS.—At a meeting of the Council of the British and Foreign Arbitration Association held on February 8, the following resolution was adopted:—"The Council of this Association desires to record its sincere regret at the premature death in the prime of his usefulness of Mr. S. M. Burroughs (of the firm of Messrs. Burroughs and Wellcome), whose interest in, and increasing devotion to, the cause of international arbitration and peace for many years, and in many directions, merits from this and other kindred associations a cordial recognition." Mr. Henry S. Wellcome desires, on behalf of himself and the employees of his firm, to express to the trade generally their warmest thanks for the numerous letters of sympathy received on the occasion of Mr. Burroughs' decease.

PRACTICAL MANUAL ON PHARMACY AND OTHER ACTS.—Mr. F. J. Reboz, 11, Adam Street, Strand, announces the publication of a book on 'The Law and Chemistry of Food and Drugs,' by H. Mansfield Robinson, LL.D. (Lond.), Solicitor and Clerk to the Shorehoto Sanitary Authority, etc., and Cecil H. Orb, B.Sc. (Lond.), F.I.C., Public Analyst to the Strand District Board of Works, etc. The work is described as a practical manual on the Sale of Food and Drugs Acts, 1875 and 1879; the Margarine Act, 1887; the Pharmacy Acts, 1852 and 1868; the Bread Act, 1836; the Fertilizers and Feeding Stuffs Act, 1893; the Inland Revenue Acts, and other Statutes relating to Adulteration. It will also treat of so much of the Public Health Acts as relate to unsound food. All recent decisions on the Acts will be dealt with, and practical hints will be given to traders and inspectors as to the execution of the Acts, with so much of the chemistry of articles of food and drugs as is requisite in conducting or defending prosecutions. Crown 8vo. 6s. About 400 pp.

PERSONATION CASE AT GLASGOW.—In the report of the decision in this case (see p. 47) it will be noted that the Sheriff commented on what he characterised as "the mistaken and unfair policy of the officials of the Pharmaceutical Society" in withholding certain "facilities." The only matters which the Society's officials were asked to produce were the examination papers supposed to be written by Conner, and the visitors' book from York Place. The former had been destroyed long ago, and information was given to that effect, whilst Mr. Rutherford Hill was present in court with the visitors' book. It is difficult, therefore, to understand what Sheriff Henderson Begg could have referred to.

THE OXFORD BOTANIC GARDEN.—The income, by which hitherto the Botanic Garden at Oxford has been maintained by the curators from endowments, has recently fallen off, owing to agricultural depression; and it is proposed that the deficit shall be made up out of the university chest.

PHARMACOPOENIA COMMITTEE IN EDINBURGH.—Dr. W. Inglis Clark has been asked by the College of Physicians, Edinburgh, to join Professor Fraser and Dr. Ralph Stockman in constituting a Committee on the proposed revision of the British Pharmacopoeia.

DIPHTHERIA ANTITOXIN.—Messrs. Allen and Hanburys (Limited), London, have been appointed special agents for the supply of diptheria antitoxin prepared by the British Institute of Preventive Medicine. They also manufacture a syringe for injecting the serum, which has been approved by Dr. Ruffer, Director of the Institute.

UNIVERSITY OF LONDON.—In the House of Commons on Tuesday, Mr. Acland informed Sir A. Rollit that the Government proposed shortly to introduce the Bill with reference to the University of London in the House of Lords.

COD LIVER OIL AND CHEMISTRY.—This is the title of a handsome work by Dr. F. Peckol Muller, who has endeavoured to bring before pharmacists and medical men the main facts concerning cod liver oil. It is shown how the fats of this oil differ from other fats, and light is thrown on the pharmacological action and therapeutic possibilities of the former. The pharmacy of cod liver oil is also treated of, and a summary given of the literature of the subject, besides descriptive sketches of the places where it is made, the people who make it, the methods of manufacture, etc., etc.

LONDON MEDICAL DIRECTORY.—The volume for the current year is the seventh issue of this useful work. It contains twenty-four pages more than last year, the increase in bulk being due, as formerly, to the constant addition of fresh societies, publications, and institutions, as well as to greater accuracy of detail in the information given. As an efficient and useful guide and handbook, therefore, the Directory ought to be in greater demand than ever.

PHARMACEUTICAL SOCIETY OF IRELAND.—In the new Calendar of this Society, corrected up to December 31, 1894, the number of Irish Pharmaceutical Chemists is given as 466, members of the Society 188, Chemists and Druggists 309, Registered Druggists 851, Associated Druggists 125.

NAVAL DISPENSERIES.—On Tuesday last Lord Spencer received a deputation of Irish members of Parliament on the subject of the appointment of pharmacists by the naval authorities. It was complained that the authorities refuse to recognise the certificate or licence of the Irish Pharmaceutical Society, and the First Lord of the Admiralty undertook to endeavour to bring about the rescinding of the Order in Council regulating the matter, in favour of one which would meet the wishes of the deputation.

THE METRIC SYSTEM.—On the motion of Sir A. Rollit, a Select Committee was appointed by the House of Commons, on Wednesday, to inquire whether any and what changes in the present system of weights and measures should be adopted.
Miscellaneous News.

FUNERAL OF MRS. S. M. BURROUGHS.—The funeral of the late S. M. Burroughs took place at Mossel Cottage, Dartford, on the 8th inst. A funeral memorial service was held the same afternoon at the parish church, Dartford, and was attended by Mr. H. S. Welcombe, the partner of the deceased gentlemen, and by Mr. Sudloe, Mr. Kirby, and the various members of the staff from Snow Hill Buildings and the Chemist's shop. The service was conducted by the clergy, and the congregation included many well-known members of the trade and personal friends who were anxious to render a last tribute of esteem and respect to the memory of this widely-known and popular man, who, on account of his many sterling qualities, will not easily be forgotten. The Vice-president, in his course of an eloquent address, alluded to the Dartford Cottage Hospital, which owes its existence to Mr. Burroughs' philanthropy, and to which he had contributed another large donation a short time before his death.

THE LATE S. M. BURROUGHS.—A meeting was held at the Cannon Street Hotel, on Tuesday, the 12th inst., to consider the question of raising a memorial to the late Mr. Burroughs. There was a large and representative attendance of those interested in the subject, including, besides several prominent phar-macists, members of the medical and literary professions. Mr. Michael Carteighe was voted to the chair, and in the course of a few sympathetic remarks explained the object of the meeting. He called upon Mr. H. Habling to read the preliminary list of subscribers and state his views in respect to a suitable form for the memorial to take. Mr. Habling announced that over £200 had been already promised, and he did not doubt that £1000 or even £2000 could be subscribed. Having in mind how Mr. Burroughs sympathized with the side of pharmaceutical education, he was of opinion that the most appropriate form of memorial would be the endowment of a scholarship to be called the "Burroughs Memorial Scholarship" on the lines of the Jacob Bell Memorial Scholarships.

Mr. A. G. Wootten, who followed, made a suggestion to the effect that if the interest arising from the sum were distributed each year amongst the five oldest annuitants of the Pharmaceutical Society's Benevolent Fund, it would be perpetuating the deceased's memory in a manner most in accordance with his charitable instincts.

Mr. Radford thought it would be best to defer for the present any final decision as to the form which the memorial should take. For the present the main point was to get as many subscriptions as possible, it would then be time enough to determine the use it should be put to.

Messrs. T. MacEwan and H. W. Lidia, L.C.C., were also in favour of leaving over for the present the manner in which the fund raised was to be employed. In the course of a lengthy discussion, in which Messrs. J. Moss, Frank Smith, Wallace, Fletcher, Gerrard, Somerville, and Drs. Pasmore and Gubert took part, abundant evidence was afforded of the esteem and affection in which Bouroughs was held by all who came in contact with him, and it was finally decided to appoint an Executive Committee, with all those present at the meeting as a general committee. The Executive Committee was appointed as follows: Messrs. Carteighe, Frank Smith, L.C.C., Radford, Wallace, Fletcher, Gerrard, Somerville, Pasmore, and Gubert. Subscriptions may be sent to the Treasurer, 39, Tree-stillian Road, S.E.

Letters and telegrams of apology and sympathy were read from Messrs. T. P. O'Connor, M.P., Welcombe, and Richards. In the course of the discussion it transpired that the employés at Messrs. Burroughs, Welcombe and Company were themselves raising a similar object. The general meeting was concluded by a vote of thanks to Mr. Carteighe.

CHEMIST AND DRUGGIST SOCIETY OF IRELAND.—The committee meeting of this Society was held on Feb. 4, eleven members being in the office, North St., Belfast. Mr. John H. Shaw in the chair, and subsequently Sir James H. Haulet, J.F., President. Present also: John Campbell, Jacob Walsh, A. R. Hogg, John Cairns, S. Gibson (hon. treasurer), and W. J. Ransink (hon. secretary). The minutes of the previous evening were read and adopted. Mr. Gibson reported that nineteen members had sent their subscriptions since previous meeting, and submitted a list of members and other druggists not connected with the Society. After consideration of same it was resolved to divide the list into districts, and the Committee to consider the various plans to endeavour to enlist their co-operation. The President reported having received a letter from Mr. Turkington Cookstown (one of the vice-presidents of the Society, who is also a member of the Pharmaceutical Council). The writer asked their views on the question of limited companies dispensing prescriptions, as the question was to come before the Council at their meeting to-morrow (Wednesday). Mr. Gibson reported that he hoped to attend the meeting on Wednesday also. The President fully explained the points at issue; and after considerable discussion Mr. Gibson was asked to represent their views, and endeavour to have a deputation of the Pharmaceutical Council and members of their Committee to discuss this question and offer their assistance to both bodies. The President intimated he was glad to see the members taking an interest in these matters, and thanked them for their attendance, after which the Committee adjourned—Northern Whig.

ALLOWED ILLEGAL SALE OF PRUSIFIC ACID.—At the recent Chesterfield County Petty Sessions, Thomas Harold Bradley, chemist, was charged with unlawfully selling at Whittington Moor, on January 18, to Albert Wallace Bellifit, grocer's assistant, prussic acid, the said Albert Wallace Bellifit being a person unknown to him, and not being introduced by any person known to him.—Mr. Walker, the prosecutor, appeared for the defendant.—Daisy Lowndes, a girl 18 years of age, living at Whittington, said she was in the shop when Bellifit was in. She signed her name in the poison book, and the signature produced was hers. She was asked by Mr. Bradley to sign her name, and Bellifit was there at the time buying the poison, which he said was for a dog. She had never seen Bellifit before. She could have read what was over her signature, but did not. She had known Mr. Bradley some time, and he would know her name. She heard part of the conversation in the shop. She did not tell Mr. Bradley whether she knew Bellifit or not.—The Magistrate's Clerk (Mr. Humble): I don't think you will cross-examine her on that; the Act says "known to the seller."—Witness, continuing, said she lived within three minutes' walk of Bellifit's house. James Dunn said he went into the shop while Bellifit was there. Bellifit asked for some poison to destroy a dog with, Mr. Bradley objected, saying they did not have it. He went inside to get in the presence; indeed they preferred in all cases to administer

* This name does not appear on the Register of Chemists and Druggists for 1895.
it themselves. Mr. Bradley asked him if he knew Mr. Walker, and he replied, 'Do you mean Lawyer Walker?" and when Mr. Bradley said, "No, his father?" Bellist said he did. Mr. Bradley then said Mr. Walker would be coming down the following day and Bellist must come down then and bring the dog. Bellist said it was a long way to come again, and threw down a shilling on the counter, remarking, "I'm afraid of you having this poison don't think I want to take it myself, as I am too fond of having a drop of boozc."—Mr. Walker rose to cross-examine the witness, but the Chairman of the Bench (Mr. E. W. Barnes) said he did not think he need cross-examine the witness as the Bench were of opinion there was no case under the Act. They wished also to say the police had done perfectly right in bringing the case into court, as cases of that kind required to be very carefully dealt with.—Derbyshire Courier.

LUMINOUS PLANTS IN ABERDEENSHIRE.—A correspondent of Science Gossip remarks that it is of value to notice that the sulphur-coloured trefoil (Trifolium ochroleucum), has acclimatised itself in Mony-musk, in the Don Valley, which has evidently been the result of being introduced among agricultural seeds. When I saw plants of it there several years ago, I very much doubted if they would live in the moist soil, and had evidently thoroughly established themselves. While hop trefoil (Trifolium procerum) at one time only occurred at the outside of its limits, when its seeds were introduced among agricultural seeds, it is now supporting itself in some parts by the seeds of the local-grown plants, producing plants, being an advance from the time when the seeds did not mature sufficiently to germinate or at least strong enough to produce plants. The common vetch (Vicia sativa), which has always been occasionally met with here on agricultural fields, has of recent years established itself in manner similar to the last-mentioned, along various tracts of the Valley of the Don, where its attractive flowers adorn the landscape among the other flowering plants. He has been unable to find large birds-foot trefoil (Lotus major, Soop.), in Alford, where it was once found, although he has seen it in Midmar, nearer the sea coast, growing on damp peat and not be afraid of mould. This plant has not been so abundant here for some years as it once was, but perhaps the increase of any particular class of animals might cause this for some seasons, which might just revert to the former quantity during the next few years, or there might be a permanent decrease.

PRACTICAL CHEMISTRY SYNOPSIS OF THE CONJOINT EXAMINING BOARD.—The Examining Board in England of the Royal College of Physicians of London and the Royal College of Surgeons of England gives notice that the following revised synopses of the Examination in Practical Chemistry will come into force and will apply to all Candidates on and after October, 1894:—

Identification of substances included in the following lists:

INORGANIC.

Metals.—Sodium, potassium, ammonium, calcium, barium, magnesium, molybdenum, iron, aluminium, copper, silver, lead, mercury, bismuth, antimony, arsenic.

Acids.—Hydrochloric, hydrobromic, hydriodic, nitric, carbonic, sulphuric, phosphoric.

The metals may be present as metal, oxide, sulphide, or as a simple salt. The acids hydrochloric, nitric, sulphuric may be present in the free state.

ORGANIC.

Acetic, oxalic, tartaric and hydrocyanic acids, and their salts with potassium, sodium, and ammonium. Cane and grape sugars. Urea.

Candidates will be required to give equations illustrating the chemical reactions involved in testing for the above substances, and, if requested, to explain the same.

Preparation of one of the following compounds:—

Chloride of sodium, of ammonium, or of lead.

Oxide of lead or of mercury.

Hydroxide of sodium or of copper.

Carbonate of sodium, of calcium, of magnesium, or of bismuth.

Oxalate of ammonium.

Oxalate of uric.

Nitrate of potassium, of barium, or of lead.

Phosphate of calcium or of iron.

Sulphate of sodium, of calcium, of magnesium, of zinc, or of copper.

Candidates will be required to exhibit to the Examiners the preparations which they have made, and to represent by equations the reactions involved.

PROTYLIC PHARMACY.—Mr. J. J. Brown, chemist and druggist, Glasgow, writes stating that "the feeling is abroad amongst philosophic scientists that all the chemical elements, the luminiferous ether, etc., are but different densities of a universal substance. That is, that substance (or protyle, as Crookes calls it) is diluted in space into different densities, which different densities are the elements. That, then being so, essential substance must be that which is conscious, for there is nothing else to be conscious." To this communication he appended a printed card as follows:—

POISON.

IN LARGE DOSES.

THE ETERNAL NEWS.

Edition for (1st January, 1901) the 80th Century NOW READY.

Highly Recommended by Dr. ALFRED RUSSELL WALLACE
LL.D., F.R.S., etc., the Father of Darwinism, and One of the Foremost Scientists of the Age.

"THE ETERNAL NEWS" PROVES THAT SUBSTANCE IS ACTUALLY CONSCIOUS AND IS THEREFORE SPIRIT; AND THAT SUBSTANCE EXISTS IN SPACE AND MOVES IN SPACE; AND THAT THE VARIOUS FORMS IN NATURE, SUCH AS STARS, CLOUDS, HILLS, STONES, WOOD, ANGLES, etc., ARE BUT MORE DENSE SHAPES INTO WHICH THE EVERLASTING, CONSCIOUS SUBSTANCE THROWS ITSELF. "THE ETERNAL NEWS" is sent forth to you in simple words (as complex words give opportunity for mental juggling) that BEING actually is; that outside TIME, SPACE, SUBSTANCE, MOVEMENT, AND SHAPES (which is the central theme) THAT WHICH IS CONSCIOUS: THAT AT WILL SUBSTANCE moves itself and creates MOVEMENT; and that AT WILL SUBSTANCE holds together, moves, and creates, various SHAPES, which SHAPES constitute the creation. And the argument is that BEING or EXISTENCE is unalterable otherwise.

"THE ETERNAL NEWS" IS TO BE HAD BY POST, for 12 pence per copy, from the author, J. J. BROWN, 300, Cathcart Road, Glasgow, Scotland.

PLEASE PRESENT THIS POST CARD FOR FURTHER CONSIDERATION, the hand is on to your Scientific and Philosophical Neighbours.

J. J. B. C.

CASE OF ALLEGED PERSÖONATION.—At Greenock Sheriff Court on February 6, Sheriff Henderson gave decision in an action in which John Conner, his assistant, 39, Bank Street, Greenock, sued Dr. William Cumins, Greenock, for £500 damages as slander. Pursuer stated in his condescension that he was 28 years of age, and was assistant in the shop at 38, East Hamilton Street, belonging to Dr. Lawrie.
where messages were received for defender, who had also the use of a room in said shop for consultation. Defender had accused him of having got a young man, named Frank Lambie, to personate him and sit for him at his Preliminary examination of the Pharmaceutical Society at Edinburgh in January, 1892. Pursuer maintained that he passed the examination in question, and that his employer had threatened to dismiss him unless the matter was satisfactorily cleared up, he had brought the action for the purpose of vindicating his character. Defender pleaded veritas. His lordship heard evidence at great length a few days ago, and yesterday issued an interlocutor in which he finds for defender, with expenses. In a note, his lordship says the defender has certainly laid upon himself a heavy onus in undertaking to prove the truth of the ill report which for personal reasons he took up against the pursuer three months ago, and which he has repeated in his defences, and the onus had in his opinion been augmented by what he must characterise as the mistaken and unfair policy of the officials of the Pharmaceutical Society in withholding from the pursuer's agent facilities which they granted to the defender's agent for ascertaining facts affecting a right decision of the case. Indeed, the pursuer an adverse decision must be fraught with such consequences for him that the Sheriff would willingly give him the benefit of any reasonable doubt, but he was constrained by the evidence to return a verdict in favour of defender. It was admitted by Lambie that, having quarrelled with the pursuer some months after the Preliminary examination, he told some of his companions that he passed the pursuer's examination, and notwithstanding the gloss which he now seeks to put upon these words it was proved that his companions understood them in their natural sense—namely, as meaning that he had passed the examination instead of the pursuer. Indeed, the details given by one of those companions (Archibald Bald) showed that Lambie revealed to him the whole plot, and corroborated the evidence of Alexander N. Bowman ("the fellow from Kirkcaldy"). One passage in Lambie's testimony seemed to afford some ground for believing that he would have made a clean breast of the whole affair. In the witness-box if he could only have got a sufficient guarantee against subsequent proceedings against him. Unless the witnesses for the defence had, without any intelligible motive, conspired to say what was not true, it was clear that Lambie and not the pursuer passed the examination in question.—North British Daily Mail.

Press Comments.

REVOCATIONS OF PATENTS.—More patents have been revoked this year than in any year since the new Act came into force. A batch of four patents was revoked at the instance of the Pharmaceutical Society on the ground of no subject-matter. These patents were for medicinal compounds, and were in the names of Belland, Valsey, Kay, and Wilkinson. It is needless to add that these are compounds or mixing of known ingredients stands on a totally different footing from a new chemical process or a new chemical product.—Commerce.

WEIGHTS AND MEASURES ACT.—The verification and stamping of weights and measures have become under the officials of the Council a very comprehensive business. Offices have been provided in suitable London districts, and more than seventy officials have been employed to carry out this testing work. The number seems large in the aggregate, but spread over London it is relatively small. It aids, however, to

swell the total of County Council officials against which the Reactionaries, or Moderates, have been crying out. But look at what the men employed in this testing department have done. Last year they tested more than a million instruments used for weighing and measuring, and found nearly a quarter of a million to be unjust. One told many thousand unprofitable visits to such places as markets, stalls, shops, and stores, testing the scales, weights, and measures used in the sale of food and other commodities. As a result of these visits, to say nothing of the work above spoken of, they discovered nearly a thousand "unjust" cases. Of the offenders the greater—nearly one in three were punished, three paid many thousand pounds in fines, and nearly all these were convicted. That is work in which all London is interested, and though it is often unseen, it means an ultimate and substantial gain to the ratepayer.—Daily News.

'TRUTH' ABOUT ANTI SEPTIC FOOT POWDER.—I have to thank a great many chemists in different parts of the Kingdom, who, having seen a reference in Truth to an "antiseptic foot-powder" (see Supp., p. 28), have sent me recipes for the manufacture of such an article. Several of them assure me that their compositions are more or less identical with the one to which I referred, and one or two of them formulated foot powders, of course—in use in Continental Armies. As they all seem to be as nearly as possible identical with one another, I can readily believe these statements, but why they have not all received testimonials as gratifying as the one already noticed from the Adjutant-General I am quite unable to comprehend.—Truth.

PROPOSED MEMORIAL TO SIR HENRY ACLAND.—A decidedly ungracious controversy has arisen at Oxford over the contemplated memorial to Sir Henry Acland. The extension of the Acland House was generally regarded as the best testimonial to the late Regius Professor of Medicine, and that was the form most acceptable to himself. Now, however, Professor Ray Lankester has come forward with a proposal that the memorial shall be for the benefit of the Museum. Whatever may be the ultimate issue of the dispute it is sure to exercise a prejudicial effect on whichever scheme is selected.—Truth.

SPECIFIC FOR DROPSY.—A certain Hans Weber, of Stettin, sells and advertises largely a powder which, it is claimed, will cure dropsy. This marvellous specific, offered with medical recommendations and numerous testimonials of cures, is sold at a price which amounts to £5 a pound. Dr. Hoffman, of Stettin, bought some of this secret remedy, and had it analysed by the director of the laboratory of analysis at Darmstadt. The director found that the powder was composed, chemically, one-half of carbonate of lime, 12 per cent. of carbonate of potash, with variable portions of coal, clay, phosphate of lime, magnesia, and some other things, the whole from a chemical point of view being simply cagar ashes.—Maconet.

PHYSIC IN INDIA AND AT HOME.—Poor physicked Humanity! Dr. George Watt is quite concerned because the native Indian Hakims use at least double as many drugs as their English bulus-bearing brethren, and he wants more of them brought here for the benefit of Indian trade and the English valedinarian. What happy times are in store for us for the medical papers and the testimonial-giving doctors! When Mrs. Bensant has persuaded us to adopt Hinduism as a religion, and Dr. Watt, like another busy bee, has induced us to gather nastiness from every Indian flower, our souls and bodies will doubtless be all the better here and hereafter.—Weekly Times and Echo.
Poisoning Cases and Inquests.

Arsenic.—Lydia Antill Goodall, aged 22, died on Sunday, January 27, at South Halving, from the effects of arsenic contained in rat poison, self-administered. Verdict: "Suicide whilst of unsound mind."—

Choral Hydrate.—Thomas Stanley, aged 53, died at his residence in Hylton Road, Worcester, on Tuesday, January 28, from the effects of chloral hydrate, self-administered. Verdict: "Suicide whilst temporarily insane."—Worcester Advertiser.

Opium.—On Monday, February 4, an inquest was held at the Crown Inn, Wootton Bassett, on the body of an unknown man, who died on Sunday, February 3, evidently from the effects of opium, a bottle containing opium from which a dose had apparently been taken being found near. The coroner adjourned the inquiry.—Western Daily Press.

Nitric Acid and Quicksilver.—A shocking death through accidental poisoning was reported to the Bolton coroner on Friday, February 8. Isabella Madden, aged 44, wife of an umbrella hawker, took up a bottle which she thought contained whisky, and drank the contents. The liquid proved to be a mixture of nitric acid and quicksilver, and, notwithstanding medical skill, deceased died from the effects of the draught.—Manchester Evening News.

Oxalic Acid.—Edward Stares, a lance-corporal and tailor of the Hants Depot, died on Wednesday, February 6, at Winchester, from the effects of oxalic acid, self-administered. Verdict: "Suicide whilst temporarily insane."—Southampton Echo.

Carbolic Acid.—Alexandrina Olive, aged 26, died on Wednesday, February 6, in the Royal Infirmary, Manchester, from the effects of carbolic acid, self-administered. Verdict: "Deceased committed suicide whilst insane."—Manchester Evening News.

Phosphorus Liniment.—John Clarke, aged 48, died on Friday, February 8, at his residence, 2, Preston's Avenue, Gilda Brook, Ercoles, from the effects of a poisonous liniment administered by his wife in mistake for his medicine. Verdict: "Death from misadventure, and the jury also recommended that poisonous liniments should be put up in bottles having a shape distinct from those containing non-poisonous medicines, and approved of a new poison alarm signal, to be attached to poison bottles sold to them by the coroner."—Manchester Evening News.

Strychnine.—Gilbert Hughes Davies, aged 24, clerk in holy orders, died on Friday, February 8, at Spencer Road, Wandsworth Common, from the effects of strychnine, self-administered. Verdict: "Suicide whilst of unsound mind."—Echo.

Prussic Acid.—Alfred Clifton James, chemist's assistant, aged 20, died on Friday, February 8, at Dover, from the effects of prussic acid, self-administered. Verdict: "Suicide whilst temporarily insane."—Dover Telegraph.

Obituary.

S. M. BURROUGHS.

In our last issue we announced with regret the death of Mr. S. M. Burroughs, of the firm of Burroughs, Wellcome & Co., at Monte Carlo. It seems that Mr. Burroughs caught a severe cold in December last, and in order to recruit his health, and at the same time to visit his sister, Mrs. Rix, went to the Riviera. He had practically recovered from his cold, and was apparently in excellent health, when, whilst out cycling in the neighbourhood with his sister on the 2nd inst., he contracted a severe chill, on account of not being sufficiently clothed. The chill developed into pleurisy, which was followed on the Monday evening by pneumonia. Still, it was not until the Tuesday afternoon that Dr. Fagge, who attended him, apprehended any danger; even then, although Mrs. Burroughs was advised by cable to come from her home at St Albans, it was not thought that there was any immediate danger. However, the progress of the malady was so rapid that he passed away early on Wednesday morning. He was perfectly conscious until the last, and although in some pain at first, the end was quite painless. Mrs. Burroughs arrived too late to see him before his death, but was met at Marseilles by Mrs. Naftei, who broke the sad news to her. The burial service took place on the 8th inst., in the Protestant part of the Monte Carlo cemetery. The relatives of the deceased acknowledge the kindness they received on all hands at Monte Carlo, and especially from Mr. Croce and Mr. Naftei, pharmacists of Monte Carlo; Mrs. Callé, of Monte Carlo, and Mr. and Mrs. Squire, of San Remo. Mr. Burroughs great generosity was well known to pharmacists. He was a liberal contributor to the Benevolent Fund of the Pharmaceutical Society, and recently he endowed the Darwin College Hospi- tal with £1000. Educational movements always had his sympathies, many associations throughout the country having benefited by prizes offered by the firm of which he was a member, and at social gatherings connected with pharmacy he was a regular patron and frequent attendant.

Notice has also been received of the death of the following:—

On December 31, Andrew Fraser, Chemist and Drug- gist, Durban, South Africa. (Aged 44.) Mr. Fraser had been an Associate of the Pharmaceutical Society since 1870.

On January 19, James Binlle, Chemist and Drug- gist, Edinburgh. (Aged 51.)

On January 28, George Edmonds, Chemist and Drag- gist, Iate of Kensington. (Aged 52.)

On February 4, Henry V. Baker, Chemist and Drug- gist, late of Wimborne. (Aged 54.)

On February 9, John Stanley Urmandy, Chemist and DRUGGIST, Dalton (Aged 54.) Mr. Urmandy had been a Member of the Pharmaceutical Society since 1875. He was also Justice of the Peace and Councillor for the borough of Barrow-in-Furness.

Publications Received.

Novelties.

[Under this heading it is proposed to publish, from time to time, descriptions of new appliances and apparatus, and other novelties of interest to pharmacists. In submitting such articles for notice, full particulars should be sent accompanied, if possible, by a block of suitable size for the Journal columns.]

**NEW MICROSCOPES.**

The "Star" Microscopes of Messrs. B. and J. Beck, Ltd., 68, Cornhill, have recently been considerably improved in style, and received a very neat addition in the shape of a focusing and swinging substage, carrying an Abbé form of condenser with an Iris diaphragm, as figured below. The price of this piece of apparatus is $30. The other illustration shows the "Improved Continental" Model Microscope, by the same makers. This seems to be a very compact and serviceable instrument. It is built perfectly solid, thus avoiding the use of packing pieces to keep it rigid. The large square stage allows of the examination of culture plates and dishes, and upon removing the stage clips, the new form of mechanical stage can be attached in a few seconds. The fine adjustment of this instrument is exceedingly delicate in action. Further particulars can be obtained from Messrs. Beck's new 80 pp. catalogue, which appears to justify its description, as being a complete dictionary up to date of instruments and apparatus used in microscopy.

**UNIVERSAL BACTERIA MICROSCOPE.**

In describing this new instrument last week (Supp., p. 41), it should have been stated that the available magnifying power ranged from 40 to 1600 diameters, and a cylinder diaphragm, an Abbé condenser, and a mahogany case for the microscope were included in the price—$10. An Iris diaphragm or a larger Abbé condenser can be fitted at extra cost, if required. The inventor and maker of the instrument, Ed. Meister, Westend bei Berlin, Germany, has endeavoured to specially adapt it to the needs of physicians, pharmacists, and others who may have frequent occasion to use a microscope for the examination of urine, sputum, etc., and only a limited time to devote to the purpose.

**NEW VIEW FINDER AND LEVEL.**

The two illustrations show combinations of the View Finder and Level for use with Camera, made by Mr. J. J. Hicks, Hatton Garden, E.C. They are supplied in different sizes, and variously modified to suit different cameras. They appear to affect a saving of time, and ensure greater accuracy.

**PATENT OFFICE BUSINESS.**

**APPLICATIONS FOR PATENTS.**

[Compiled from the Illustrated Official Journal (Patents). Where complete Specification accompanies Application, an asterisk is suffixed.]

No. 420.—Edward Acres, Clovelly, Barnet, Herts.—Improved form of photographic plate-holder and casing for same. January 7, 1896.

No. 453.—Frederick William Eames and Hubert Cresy, 30, Perth Road, Finsbury Park, London.—A new apparatus for rapidly cooling sugar or analogous material in a liquid form. January 8, 1896.

No. 518.—Wensel Teditaky, 77, Chancery Lane, London.—Medical tablets or cakes for addition to baths. January 8, 1896.

No. 558.—Humphrey Humphreys, 4, Corporation Street, Manchester.—Improvements in sanitary towels. January 9, 1896.

No. 628.—John Fred Davies, 23, Coleman Street, London.—Improved distributor for insecticide, disinfectant, and other powders.® January 10, 1896.

No. 720.—Arthur Clifford Granville, 97, Curzon Street, Chancery Lane, London.—Apparatus for transforming oxygen into ozone. January 11, 1896.

No. 884.—Mary Anne Hicks, 57, Chancery Lane, London.—A curative or antisepsic compound, applicable for use as a salve or as a plaster or the like. January 13, 1884.

No. 885.—Richard William Hill, 97, Newgate Street, London.—Production of liquid ammonia by electricity. January 14, 1885.

No. 886.—Adolf Bölander, 44, Southampton Buildings, Chancery Lane, London.—Improvements in devices for preventing the refilling of bottles. January 14, 1885.

No. 888.—Frederick Booth Thatcher, 11, Southampton Buildings, Chancery Lane, London.—Improvements in bottle stoppers. January 15, 1885.

No. 890.—Henry Edward Newton, 6, Brean's Buildings, Chancery Lane, London.—The manufacture or production of chemical compounds. (The Parbenzfabrik Vorwärts Friedrich Bayer & Co., Germany.) January 15, 1885.

No. 891.—Alwin Goldberg and Wilhelm Siepermann, 4, South Street, Finsbury, London.—An improved process for the preparation of sulphydo-cyanides. January 15, 1885.

No. 892.—Ernest George Scott, 4, South Street, Finsbury, London.—Improved process for the manufacture of soctic acid. January 15, 1885.

No. 1110.—George Thompson and William Thompson, 2, Market Street, Bradford.—A new or improved instrument or appliance for administering medicine to horses, cattle, sheep, dogs, or other like animals. January 18, 1886.

Specifications Published During February.

Double Soda Salt (Johnson, G. S.).—Contains the preparation of a double salt consisting of two molecules of sodium sulphite, one molecule of sodium carbonate, and twenty-one molecules of water. The salt is said to be stable in air, and to be only slowly oxidised when in strong solution, but the solution behaves as a mixture of sulphite and carbonate when the compound is dissolved in four parts of water. No. 143 of 1884.

Petroleum Compounds.—Patents have been published, one by C. Weygang (No. 3025 of 1884) and the other by the same in conjunction with the Petroleum Syndicate (No. 23,996 of 1884). The inventions are very similar, and comprise the production of petroleum compounds suitable for soap, lamp black, varnish, vehicle for paint, insecticide, etc. The procedure varies according to the proposed use, but consists in the admixture, under stated conditions, of petroleum with one or more of the following substances:—caustic alkali, palm, coconut, linseed, cottonseed, castor or other oil, resin, mastic, thallous, tar, benzole, carbonates, borax, calcium chloride, zinc sulphate, and salts of iron. For use as fuel, powdered coal, or with or without calcium gypsum, is used. Nos. 3025 and 23,996 of 1884.

Filter (Lipscombe, F. R.).—The filter is so constructed that the water passes through perforated pipes or round baffle plates in such manner as to expose it to the filtering medium. The filter may be worked by gravitation, suction, or pressure. No. 3887 of 1884.

Bromochlorid or Vapour-bath Kettle (Cole, C. H.).—The kettles are removable, having legs and a handle. It has no spout and its lid is replaced by a chamber having a perforated bottom on which a "mediated preparation or camphor bag" is placed. The steam is thus medicated while escaping at the perforations. No. 4593 of 1884.

Cigarette Tubes, &c.—The cap of a collapsible metal tube, perfumed bottle, etc., is fitted to a pivoted piece swinging on the neck. It has a plug which is caused to close the vessel by a spring or screw, and the vessel is opened by raising the plug and turning the pivoted piece aside. No. 4853 of 1884.

Osmose (Schmeller, A., and Wiese, W. J.).—A modification of the ordinary osmotic apparatus is used in a transformer or other source of high-tension electricity being employed. The invention consists mainly in inserting a resistance between the transformer and one or both of the discharge surfaces to prevent production of volatile arcs and to ensure a sparkless discharge. No. 5069 of 1884.

Vescometer (Loehstein, T.).—The invention is intended to obviate the error commonly introduced by rise of the liquid on the scribe from the oscillations of the vessel. It comprises the use of a bulb which floats with its upper surface, which is ground at right angles to the axis, level with the surface of a liquid having a specific gravity of 0.7000 at 18° C. The upper end of the bulb carries a spindle on which hangs a frame carrying a pen. In testing liquids heavier than 0.7, weights are placed on the pan as usual. No. 5656 of 1884.

Ferrocyanide of Potassium or Sodium (Hetherington, A. E., and Masprut, E. K.). Iron in the form of filings, etc., is mixed with melted pitch and heated to reduce any iron oxide to metal. The mass is then mixed with sulpho-nitrate of potassium or sodium and heated to 700° or 800° F. The product is then washed, and carbonised salt is blown through the filtered solution to convert the potassium or sodium sulphide which has been formed, into carbonate. The ferrocyanide is finally crystallised out. No. 5880 of 1884.

Alloys of Potassium or Sodium with Lead (Hetherington, A. E., and Hurter, F.).—Comprises the production of alloys of potassium or sodium and lead, rich in the alkali metal, by the electrolysis of fused caustic alkali, using a cathode of molten lead and an anode of iron. No. 5831 of 1884.

Making Compressed Tablets and Pills (Thomas, L.).—A machine is used in which both the dies and punchers are alternately withdrawn from the mould, thus preventing clogging and facilitating cleaning. No. 8,124 of 1884.

Electrolysis (Richardson, J. C.).—In the electrolysis of fused alkaline salts, etc., a second cathode of copper oxide is added to the commonly-used mercury cathode. The hydrogen which is liberated by the action, reduces the copper oxide to metal, and is thus prevented from polarising the cathode. No. 22,618 of 1884.

Personal and Trade Notes.

The new price-list just published by Mr. C. Bakor, of High Holborn, W.C., shows evidence of very thorough revision, and serves as a useful guide in comparing the different makes of foreign microscopes, objectives, etc., with those of home manufacture.

Mr. James Eggo, manufacturing chemist, Birmingham and London, submits a sample of Dr. Tiblee's "Vi-Cocoa," which is described as being prepared from malt, hops, kola, and cocoa. The malt is added to assist in digesting starchy matter, hops for their soothing and tonic effect, and kola and cocoa for their sustaining properties.

Messrs. W. Phillips and Co., chemists, Lewisham High Road, London, S.E., have dissolved partnership.

A surgical instrument shop has been opened by Messrs. Allen and Hanburys, Limited, in Wigmore Street, W.

Mr. J. O. Stringer has purchased the business carried on by Mr. C. J. Griffiths, at Kingston-on-Thames.

Messrs. A. and M. Zimmermann, Cross Lane, St. Mary-at-Hill, E.C., have been appointed agents for Lherberrg and Holm's "Alummin Malrose," a new food for invalids. This preparation is also supplied in combination with iron in a soluble form, the product being free from astrigency.
Diary of the Week.

Sunday, February 17.

Sunday Lecture Society, at 4 p.m.
How Discoveries are Made—a Study in Scientific Method” (Illustrated), by Professor Henry B. Armstrong.

Monday, February 18.

Imperial Institute.
House Dinner at 6:45 p.m.
“The Elements of Photography” (Illustrated), by Capt. W. de W. Almquist.

Society of Arts, at 4 p.m.
“Means for Verifying Ancient Embroideries and Lace” (Second Lecture), by Alan S. Cole.

London Institution, at 5 p.m.

Victoria Institute, at 4:30 p.m.

Tuesday, February 19.

Royal Institution of Great Britain, at 5 p.m.
“The Internal Framework of Plants and Animals” (Sixth Lecture), by Professor Charles Stewart.

Society of Arts (Foreign and Colonial Section), at 8 p.m.
“Papaya,” by A. F. Ballieux.

Central London Throat, Nose, and Ear Hospital, at 4:30 p.m.
“The Treatment of Disease causing Discharge from the Ears,” by Dr. Dundas Grant.

Aberdeen Chemists’ and Druggists’ Assistants’, and Apprentices’ Association, at 9:30 p.m.
Short papers.

Wednesday, February 20.

Imperial Institute.
Concert Dinner at 6:30 p.m.
Ladies’ Concert at 8:30 p.m.

Society of Arts, at 8 p.m.
“Rule of the Road at Sea,” by Admiral P. H. Colomb.

Royal Microscopical Society, at 8 p.m.
Ordinary Meeting.

Geological Society of London.
“Contributions to the Palaeontology and Physical Geology of the West Indies,” by J. W. Gregory.

Western Chemists’ Association (of London), at 9 p.m.
Discussion on “Prescribing by Chemists,” introduced by J. C. Hylop.

Edinburgh Chemists’, Assistants’, and Apprentices’ Association, at 9:15 p.m.
Apprentices’ Night. Conducted by Alex. J. Dey.

Thursday, February 21.

Imperial Institute, at 8:30 p.m.
“Photography as Applied to the Production and Reproduction of Pictures” (Illustrated), by George Davison.

Royal Institution of Great Britain, at 8 p.m.
“Meteorites” (Second Lecture), by L. Fletcher.

London Institution, at 7 p.m.
“National Song” (Illustrated), by Professor W. H. Cummings.

Linnaean Society of London, at 8 p.m.

New Marine Algae from Japan,” by E. M. Holmes.

Chemical Society, at 8 p.m.
Election of Fellows.

“The Electrifying Force of an Iodine Cell,” by A. P. Laurie.

“Contributions to the Chemistry of Cellulose,” by Messrs. Cross, Bevan, and Beadie.

Chemists’ Assistants’ Association, at 8:30 p.m.
“Power of Rome,” by F. Ramsay.

Liverpool Pharmaceutical Students’ Society, at 8:30 p.m.
“Some Recent Developments of Bacteriology,” by J. B. Logan.

Glasgow and West of Scotland Pharmaceutical Association, at 9:15 p.m.
“Mental Hygiene,” by Dr. John Carlaw.

Friday, February 22.

Royal Institution of Great Britain, at 9 p.m.

Sheffield Microscopical Society, at 9:30 p.m.
“A Practical Demonstration in Grinding and Preparing Sections from Hard Tissue,” by W. B. Tolpa.

Saturday, February 23.

Royal Institution of Great Britain, at 3 p.m.
“Moore’s Irish Melodies” (with Musical Illustrations), by Sir A. C. MacKenzie.

Exchange.

WANTED.

‘JOURNAL OF BOTANY,’ 1891, 1892, 1893, and 1894—Librarian, 17, Bloomsbury Square, London, W.C.

‘THE ANALYST.’—Volumes or numbers from 1896 to 1899 inclusive. State price, which must be moderate. Johnson, care of J. Robinson, 125, South Lambeth Road, S.W.

OFFERED.

Mahogany Copying Camera—14 by 14, single slide, carries to 6 by 4, Harrison’s Head Rest, exchange for 12 by 10 or 15 by 12 camera (Field), with 2 or 3 slides. McMurry, Chemist, Helsengrath.

‘REVIEW OF REVIEWS.’ 1894, unbound, clean. Offers, cash or exchange, to A. H. Hinde, Chemist, Lowestoft.

Trade Marks Applied For.

[Compiled from the Trade Marks Journal.]

No. 88,707. — ARGOMINE. Chemical substances prepared for use in medicine and pharmacy.—Die Farbwerke vorm. Meister Leutz und Brüning, Hoechst a Main, Germany November 16, 1894.

No. 88,855. — QUINELLA. A medicine for inflammation of the bowels in canaries, poultry, and pigeons.—Frederick Tibles, 80, Parkhurst Road, HOLLOWAY, London. November 25, 1894.

No. 88,653. — ANTHIM. Two crossed triangles with double oval crossed by the word “Anthim.” The essential particular is the device. Chemical substances used for phototherapy.—The Chemische Fabrik und Aktion (warrants E. Schering), 170, Müller Strasse, Berlin, Germany November 14, 1894.

No. 88,164. — EUREKA. Devices on a shield with the word “Eureka” above. The essential particular is the device. Chemical substances used for agricultural, horticultural, veterinary, and sanitary purposes, except for soap and goods of a like kind.—Tomlinson and Co., Wood, Mint Street Chemical Works, Lincoln. July 21, 1894.

No. 88,924. — VIGONE. A compound of hypophosphite, being a medicinal preparation for human use.—Edouard Jones, Medical Hall, 80, Miles Bank, Hanley. November 23, 1894.

[The quotations given here are in all cases the lowest net cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the pharmacist. It is evident that it would be misleading to make any comparison between these prices and those of the wholesale drug trade.]

THURSDAY, FEBRUARY 14, 1886.

We are unable to record any improvement in the Chemical Market this week. It is, in fact, hopeless to look for any until the frost breaks up, as it has proved a great impediment to the delivery of consignments. The prices are for the most part unaltered, yet the tone of the market is very weak, and where changes have taken place they have been on the down line. Citric and tartaric acids are at a discount at last week's prices. Oxalic acid is very steady, without any alteration in price. With respect to ammonia compounds, sulphate is decidedly easier. This is, however, unaccompanied by any reduction in carbonate or arsenic acid, which are quoted at the old prices. Arsenic is unchanged, without being in large supply. The weak tone of the cream of tartar markets has been maintained; it was, in fact, at the early part of the week fractionally easier, but closed unchanged. Bleaching powder is unchanged, as are also mercurials and quicksilver. Copper sulphate is steady at unchanged rates. With respect to quinine, a decidedly firmer tone prevails for the German article, and a corresponding rise has ensued. Sodium and potash compounds are practically unchanged.

Details:

ACID, BORAXIC.—Prices still reported are: Crystal, 36s.; powdered, 32s.

ACID, CITRIC.—No movement of interest is to be noted, the market being very dull. Still offered at 1s. 1d. to 1s. 3d.

ACID, OXALIC.—Supply and demand are very fairly balanced, and prices remain unchanged at 8d. 6d. rails.

ACID SULPHUROUS AND THE SULPHATES.—The quotations remain unchanged, being to a great extent controlled by the syndicate manufacturers.

ACID, TARTRIC.—Nothing of interest has transpired, and the low quotations which were noted last week have not been improved on. English makers still quote 10d. to 11d. Forage ditto, crystals, 10½d.; powder, 10d.

AMMONIA.—A quiet market. The probability of further declines which was in evidence last week, has been fulfilled, prices being 5s. 6d. lower. Quotations: Grey, 24 per cent., 21s. 6d. 6d. Carbonate: No change; the market is very steady, being quite uninfluenced by the variations in sulphate. Indurate, 1s. 9d. to 3d. Soda bicarbonate, 6½d. Business continues steady at unchanged prices. Quotations: first quality, 8s.; second ditto, 8½d.

ASHES.—Steady at unchanged rates. American is still quoted at 40s. with pots at 35s.

ASBESTOS.—The market remains quiet, yet supplies are limited. The quotations stand 14s. 0d. to 15s.

BLEACHING POWDER.—Business fairly brisk, with no signs of recession. Prices 5s. 6d. to 6s. 6d.

BORAX.—In steady demand at last week's prices. Quotations: Crystals, 30s.; powder, 21s.

COPPER SULPHATE.—The prices still remain high. In fact for cheaper brands a fractional advance has occurred. Quotations: Ordinary brands, 21s. 17s. 6d.; special ditto, £1 15s. 10d.

CREAM OF TARTAR.—No improvement on last week's fall to be noted, the market remaining very quiet. Fine white crystals are still quoted at 85s., whilst powdered is worth 65s.

MERCURIALS.—Unchanged. Quantities up to 25 lbs. are quoted: Calomel, 3s. 9d.; red precipitate, 5s.; white do., 5s.; corrosive sublimate, 6d.

POTASH COMPOUNDS.—The market is quiet, but fairly steady. Frussiate has not declined further, but remains quiet at 9½d. to 10d. Chlorate is weaker at 4½d. Bleaching powder, 6d. to 7½d.

QUICKSILVER.—Unchanged; the uniformity between the quotations of first and second-hand holders continues, the two being practically identical. First hands, £2 10s.; second ditto, 2½s. 0d. to 2½s. 10d.

QUININE SULPHATE.—The market has afforded a market contrast to that of the previous week, and indicates a firmer tone for the German article with a considerable rise in price, and probability of further advances. The quotations include Bremen 5000 oms. Grosnack at 11d., and 25000 oms. B and S and Grosnack at 11½d. to 11¾d. The demand has been very brisk, and 13d. has been paid. This is fully 3d. to 1d. higher than ten days since.

SODA COMPOUNDS.—Quiet at unchanged rates. Caustic is quoted at 25s. 0d. to 26s. 0d. per cwt., with 60 per cent. at 21 less. Crystals unaltered at 8s. 6d. Bicarbonate also remains at 27s. 6d. (London).

THE DRUG MARKET.

ALOE.—The market is quiet, but steady. At last week's sales the quotations for Cape were higher, with East Indian steady. Of a parcel of 299 packages Curaçao offered, 16 sold fair lively 46s. to 55s. Forty-four guards and 12928s. Carbades, offered without reserve, fetched 6s. 6d. dull lively.

BENZOIN.—Steady. Fine Sumatra fetched high prices. Bold first quality as much as 215 10s. Fine clean one sold at 27s. to 28s. 6d.; fine, 21s.; fair, 29s. 5s. Pennang seconds, glassy yellow, 75s.

BUCHU.—Dull. At the sales two bales of good short green leaves were sold out of a parcel of 18 bales at 8½d. per lb.

CASCARA.—Of 50 bales of fair quality sold at small to bold delivery, 5½d. to 6s.; damaged back, 4½d. to 5½d.

CINCHONA.—Remains quiet. Loxx sold at 1s. to 1s. 3d.; fair flat Calisaya, 10½d., with damaged back, 1½d. to 7½d. (A.R.): Steady; is quoted 1s. 2d. to 1s. 3d., the latter being obtained for good quality white.

CAMPHAL.—The demand is very firm. After declining in the market for some time, has now advanced in price. English refineries notify an advance of 1½d. For half-ton quantities of camphor in bills, quotations are 1s. 4½d. (C.D.): Steady; is quoted 1s. 3d.; for good quality; second, 8s. 6d. to 9s. 6d.

CYPRESS.—The market is very firm, and prices are dearer. It is now sold without pret. Good Buo (Brazilian) root is worth 6s., with inferior 4s. 6d. to 6s. 6d. Carthage (New Grenada) is quoted at 4s. for good quality; second, 8s. 6d. to 9s. 6d.

CUPRUM.—Very steady. At the sale a parcel of seventeen bales was retired, very firmly held. Privately, fair Vera Cruz is selling at 5½d.

FENUGREEK is quiet. At the sales, native plucked gum fetched 25s., siftings, 45s., fair pickings, 54s.

OILS (essential).—From all we can learn the oils of Neroli, lavender, and in fact all oils, the produce of Greece, the surrounding district will command much higher prices, owing to the inclement weather.

OILS (fixed) AND SPIRITS.—Cod liver: Quotations continue to advance, in fact there seems to be no limit to the price which it may reach. The severity of the weather has proved a great impediment to delivery. We hear of one importer whose consignment, although it arrived in the Thames on Monday, has not yet been landed on account of the being unable to get Pietsen not furnishing oil. Cones containing oil is worth 200s., per barrel of 25 gallons net, in Norway, and if reports are to be relied on, we may expect to have still higher prices. Pine old is quoted at 175s. per barrel of 25 gallons. Pure kerosene oil has advanced 1d. For quantities of half a ton, 8d. would be accepted. Linseed: The market is very firm and the prices are continually on the up line, owing to a poor supply, as cargoes cannot be landed. £2 7s. 6d. is now widely paid, £2 10s. 0d. being asked. Pietsen not in quiet demand, and a trifle easier. The refined article is worth £2 7s. 6d. to £2 18s. according to the brand. Coco-nut: Steady; Ceylon, £2 23s. Coochin, £2 25s. Rose: Steady at unchanged prices, refined oil being worth £2 3½d. Terpentine: Very steady at increased rates. Quotations for American spirit are 21s. 9d. to 23., Petroleum: Steady, at a fractional advance. Americans 4½d. to 4½d.; Russian, 4½d. to 4½d. Petroleum Spirit. Ordinary, 7½d.; desolator 7½d. to 7½d.

OPium.—Although amount of business done is but small, the market remains very firm in tone. Turkey
Best selected is quoted at 12s. to 12s. 6d.; ditto seconds, 11s. to 11s. 6d.; "druggists," 9½ lb. to 11s. Persian is firmly held at 11s. to 12s.

SHELLAC. The market is fairly steady, and prices remain firm, although sales are small. There is little disposition to operate speculatively, and privately the demand is slow on a basis of 110s. to 112s. for TN orange. At the last sales an advance of 5s. on the previous rates for mixed grades was reported. Inferior grades are steady, but little doing. Of a total of 832 cases offered, 480 were sold.

TOLU BALSAW.—Firm, in fair demand, quotation being 1s. 2d. for good qualities.

COPPER.—The prices are very firm, there being but little offered and readily bought up. Quotations, 1s. 4d. for black and 1s. 4½d. for silver.

WAX.—In rather poor supply. Madagascar: 'Mixed grey and yellow wax is worth £7 5s., with grey, £7. East Indies: Good quality yellow Madras, £6 15s. to £7. Japan: No sales to be noted. Jamaica: Good pale wax sold at £8 5s. Cape: Fine yellow, £2 2s. 6d.

**Late News.**

**SHEFFIELD PHARMACEUTICAL AND CHEMICAL SOCIETY.**

—At the meeting of this Society on Wednesday night Mr. J. F. Eardley, the President, occupied the chair, and amongst those present were Messrs. G. T. W. Newsholme, G. Ellinor, G. Squire (sec.), and others. The proceedings were opened by a discussion on the subject, "Does the Sheffield School of Pharmacy provide sufficient tuition for its students?" Mr. Mallaband read a paper to open the debate on the negative side. The unsatisfactory state of the school from a student's point of view was regarded as the result of apathy on the part of the students, but he contended that the fault lay with the school itself. Too much was attempted, especially in chemistry, the session's curriculum containing, in his opinion, enough for three sessions. Therefore there was inability to do the work thoroughly, and the lecturers were often unjustly blamed. He advocated an adjustment of the curriculum on the lines of the Science and Art Department, and suggested a course of study which he believed would produce better results, both with regard to the school and the students attending it.

The President agreed that the syllabus was too extensive for one session, and suggested that if the students were to rally round the Society something might be done to remedy that. He did not think a chemist should take three or four apprentices unless he could allow them sufficient time for study and attending lectures. Mr. G. T. W. Newsholme did not think any advantage would come from going on the Science and Art Department lines. He argued that the syllabus was too big, and expressed the opinion that a compulsory curriculum was desirable. The time was coming when the members of their body would have to be much better educated than they were to-day. Other speakers followed, and the usual vote of thanks was passed.

**A BRADFORD CHEMIST’S OFFENCE UNDER THE EXCISE ACT.**—On February 12, at the Bradford Borough Court, action was taken by the Board of Inland Revenue against William Cockshott, chemist, Westgate, Bradford, for having sold tincture of arnica in the preparation of which methylated spirit had been used instead of rectified spirit of wine.—Mr. J. A. Wallace, Acting Superintendant to the Board of Inland Revenue, Bradford, prosecuted, stating that the charge was laid under a section of the Spirits Act of 1880 which prohibited the use of methylated spirit in any preparation capable of being used as a beverage or for medicine to be internally applied. The charges were six for two reasons, one being that there was no Excise duty on methylated spirit, which was extensively used for manufacturing purposes, while there was a heavy duty on rectified spirit of wine; again, it was desirable that the public should get the genuine article. On December 6 an officer of the Board of Inland Revenue purchased at the defendant's shop a 1 oz. bottle of arnica which had been prepared with methylated spirit, rendering the defendant liable to a fine of £100. —Evidence was given by the officer in question and an analyst of the Board of Inland Revenue. The defendant pleaded not guilty, stating that he had been in business in Westgate for fifty years, and this was the first charge of any kind which had been brought against him. He was ignorant that such a preparation was on his premises, and he had never sold it. His son attended to the shop, but he did not think he had made up the preparation for ordinary sale.—The defendant was fined £3, without costs. —Bradford Observer.

**JUNIOR PHARMACY BALL.**—The fourteenth Junior Pharmacy Ball was held at the Portman Rooms, London, on Wednesday last. More than 400 guests were present, and Mr. Michael Carteighhe took the chair at supper. After proposing "Successes to the Junior Pharmacy Ball" and "The Ladies," the Chairman called for a hearty vote of thanks to the Committee, and especially the Honorary Secretary, and at the same time announced that boxes had been placed in the room for contributions to the Benevolent Fund of the Pharmaceutical Society, as the low price at which the tickets were sold left a lower margin of profit for the Fund than was desirable.

The Honorary Secretary (Mr. H. Arliss Robinson) replied for the ladies, and with becoming modesty insisted that his success was mainly due to the efforts of the stewards, some of whom had disposed of more than thirty tickets, and to the Portman Rooms Company, whose catering was most satisfactory.

Among the ladies present were Mrs. Carteighe and Mrs. T. C. W. Martin, Mr. T. C. W. Martin, assisted by Mr. G. W. Martin, once more acted as M.C., and amongst other gentlemen present were Messrs. T. H. W. Idra, L.C.C., Richard Bremlidge, and J. C. Umney.

**LATE ADVERTISEMENTS.**

**Business for Disposal.**

£150 (part can remain), Bristol.—Retail and Prescribing. Returning, through being neglected, £2 a week. Lately did £12, and can again. Good house, which could be let off. Private back entrance. Amply equipped. Business must sell at once, having other business in hand. Fortunate to a young energetic man. Well established. Beautifully fitted. Main thoroughfare. Chemist, 135, Lawrence Hill, Bristol.

**Engagements Wanted.**

MANAGER or ASSISTANT. Qualified. Married. 25. Country preferred. West-end and provincial experience. Good references. Address, BROM, 5, Serie St., W.C.

MANAGER. 31. Married. First-class experience. Excellent references. BORAX, 5, Serie St., W.C.

Notes.

NEW LABORATORY AT ST. PETERSBURG.—The new chemical laboratory at St. Petersburg University has cost £35,720, and fulfils all the requirements of modern scientific research. Special rooms are allotted to physical chemistry and accurate physical measurements, and the arrangements for each separate worker are said to be perfect.

HUNTERIAN ORATION.—The Hunterian Oration on the 166th anniversary of the birth of John Hunter was prepared by the late J. W. Hulke, President of the Royal College of Surgeons, and read on February 14 by Mr. Bryant. Its subject was “John Hunter, the Biologist,” and the writer dealt at length with Hunter’s acuteness as a field naturalist and his skill as a zoologist and morphologist.

S. M. BURROUGHS’ MEMORIAL.—A preliminary list of subscribers to the Burroughs’ Memorial Fund is now being distributed (see p. 73), and subscriptions may be forwarded to Mr. John Moss, 29, Treasillan Road, St. John’s, S.E. It is proposed that the Memorial should take the form of a Pharmaceutical Scholarship or a special Benevolent Fund.

GREENOCK PERSONATION CASE.—The appeal in this case has been postponed on account of the indisposition of the Sheriff, and will probably not be heard before March 11.

MASONIC PRESENTATION.—At a special meeting of Oban Lodge Commercial, No. 180, on Tuesday, February 19, a Past Master’s jewel was presented to Bro. S. Lawrence, chemist and druggist, as a mark of appreciation of the valuable services rendered by him to the craft, in the capacity of Master of the Lodge for the past three years. It was accompanied by a gold brooch, set with pearls, for Mrs. Lawrence. Mr. Lawrence was for some time a member of the Executive of the North British Branch of the Pharmaceutical Society.

EFFECTS OF THE FROST.—Mr. J. A. Cope, Pharmaceutical Chemist, Derby, sends a photograph of a bottle of Hunyadi Janos Mineral Water, which curiously illustrates the effects of the recent severe frost. During the night of February 7 the contents of the bottle became partially frozen and the cork was forced out, remaining attached with the capsule to the top of a projecting rod of ice. The next morning further freezing and expansion took place, and another length of the ice rod was forced out. The general appearance is that of a candle stuck in the bottle-neck.

CHEMISTS’ ASSISTANTS’ ASSOCIATION.—The seventeenth annual dinner of this Association takes place at the Cannon Street Hotel, on Thursday next, March 7, at 8 p.m., when the chair will be taken by Mr. Walter Hills, of the firm of John Bell and Co., member of the Pharmaceutical Council.

DEATHS OF CORRESPONDING MEMBERS.—Two corresponding members of the Pharmaceutical Society have recently died—Andrew Ferrin, M.C., of Moscow, Member of the Moscow Board of Health, and Jean Eduard Bonnier, Professor of Botany at the University and Curator of the State Botanical Gardens, Brussels.

WEIGHTS AND MEASURES.—Mr. H. J. Chodz, superintendent of the Standard Department of the Board of Trade, gave evidence before the House of Commons Committee on this subject on February 26. He showed there were many weights and measures in use in the United Kingdom which are not legally recognised, instancing the ball, the ell, the oomb, the Winchester bushel, the butcher’s stone of Sib., the miner’s dish, and the gauge, as used in measuring plates. He also stated that, practically, the only two countries of any importance in Europe in which the metric system was not adopted were Great Britain and Russia.

COPPER IN GREEN PEAS.—In a case heard at Edmonton last week (see p. 72) a conviction was obtained for using copper to preserve the colour of green peas. Copper was stated to be present to the extent of 0.7 grain per pound. In the case recently dismissed at Bristol, the amount of copper found was only 0.205 grain.

BUSINESS CHANGES.—The drug business carried on by Mr. Sydney Keith, at 69, South Clerk Street, Edinburgh, has been purchased by Mr. Jeremy Blenkiron, principal assistant to Mr. J. C. Pottage, 117, Princes Street, who is to enter into possession on Monday, March 4.

POISONING BY CHLORODYNE.—In reply to the communication received by Mr. William Thomas from the coroner, Dr. Danford Thomas (Ph. J., ante, p. 713), directing his attention to the danger to the public safety incurred by not labelling his chlorodyne “poison,” Mr. Thomas states that no chlorodyne has been sold at either of his establishments except what was properly labelled in accordance with the Pharmacy Act, “on the outside wrapper.” As previously noted, objection was taken by the jury to the omission of the word “poison” from the label on the bottle itself.

THE ETERNAL NEWS.—In this work, Mr. John Jarvie Brown, chemist and druggist, discusses at length concerning “time and space, substance, motion and shape—the entire total of all being or existence.” “Substance is spirit,” he remarks, but more of his Scottish friends will probably agree with his converse proposition, that “spirit is substance.” In the prefixed readers are asked to mark what they believe in the book, and let the author know the result, as opinions sent to him “will be prized and preserved as of likenesses of fellow spirits.” The general style of the work will be familiar to those who have perused Mr. Brown’s Iuboration, published in the Journal recently.
Miscellaneous News.

[Readers are invited to send local information of pharmaceutical interest. When newspapers are sent the paragraphs to be noted should be plainly marked, whilst cuttings should be verified by the addition of sources and date.]

COPPER IN GREEN PEAS.—On Thursday, February 21, at the Edmonton Petty Sessions, before Mr. J. W. Latch and Mr. H. Mears, the Westminster, Keverton and Tong, grocers, of 186, Fore Street, Edmonton, were summoned for selling an article of food—a tin of green peas, which were coloured or stained by the aid of copper to the extent of 7/10ths of a grain of copper per pound, thereby rendering them injurious to health. Mr. A. H. Bodkin prosecuted for the Middlesex County Council, and Mr. Walter Beard defended.—Dr. J. E. Gyres, medical officer for St. Pancras, and Dr. Dupré and Dr. Luff, analysts to the Home Office, stated that sulphate of copper was a poison which, if taken into the system in the quantities found in the peas, would produce chronic copper poisoning. It was used to make the peas retain their glossiness, and the effects would be most injurious, especially to a weakly person.

For the defence, Mr. Beard said that there were 16,000,000 tins of the peas imported annually, and yet there was not one known case where it was shown that they had produced any injurious effects. He called Mr. Otto Hahner, public analyst for Nottinghamshire, who said, though there was more than the usual quantity of copper in the sample in question, he did not think it would produce the effects suggested by the prosecution. After a hearing lasting over four hours, the Bench convicted the defendants and inflicted a fine of 20s. and 20 guineas costs. Notice of appeal was given.—Daily Telegraph.

PHARMACEUTICAL FOOTBALL CLUB.—Having been prevented from playing by the frost for four weeks the Pharmaceutical club were eager for the game fixed with the London Welsh for last Saturday. The weather was splendid and the ground, although not really hard, was in good condition. At the last match, played on the ground of the London Welsh, they won by two goals to one, and it was now expected that the Square team, being in good form and playing on their own ground, would equalise matters. The Welshman, however, found themselves by some chance three or four men short, and two or three more being alarmed at this also disappeared. Through an accident to one of the players in the cup-tie between Hammersmith Athletic and Shepherd's Bush on a neighbouring ground that match was stopped, and enough players were found among them to make up a scratch game, which was well enjoyed.

Next Saturday the return match with Clissold will be played on the home ground at Wormholt Farm, when friends of the club may see an interesting match.

MASON COLLEGE, BIRMINGHAM.—Professor Allbutt, Begos Professor of Physic in the University of Cambridge, presided at the annual dinner held at Birmingham on Saturday last, in celebration of the birthday of Sir Joseph Mason, the founder of Mason College. In proposing the toast of "The College," Professor Allbutt referred to the extended usefulness of the college, in having added since its foundation many students to its rolls. It was not merely an institution for imparting technical knowledge. If, in regard to brewing, for instance, they taught just so much chemistry as was useful, that would be technical training in its bad sense. The brewers had now found out—because some brewers or some chemists go into association with biologists—that the science of biology had a most remarkable and ultimate bearing on the industry of brewing. In those days things were taught in what he called the university spirit. A man learned biology or chemistry as science, and for its own sake, and taking the vulgar pecuniary reward only into consideration, enormous advantages had flown from the fact.

ROYAL INSTITUTION.—In his lecture on Tuesday, February 20, Professor Stewart dealt with the coral polypes or Anthocunya, so-called on account of the flower-like appearance which many of them present; they commonly secrete carbonate of calcium to form a supporting framework. The general structure of these polypes was exemplified by a description of the structure of a sea anemone. In this creature the body wall consists of ectoderm, mesogloea and endoderm; the mouth opens into the body cavity, which is partially divided into parablasts by a transverse septum. The calicle takes place either sexually by ova produced on the mesenteries or asexually by budding, fission or extension of the base with production of new anemones. The cells of the ectoderm secrete carbonate of calcium, together with a small quantity of organic matter, which, deposited on the rock, fills up all inanities and forms a base-plate. Upon the upper surface of this plate calcareous rays or septa are formed and develop into plate and form the theca, in the centre of which is a small column, the coluimella. The structure of the mushroom coral and the mode by which it is produced was fully discussed after which Professor Stewart passed on to notice Potillorea and Turbinaria.

THE RELATION OF ENERGY OF COMBINATION TO ELECTRICAL ENERGY.—The problem of directly converting the stored-up energy of coal into available electrical energy is one of great importance; and as a first attempt to perform this operation, the experiments made by Dr. W. Borches, of Duisburg, and which he described before the recent annual meeting of the Verein der chemische Gesellschaft, possess great interest. The author in the first place produced an electric current by the „combustion“ of carbonic oxide gas. The original form of the apparatus consisted of a glass vessel divided into three compartments by two glass plates which nearly reached to the bottom of the vessel. In the two exterior compartments copper tubes were placed, which served for the introduction of the carbonic oxide, while the middle compartment contained a bell-shaped mass of carbon. This carbon bell constituted one plate of the cell, and the oxygen was introduced by means of a tube within this bell. To electrize the author employed an acid solution of cuprous chloride; this liquid readily absorbs both oxygen and carbonic oxide, and is therefore particularly well suited to form the electrolyte in a gas battery in which these gases are used. Coal gas which contains 5 per cent. of carbonic oxide was, after the first experiments made in place of pure carbonic oxide. The copper tubes were weighted before and after each experiment, and no decrease in their weight was ever found. With such a cell working through an external resistance of 0·1 ohm a current of 0·5 amperes was obtained, while with an external resistance of 50 ohms the emergence of potential between the terminals was 0·4 volt.

With a cell in which the outer compartments were filled with copper turnings, in order to increase the
absorption of carbonic oxide by exposing a greater surface, and by using coal gas in place of pure carbonic oxide, a maximum current of 0.64 ampere was obtained, and by increasing the external resistance a maximum difference of potential of 0.68 volt was maintained. The E.M.F. obtained by calculation from the former was 0.67 volts. The combination of CO and O is 1:47 volts, so that in the above experiment 27 per cent. of the energy of combination of the fuel is converted into electrical energy. Since a solution of cuprous chloride dissolves hydrocarbons, powdered coal was tried in place of carbonic oxide, when a maximum current of 0.4 ampere and a maximum E.M.F. of 0.3 volt were obtained. The above E.M.F. (0.3 volt) corresponds to about 15 per cent. of the energy corresponding to the oxidation of carbon. In the case of the coal-dust, even when the liquid was kept in motion, there was always a considerable falling off in the current, while the pollution of the electrolyte by the coal would quite prevent its use. With the gases, however, there is no falling off of the E.M.F., and this pollution of the electrolyte does not occur.

Meetings of Societies.

ROYAL INSTITUTION OF GREAT BRITAIN.

There was an average attendance on the 22nd ult., when Professor A. Schuster lectured upon "Atmospheric Electricity." When this science was but in its infancy, it was noticed how the spark of a battery resembled thunder and lightning, and the idea soon became generally, although somewhat vaguely, accepted that a flash of lightning was only a form of electrical spark, whilst it was left for Franklin, who had long suspected that a thunder cloud was charged with electricity, to establish by experiment a complete parallelism between lightning and electricity. This work successfully accomplished in the year 1752, and on his researches are based the complete understanding we now have as to the various phenomena of atmospheric electricity. After briefly alluding to Franklin's and Faraday's work in connection with the subject, the question of the origin of the "lines of
force" was discussed, and Professor Schuster passed on to consider the various causes of de-electrification which are constantly going on. Important factors are fires; these discharge electricity constantly, and it was pointed out incidentally that factory chimneys and lightning rods are very effective of electricity, better even than the lightning rod which is fixed to the summit. Having pointed out that the theory sometimes put forward as to the disappearance of the "lines of force" by passing away from the air into space was untenable, the Professor showed that on rising in the air the "lines of force" at first become thinner, that is, at distances of 15,000 to 20,000 feet they end. Their disappearance, however, depends upon the condition of the atmosphere, as, in very fine weather they end at 12,000 feet. The fact that electrical effect in the atmosphere is dependent upon the moisture present is well established, but some observers have had an idea that it is influenced by solar radiation instead, and an instance was cited which showed that electrical effect in Germany was directly connected with a dust storm which occurred in Alexandria, the electrification not being shown before the storm.

As to dissipating the effect of lightning upon trees, statistics showed that forty-eight oak trees are struck to one beech tree, the ratio being dependent upon the amount of oilier matter contained. Some curious effects of lightning having been described, a series of photographs were shown illustrative of various types of flashes, and after briefly alluding to allant discharges, the Professor described the phenomenon known as Elmo's fire. This name is derived from St. Eranus, who was the patron saint of the Italian sailors. Its peculiarity is that it appears as either positive or negative, one condition being as probable as the other. The phenomenon is simply one of induction. The very locality in which this has been advanced to account for atmospheric electricity were briefly noted. Their name seems to be legion, as they number since 1763 more than a score, whilst the year 1884 alone produced five new theories! Of this number the rotation of the earth, direct radiation, heat and condensation may be mentioned, and an instance was given, where from personal observation electrical effect was shown to be due to the actual formation of cloud. Speaking of the aurora borealis, it was mentioned that it seems to be connected with cirrus clouds at low altitudes, and that the many spots in the sun have been sometimes attributed to the existence of many auroras. The lecture was profusely illustrated by experiments, all of which passed off without a hitch.

SHEFFIELD MICROSCOPICAL SOCIETY.

A general meeting of the above was held on Friday, Feb. 22, in the Rutland Institute, Dr. Hall, B.A., in the chair. There was a large attendance of members.

Mr. Winder, F.C.S., F.R.M.S., gave a practical demonstration on "Micro-Photography." He showed how by means of an ordinary camera and microscope perfect results might be obtained, especially with the low-power object glasses, without going to the expense of昂贵 power, more expensive. Mr. Winder submitted to the members, Mr. Winders obliquely illuminated photographs of marine diatoms and anatomical objects by means of the various artificial illuminations, such as magnesium ribbon, oxy-hydrogen limelight, etc. The plates were then developed and lanter slides taken from them. The best and readiest means for this were adopted by the demonstrator.

Dr. Hall said he had been so much impressed by Mr. Winder's demonstration and the comparative quickness and ease of the manipulation, that he was now fully determined to introduce micro-photography into the Sheffield School of Medicine, where he thought it would prove of great service both to students and lecturers.

Mr. J. Newton Coome spoke of the application of micro-photography to his own special subject, that of "Diatoms." He had been advised by men of experience to "let it alone," and considering the numerous failures he had had in using the higher power objectives, he certainly thought that life was far too short to go in for this class of work. He was now contesting himself with drawing the objects by the aid of the camera lucida.

Mr. Newson could sympathise with Mr. Coome in his remarks. He had himself experienced great difficulty in obtaining good results with the fresh-water diatoms, their structure was far too fine and transparent to get a clearly defined photograph. He doubted this might be overcome to some extent by using tinted glasses.

A hearty vote of thanks was then passed to Mr. Winder for his demonstration.

Poisoning Cases and Inquests.

Carbolic Acid.—At Sunderland, on Wednesday, February 20, a young lady named Mora Torna, died from the effects of carbolic acid self-administered.—St. James's Gazette.

Strychnine.—Mary Radford, aged 75, died on Saturday, February 16, at 14, Icknield Port Road, Birmingham, from the effects of strychnine contained in a packet of vermifuge-killing self-administered. Verdict: "Deceased committed suicide whilst temporarily insane."—Coroner also commented upon the ease with which these poisons could be obtained.—Birmingham Daily Post.

Strychnine.—Mrs. Crowe, of Crew's Hole, St. George, near Bristol, died on Wednesday, February 20, from the effects of strychnine contained in a packet of vermifuge, self-administered.—Bristol Times and Mirror.

Opium.—Frances Charlotte Hannah Muggard, aged 32, died on Wednesday, February 20, in King's College Hospital, London, from the effects of opium, self-administered. Verdict: "Suicide while temporarily insane."—Standard.

Cyanide of Potassium.—Blake J. Weatherhead, an under-servant, died on Monday, February 25, at Berwick, from the effects of cyanide of potassium, self-administered.—Daily Telegraph.

Laudanum.—George Clarke, aged 40, died at Bournmouth, on Saturday, February 23, from the effects of laudanum, taken to produce sleep. Verdict: "Deceased accidentally poisoned himself."—Daily Chronicle.

Laudanum. Edmund Hodgson, aged about 48, died on Saturday, February 23, in Sheffield, from the effects of an overdose of laudanum. Verdict: "Deceased died from an overdose of laudanum, administered by himself, but there was no evidence to show why he took it."—Sheffield Daily Telegraph.

Carbolic Acid.—Richard Whalley, aged 23, died on Monday, February 23, at Birkenhead, from the effects of carbolic acid, self-administered.—Liverpool Post.

Oil of Cloves.—Mrs. de Vere, wife of a Daltanton tailor, gave her little girl oil of cloves in mistake for some cough syrup. An emetic was administered, but too late. The baby died, and at the inquest held on Thursday, February 21, a verdict of misadventure was returned.—Star.

[The quotations here given are in all cases the lowest net cash prices for bulk quantities, and often the prices quoted are lower in order to suit the requirements of the pharmacists. It is important that this should be borne in mind in making any comparison between these prices and those of the wholesale drug trade.]

THURSDAY, FEBRUARY 28, 1895.

Since our last, the position of the Chemical Market has altered but little. A few changes only have occurred in the quotations, and they have for the most part been on the down line. Citric acid has not shown any marked change during the week, for although very steady at a fractional advance during the earlier part, it is at the close quoted at last week's rates. The position of tartaric acid remains unaltered. With regard to ammonia compounds, sulphate has been very steady at 14d., the week. After the quotations had been on the up line during the week, it closes very firm at a considerable advance. This advance has not, however, been accompanied by any change in the prices of carbonate of ammonia. Arsenic remains very firm at unaltered rates, this applying also to ales. As to borax, the tone of the market is very weak, and a slight reduction in the prices of both powder and crystals has been made. The demand for sulphate of copper remains very brisk; powdered rates. Cream of tartar has been steady throughout the week, and closes firm at last week's top quotations. Mercurials and quicksilver are unaltered. The market in potash compounds is very quiet, prices moving slowly at a fractional reduction; whilst chlorate, which earlier in the week saw still lower quotations, closes at last week's bottom prices. Soda compounds are unaltered. Details:

ACID BORATIC.—Last week's prices still hold. Crystals quoted at 8s. 9d.; powdered, 22s.

ACID CITRIC.—At the commencement of the week a very steady demand was shown, with tendency to advance. At the close, however, it is offered at last week's rates of 1s. 1d. to 1s. 3d.

ACID OXALIC.—In steady demand at unaltered rates. Manufacturers still quote 2d. as rails.

ACID TARTRIC.—No improvement is to be recorded, as the market remains very quiet, and not much business passes at the quoted rates. Ethyllic manufacturers still quote at 10d. to 11d. ; foreign ditto, 10½d.; powder, 10½d.

AMMONIA SALTS.—Sulphate: The market has been very firm and continually on the rise during the week. At the close it is very steady. Granulated cent. is now returned at 2s. 7d. 6d. Carbonate: The advance in sulphate has not been accompanied by any change here, last week's quotations of 8½d. to 8¾d. being unaltered. See Ammoniac: Last week's rates are unaltered. First are still returned at 36s.; seconds at 57s.

ASHER.—Though very steady, the last quotations still hold. American is worth 40s., with pots at 28s.

ASHERIC.—The market remains very firm, the supplies are plenty at 14s. 6d. to 14s. 9d.

BLEACHING POWDERS.—Not much doing, but the prices are well maintained. Quotations, 8s. 6d. to 8s. 9d.

BORAX.—Very weak market. As was to be expected last week, the prices are now somewhat reduced, and it is now being quoted at 10½d. for crystals, and 20s. 6d. powdered.

CREAM OF TARTAR.—Has remained very steady during the week, the closing prices indicate an improving market. White crystals are now returned at 19s. 5½d., with powdered at 60s. 6d.

MERCURIALS.—Unaltered. Quantities up to 30 lbs. are still quoted: Calomel, 2s. 9d.; red precipitate, 2s.; white precipitate, 2s. 3½d.

POTASH COMPOUNDS.—Weak market generally. Prussiate very easy at a fractional fall, now quoted at 4d. Chlorate has again fluctuated, but always falling. It touched 4½d. earlier in the week, but closes at 4½d. Dichromate remains unchanged at 4½d. to 4½d.

QUICKSILVER.—Quiet, with unchanged quotations. Importers' prices are still £2 10s., and in second hands the rates are £2 6s. 6d. to £2 11s. 6d.

SODA COMPOUNDS.—Quiet and unchanged. Caustic Soda remains easy at £3 for 70 per cent., with £2 less for 50 per cent. Chlorate unchanged at 5s. Bicarbonate remains at 27s. (London).

THE DRUG MARKET.

ALORS.—Quiet, but quotations are well maintained. Cose is worth about 23s. 6d. for good hard bright to fine; whilst the coarse drossy qualities are selling at 18s.

BUCHU.—Short leaves sold at the last auction at somewhat higher prices, the quotation being 9½d. for green and 9½d. for yellow. Not much demand for long leaves, which are worth 8½d. to 4d. for fair qualities.

CAMPHOR.—The market remains very firm. It is now quoted at 10½s. c.s.f. The prices for the English refined article are now 1s. 6d. for bells and 1s. 7d. for squares in quantities of half a ton.

CARCARIANA.—Not much doing, but good quality bark would command a good price.

GUAJACIN.—Very quiet, but quotations being 18s., with a likelihood to advance, as the impure article is somewhat scarce.

COCHINCEL.—The market is very firm, and no sales are reported. Black is worth 2s. 4d.

COLOCYNTH.—In good demand, the prices indicating an advance on those of the last sales. Good pale balls of Turkey are now quoted at 1s. 8d.

HUMY.—Very steady. Fair Californian is worth 2s. 6d. with decales Jamsen, 4s. 10d.

IPSAC.—Very firm. Fine annealed BIO root is worth 5s. 2d., whilst Carthagena is in improved demand. Sales of first-class root being reported at 8s. 10d., with seconds at 7½s.

JALAP.—In fair demand. A sale of ten bales of Fair Vera Cruz at 1s. 6d. is reported.

MENTHOL.—Very firm. It is now quoted at 14s. 6d. January delivery. Spot quotations have also advanced, 15s. 6d. to 16s., being the future.

MORPHIA.—Remains unchanged at 5s.

OILS (Essential).—Eucalyptus is in very strong demand, and business has been brisk at greatly increased rates. Sales of the Globulus oil (Platypus brand) are reported at prices ranging from 2s. 6d. to 2s. 9d., indicating an advance of 6d. Cumming's Oleosa oil is quoted at 2s. 9d., and the native bear brand at 2s. For other qualities 2s. 9d. to 1s. 6d. is paid for grades which last week only commanded 10d. to 1½d. This increased demand is, of course, attributable to the prevalence of influenza, and prices will probably reach higher figures. Ammonia oil is somewhat easier; 5s. 6d. has been accepted during the week, but 5s. 11d. would more represent a fair quotation. Peppermint: The Japanese oil is dearer. 40 per cent. oil is quoted at 2s. 6d. to 3s. 6d. on the spot, with deminemilled oil at 6s. 9d. to 7s. H. G. Peppermint oil is quoted at 8s. 9d. to 10s., and Cassia at 4s. to 4s. 6d.

OILS (fixed) AND SPIRITS.—Castor Oil.—In dull demand. Forty cases of second quality Calcutta oil were sold at the auctions, the rate being 3s. 6d. Cold-joever oil.—In very steady demand, the prices tending higher. The closing quotations for new seasons oil are now 19s. at Bergen. Spot quotations for prime 1894 oil are 17½s., for finest non-coagulating new oil, 21½s. Fusch kernel oil: Last week's quotations are maintained, the prices for half-ton quantities still being 8d. Linseed: Has been continually on the down line, the prices showing a reduction of about 1½s. 6d. Closing rates for 20s. 7½d. to 20s. 9½d. seem certain; Remains steady in quiet demand at last week's rates. Refined oil is still quoted at 17s. 7½d. to 18s. 6d., according to brand. Coconut: Rather easy. Ceylon: Is worth £2 8½d. to £2 10s. each 25. Rice: Fairly steady. Refined oil is quoted at £2 15s. to £2 23s. Turpentine is very firm, with steady increase in prices. American spirit is now worth 22s. 6d., which shows an advance of 3d. to 6d. on last week's rates. Petroleum: The last quotations have not been maintained, although earlier in the week it touched
5d. Since, however, it has been continually easier, the closing quotations for the American oil being 44d., and for the Russian 44d. Petroleum spirit : Ordinary 7d., deodorised, 7d. to 7½d.

Olive.—No change of importance has occurred during the week, and last week’s quotations remain unchanged. The stocks in both London and Smyrna are, however, very low, and should the weather in the opium-growing districts turn out unfavourable prices will be considerably raised. Quotations.—Turkey : Soft shipping description, 13s. to 15s. 6d.; best “dragonville,” 10s. to 10s. 6d.; seconds ditto, 9s. to 9s. 6d. Persian : 11s. 9d. to 12s.

QUININE SULPHATE.—During the past week business in this metal makes a great improvement. There have been some sales earlier at 11½d., but at the close last night is the quotation with little doing at that figure. Selling.—In much better demand. 1s. 5d. is now readily paid, whilst 1s. 6d. is now asked for good bright quality root.

SHELLAC.—There is little business doing. Some small sales of T.N. orange are reported at 11s. At the Auctions, on the 26th, there was but a small supply, no Garnet being offered, and Second Orange meeting with but poor demand. Of 315 cases offered 118 sold. Second Orange was worth 105s. to 107s. Fair A.C. Garnet has since been selling at 108s. New.—Very steady. At the last sales Hindustan good quality fetched 1s. 6d., with fair mixed Jamaca, 1s. 5d., and native damaged at 7d.

WAX (Bees).—Is very steady at increased prices. Good pale Jamaica wax is worth £3 7s. 6d. to £3 10s. 6d.

Obituary.

RICHARD PARKINSON.

We regret to have to record the death on February 21 of Richard Parkinson, Chemist and Druggist of Liverpool, aged 66 years. Mr. Parkinson was for many years associated with the Society, in whose work he manifested considerable interest. From 1889 he acted as the Society’s representative in Liverpool, and only retired in October last from a sense of failing energies. During his fifty years’ residence in Liverpool Mr. Parkinson did much good work in his quiet unassuming way, and his co-workers in the various local educational and religious movements with which he was identified will keenly feel his loss. He was also treasurer of the Liverpool Chemists’ Association. Graceful tribute to the excellent qualities of the deceased and to the high place he held in the esteem of his fellow-citizens was publically rendered by the Rev. W. J. Adams, of St. Augustine’s Church, in the course of a memorial sermon. Among those present at the interment at Everton were Mr. J. Smith (the Society’s present local secretary), A. T. Buck (assistant local secretary), and many other fellow-craftsmen.

Notice has also been received of the death of the following:—

On February 5, Joseph Brown, Chemist and Druggist, Brownlow Hill, Liverpool. (Aged 47.)

On February 11, Nathan M. Green, Chemist and Druggist. Lindsey. (Aged 45.)

On February 16, W. S. Edwards, Pharmaceutical Chemist, Great Dover Street, London. (Aged 84.) Mr. Edwards had been a member of the Pharmaceutical Society since 1853.

On February 21, William E. Lowe, Pharmaceutical Chemist, London. (Aged 73.) Mr. Lowe had been a member of the Pharmaceutical Society since 1853.

On February 22, R. C. Pars, Chemist and Druggist, Thrapston. (Aged 59.) Mr. Pars had been a member of the Pharmaceutical Society since 1843.

On February 24, William Geddes, Chemist and Druggist, Oldham. (Aged 67.)

Personal and Trade Notes.

In view of the approaching revision of the British Pharmacopoeia, Messrs. Heilbo and Passmore, 58, Queen Victoria Street, E.C., have published a pamphlet containing suggestions as to what the official requirements for essential oils should be.

By a compositor’s blunder, the address of Messrs. Llewellyn and James, makers of Morris and Wetherall’s patent stills, was printed last week as Halifax instead of Bristol.

A trial of “Volora” tea for invalids, supplied by the United Kingdom Tea Company, Ltd., Mining Lane, E.C., confirms the statement that it is remarkable, free from The infusion is devoid of astrigency, and possesses a delicate flavour which will be appreciated by the teadrinker whose palate has not been spoiled by the numerous beverages too frequently supplied.

At the eighteenth ordinary general meeting of the Sanitas Company, Limited, on February 26, a dividend of 1½ per cent, was declared, and an informal expression of opinion was given in favour of the issue of more capital.

A modern pharmacy has been fitted for Mr. Ellis Jones, Kingwood, Bristol, a leading feature being an elaborate dispensing screen. The work has been carried out by Messrs. Vale Brothers, Weston-super-Mare.

The Committee of the Sheffield Trades and Industrial Exhibition, Drill Hall, Sheffield, has been pleased to award the gold medal for excellence of aerated waters & syrups to Mr. J. F. Eardley, pharmaceutical chemist and mineral water manufacturer, Glossop Road, Sheffield.

A dividend of 10 per cent. has been declared by the Briton Fern Chemical and Manure Company, Ltd.

Patent Specifications.

PUBLISHED DURING FEBRUARY.

Sodium or potassium cyanide (A. E. Hetherington and E. K. Muspratt). In the case of sodium cyanide, a hydrous sodium, ferrocyanide is fused with an alloy of lead and soda prepared as described in specification No. 5813 of 1894 (see last week’s Journal). The alloy is first melted under a covering of sodium cyanide to prevent oxidation, and the ferrocyanide is added in small portions at intervals. The sodium cyanide produced by the action forms a saleable product and lead is fused into the alloy. Potassium cyanide is similarly prepared. No. 5893 of 1894.

Spectacles (J. Rintoul).—The portions which rest upon or clasp the nose are made of india-rubber tubing or leather, preferably closed at the ends and finished with silk. No. 6127 of 1894.

Trusses, etc. (F. T. Simmonds).—Abdominal supports are trusses fitted over the entire inner surface of the spine with a pneumatic cushion inflated through a screw-valve as usual. No. 16,086 of 1894.

Hydrochloric and hydrobromic acids. (R. O. Loomis).—The chlorine obtained as a by-product in the electrolytic production of metals, etc., is converted into hydrochloric acid by passing it in admixture with steam through a clay retort filled with charcoal, coal, or coke, and heated to dull redness. The reactions which occur are said to be as follows:—

\[ C + H_2O + Cl_2 \rightarrow 2HCl + CO \]
\[ C + 2H_2O + 2Cl_2 \rightarrow 4HCl + O_2 \]

Hydrobromic acid is similarly prepared. No. 25,073 of 1894.

Electrolytic reduction of metals (T. C. Oliver).—The mineral or compound to be reduced is first fused in an electric furnace, and is then charged with positive electricity and passed over a solid metal surface charged with negative electricity. The metal deposits on the negatively charged surface and the waste material passes away as slag. No. 29,068 of 1894.
New Companies Registered.

[Compiled from the Financial News.]

AEROSCOPIC LENSES COMPANY, LIMITED.—Registered by J. E. Purchase, 11, Queen Victoria Street, E.C., with a capital of £25,000 in 2,500 shares. Object, to carry on business as manufacturers of and dealers in electrical, medical, and optical instruments; as advertisement agents, printers, etc., in all their respective branches. Registered without articles of association.

PASTEUR ANTHRAX VACCINE (UNITED STATES AND CANADA) COMPANY, LIMITED.—Registered by Benahaw, Keswick and Smith, 2, Suffolk Lane, E.C., with a capital of £5,000 in 2,001 shares. Object, to adopt and carry into effect an agreement, made January 18, 1886, between this company and the one part, and H. Sorby of the other part, and to propagate the Pasteurian methods of vaccination. The first directors—to be not less than three nor more than seven—are to be elected by the signatories. Qualification, £100. Remuneration, £200 each per annum, and a percentage of the profits, divisible.

ANGLO-HUNGARIAN AND TRANSylvANIAN COMPANY, LIMITED.—Registered by Saunders, Hawkford, and Bennett, 55, Coleman Street, E.C., with a capital of £100,000 in 20,000 shares. Object, to adopt and carry into effect an agreement, made February 5, 1886, between the said company and Mr. E. Worthington Pullin, on behalf of himself and the other party; to acquire any properties, concessions, options, undertakings, and businesses in Hungary, and on carrying on mining, exploring, and trading operations in Hungary or elsewhere; as engineers, chemical manufacturers, oil refiners, planters, exporters, merchants; all kinds of agency business; to construct and maintain rail and tram lines, harbours, wharves, piers, docks, etc. The first signatories were—

E. J. Wright, 18, Limo Street, E.C. 1
A. W. Arup, Brooklands, South Benfleet, Essex 1
H. J. Ork, Leadhall House, E.C. 1
J. Atkins, 14, Exchange Road, Harringay 1
M. H. Haswell, 114, Stavemor Road, Clapton 1
O. H. Bennett, 92, Victoria Street 1
H. B. E. Powell 1

The first directors—to be not less than two nor more than ten—are to be nominated by the signatories to the memorandum. Qualification, 100 shares. Remuneration, £100 each per annum and a percentage of the profits, divisible. Registered office: 53, Coleman Street, L.C.

UNIVERSAL GAS LIGHT AND FUEL SYNDICATE, LIMITED.—Registered by Dollman and Pritchard, 30, King Street, I.C., with a capital of £200,000 in 20,000 shares. Object, to carry on business as colliery proprietors, gas manufacturers and supplyers, iron and steel manufacturers, chemical manufacturers, steel founders, ironfounders, etc. The net directors—to be not less than three nor more than five—are to be nominated by the signatories. Qualification, 1 share. Remuneration to be fixed by the company. Registered office: 7, George Yard, Lombard Street, E.C.

NITROGEN COMPANY, LIMITED.—Registered by W. E. Stone, Billiter Square Buildings, E.C., with a capital of £20,000 in 2,000 shares. Object, to adopt and carry into effect an agreement, made February 15, 1886, between H. Wiskeman of the first part, F. J. Knight and F. Walters of the second part, and V. A. Richards, on half of this company, of the third part, and, generally, carry on business as manufacturers of nitrogen.

New Books and New Editions.

[Compiled from the Financial News.] New and Improved devices for taking stereoscopic photographs of still life with a single camera and lens. February 8, 1886.

No. 2785.—James Ashford, 512, Aston Road, Birmingham.—Improvements in hand cameras. February 7, 1886.

No. 2715.—Arthur Argent Ather, 55, Chancery Lane, London.—Improvements in or relating to flash lamps used for photographic or other purposes. February 7, 1886.

No. 2747.—Reginald Blackwell Bridgbach, 151, Strand, London.—Improvements in and relating to perfumes, vapoourisers and the like. February 7, 1886.

No. 2726.—Edward Anthony Ide, 5, Howard Street, Gloucester.—A new method for taking stereoscopic photographs of still life with a single camera and lens. February 8, 1886.

No. 2725.—Ronald Gale, Porth House, Chestnut Grove, New Malden, Surrey.—Improved air-tight snow cap for bottles, flasks, jars, oil cans, and kegs of every description. February 8, 1886.

No. 2735.—John Alderson Clarkson, 54, Fleet Street, London.—Improved device for freezing liquids of different densities. February 9, 1886.
Diary of the Week.

[Notices for insertion under this heading should reach the Editor on or before Wednesday.]

SUNDAY, MARCH 3.
Sunday Lecture Society, at 6 p.m. "Plants and their Insect Visitors" (Illustrated), by C. W. Kimmins.

MONDAY, MARCH 4.

TUESDAY, MARCH 5.

WEDNESDAY, MARCH 6.

THURSDAY, MARCH 7.

Liverpool Pharmaceutical Students' Society, at 8.30 p.m. Exhibition of Lantern Slides by Messrs. J. R. Burn, J. Jones, R. B. Mitchell, J. Penketh, Geo. E. Tharles, and H. Wyatt, junr.

Glasshouse and Waterworks of Scotland Pharmaceutical Association, at 9.15 p.m.

The Anatomy of Expression," by Dr. T. H. Bryce.

FRIDAY, MARCH 8.

SATURDAY, MARCH 9.
Royal Institution of Great Britain, at 8 p.m. "Waves and Vibrations" (Second Lecture), by Lord Rayleigh. Sheffield Microscopical Society, at 8.30 p.m. "Modern Microscopy," by J. N. Coombe. Pharmaceutical Football Club v. Gilead at Wensnall Farm, Shepherd's Bush, Commence at 3.15 p.m.

Trade Marks Applied For.
[Compiled from the Trade Marks Journal.]

185,500.—YOGUR.—Device of a girl standing in a V. All goods included in Class 8.—MacKenzie Drug Company, 9, Crewe Road, Thornton Heath, London, S.R. November 12, 1894. The essential particular is the device.

184,466.—REIDENTALIUM, and other wording on an oblong label. A medicine for human use, for the relief of toothache and arrest of decay of the teeth.—Charles Harry King, 14, Fenchurch Street, London, E.C. December 31, 1894. The essential particular is the word "Reidentaliun.

184,680.—Device of a balloon and name and address of applicants on a black and white label. Chemical substance prepared for toilet purposes.—The Gas Light and Coke Company, Bickton, London, E. December 31, 1894.

184,581.—RENFIN.—Device of balloon and wording on a black and white label. Bensein (included in Class 6) for cleaning purposes.—The Gas Light and Coke Company, Bickton, London, E. December 31, 1894. The essential particular is the combination of devices.

184,592.—FUTERIC TAPLERS.—Device of man in armor and crown on shield. Tablons, being medicines for human use.—Watson and Watts, 96, Leadenhall Street, London, E.C. November 8, 1894. The essential particular is the device.

184,001.—Device of cross keys, with the words one key brand. Chemical substances prepared for use in medicine and pharmacy, but not including sugar of milk, and not including any goods of a like kind of sugar of milk.—Hodgson and Simpson, Calder St. Works, Wakefield, Yorkshire. November 20, 1894. The essential particular is the device.

Notices to Contributors.

* * * Communications should reach the Editorial Department, 17, Bloomsbury Square, W.C., not later than the first post on Wednesday, if publication is desired in the next issue of the Journal; though prompt publication cannot always be guaranteed.

Matter intended for publication must be written in ink, on one side of the paper only, and be authenticated by the name and address of the writer; not necessarily for publication, but as a guarantee of good faith.

No notice can be taken of anonymous communications, and contributors are requested, as far as possible, to append their proper signatures rather than pseudonyms, a greater value being thus given to any opinion expressed.

To ensure accuracy, all chemical formulas, and scientific and proper names, should be written or printed with extra care; whereas if names of plants and animals are underlined, and generic names also commenced with capital letters, much inconvenience will be obviated.

Where illustrations are necessary, pen and ink drawings consisting entirely of clean and sharp lines—and, preferably, twice the required size—must be supplied not later than a week before the proposed date of publication.
Notes.

Evening Meeting in London.—At the evening meeting of the Pharmaceutical Society at 17, Bloomsbury Square, W.C., on Wednesday next, a paper will be read by Mr. R. A. Cripps, entitled "Standardised Preparations of Belladonna," and Mr. J. C. Umney will contribute one, on "Empireum succussion." The chair will be taken by the President at 8 p.m.

Annual Dinner of the Pharmaceutical Society.—The preliminary arrangements in connection with this dinner will be made at a meeting to be held on Wednesday next, at 17, Bloomsbury Square, at 11.30 a.m., when the President will take the chair.

Brixton and Clapham Camera Club.—This is one of the most flourishing of the suburban photographic societies, and its fifth annual exhibition will be held at Brixton Hall, Acre Lane, S.W., from 26th to 30th Inst. Owling to the success attending this exhibition during the last two years, it has been now decided to add two open classes for prints and lantern slides, and eastern entertainments will be provided each evening. The president of this society is Dr. Reynolds, F.R.G.S., and local pharmacy is well represented amongst its members. Mr. F. W. Levett, of 11, Corrance Road, Acre Lane, is the hon. sec.

British Institute of Preventive Medicine.—Dr. Armand Ruffer has tendered his resignation as Director of the British Institute of Preventive Medicine.

Trade in the Far East.—In order to foster and facilitate British trade with the important and growing market of Japan, the proprietors of the British Trade Journal have decided to issue an edition of their journal in the Japanese language. The present idea is to issue it quarterly, and a representative of the journal is leaving for Yokohama to make the necessary arrangements. During his journey he will communicate to our contemporary a series of letters from various commercial centres in the Far East, particular attention being given to the trading possibilities of Japan after the war. It is to be hoped that information respecting the drug trade will be included, as in these times of commercial depression it is more important than ever that fresh channels of trade should be opened and developed.

Ultra-Violet Photographic Spectrum.—According to Nature, Dr. Schumann has now improved his plates and "vacuum spectrograph" so as to obtain satisfactory representations of the ultra-violet spectrum in a few minutes. The spectra of cobalt, iron, aluminium, zinc, and cadmium have been considerably extended beyond 1700Mm., and the hydrogen spectrum also shows a further lengthening.

Chemists' Assistants' Association.—The seventeenth annual dinner of this Association was held on Thursday, at the Cannon Street Hotel, the chair being taken on the occasion by Mr. Walter Hills, member of the Pharmaceutical Council.

Underground Explosions in London.—A curious effect of electrolytic action in connection with the St. Pancras electric lighting mains, which rest on porcelain or stoneware insulators, is the formation of a certain amount of metallic sodium. This occurs in an incrustation composed mainly of copper oxides and castic soda, and it is supposed (see p. 88) that some of the recent underground explosions may have been caused by the metal coming in contact with water, and so igniting the mixture of illuminating gas and air present in the water-tight culverts.

Sterilisation of Water.—The Paris correspondent of the Lancet states that M. Frémont has proved that, by maintaining water at a temperature of 80°C. for twenty minutes, all the pathogenic microbes it may have contained will be destroyed, without any loss of the gaseous or saline contents of the water, and without modification of its flavour.

Liqufaction of Gases.—Professor Dewar, in last week's Nature, again repeals Mr. Pattison Muir's attack, and shows the weakness of the charges brought against him by the latter. He also protests against Mr. Muir's interference in the matter.

New Metric Standards.—The President of the Royal Society, accompanied by several members of the Council, visited the Standards Department of the Board of Trade on February 21, and inspected some new metric standards. These included a "line" standard metre measure (mètre-à-linches), a kilogramme weight, and an "end" standard metre (mètre-à-bouts). The measures are made of platinum, alloyed with 10 per cent. of iridium, and the "line" metre has been verified to one part in a million (±0.1 μ), whilst the "end" metre has a probable error of ±0.3 μ. The kilogramme is a cylinder of the same iridio-platinum alloy, the height and diameter of which are equal (59 Mm.), and has been verified with a probable accuracy of 0.002 part in a million.

London County Council.—Amongst the successful candidates at the recent election for membership of this body, are Major Clifford Probyn, J.P., who heads the poll in the Strand division, and Mr. T. H. W. Idris, who occupies a similarly honourable position in North St. Pancras. In both cases the member is re-elected.

Plant Houses at Kew.—It is reported that experiments in substituting white glass for green in the plant houses at Kew Gardens have proved so successful—the improvement in the growth of the plants being very marked—that it is now intended to abandon the use of green glass entirely in future.

Liverpool Chemists' Association.—The members of this Association hold their annual dinner at the Adelphi Hotel, Liverpool, on Tuesday, March 12, at 7.15 p.m. Applications for tickets should be addressed to the honorary secretary, Mr. A. S. Buck, 179, Bedford Street, Liverpool.
**Miscellaneous News.**

[Readers are invited to send local information of pharmaceutical interest. When newspapers are sent the paragraphs to be noted should be plainly marked, whilst cuttings should be verified by the addition of source and date.]

---

**Beecham v. Hargrave and Sanders.**—In the Chancery Division on March 1, before Mr. Justice North, Mr. Eve, who appeared for Messrs. Beecham, asked for an injunction to restrain Messrs. Hargrave and Sanders, chemists and druggists, carrying on business at No. 1, Booth Street, Halme, Manchester, and also their servants, from selling or offering for sale as Beecham's pills any pills not of the plaintiff's manufacture. The learned counsel said that the motion was not opposed, but the defendants, who appeared by his friend, Mr. Martelli, were willing to submit to a perpetual injunction in the terms of the notice of motion, and to pay an agreed sum for damages and costs. His lordship granted the injunction as a consent order accordingly. — *Morning Advertiser.*

---

**Poisoning by Marasmines.**—A fearful retribution has overtaken some post-office clerks at Tarbes, in the department of the Gers, who, under the delusion of opening a parcel passing through their office and stealing some cakes out of it. The cakes were of the kind called "marasmines," and they seem to have been shared out equally by four men on duty. Directly they tasted them three of the clerks felt a burning sensation in the throat. They were given a very little of the food therefore, and they went and rinsed out their mouths with cold water. The fourth man, remarking that his share was "not so bad," ate the whole of it. Soon after he went home his hands and feet became icy cold, and he had fearful internal pains. He fell heavily on the floor, and was taken up in a dying state. The others did not suffer so severely. Inquiries which have been made resulted in the discovery that the cakes had had strychnine placed in them, and were addressed to a M. Cabarro at Clermont, near Bagneres de Bigorre, by a young usher in a school named Contre, who owed him a grudge. Contre, on being arrested, made a full confession. — *Daily News.*

---

**Mysterious Death from Poisoning.**—A mysterious case of death from poisoning engaged the attention of a coroner's jury at Brighton on Saturday, March 2. The deceased was Mary Elisabeth Leclerc, of 159, London Road, the wife of a teacher of languages and painting, who described himself as a descendant of a family of Spanish grandees. She was sixty years old, and the husband appeared to be about half that age. On Friday morning, when he went to his wife's bedroom, he found her lying on the bed fully dressed, and dead. Whichever came in the room found her to be still in bed with influenza, Mr. Leclerc at once ran for a doctor. When the medical man, Mr. Tocher, arrived, he found that Mrs. Leclerc had been dead for several hours, and under one of her arms he discovered a small bottle containing a dark-coloured fluid. What that fluid was, however, he was unable to determine, though he described himself as a chemist of some experience. On making a post-mortem examination he satisfied himself that death had arisen from some corrosive poison of an exceedingly powerful nature, the stomach being, as he put it, reduced to a jelly. His opinion was that the fluid in the bottle found on the deceased was a corrosive poison, and was consequently not the poison that had caused death; and the foreman of the jury, a chemist, shared that belief. A search at the premises had, however, failed to reveal any trace of a corrosive poison. Deceased, it transpired, had married Mr. Leclerc about eighteen months ago, and had made a marriage settlement upon him. One of the jury said he had always regarded Mrs. Leclerc as a very nice woman, and that the deceased, as well as a charwoman who worked at the house periodically, said that she was subject to delusions. Her delusions were that she heard voices; and her jealousy of the servant in connection with her husband was attributed by the witnesses to insanity of mind. The servant represented that she had had to endure much from her mistress, and both she and the charwoman said that deceased had threatened to commit suicide. Indeed, on one occasion the charwoman had taken from Mrs. Leclerc a knife with which she had threatened to take her life. After a long inquiry it was decided that Mr. Tocher should make a further investigation with another medical man, and, if the poisoning still remained a mystery, the stomach and the bottle of unknown fluid should be submitted to the Government analyst. With this object in view, the inquiry was adjourned till Monday, March 11. — *Daily News.*

---

**Street Explosions in London.**—In a letter addressed by the Board of Trade to the Chairman of the Electric Lighting Committee of the St. Pancras Vestry, it is stated that Major Cardew, the electrical adviser of the department, has discovered, in his investigations into the recent explosions in the street boxes used for electrical supply in St. Pancras, that a remarkable deposit on some of the insulators contained a considerable quantity of the metal sodium. It is pointed out that "the presence of this metal, which is highly inflammable by contact with water, appears to be so grave a source of danger, and is so difficult to account for in connexion with the accumulation of escaped current that it is thought to be due to several explosions which have recently occurred, that it involves the Board of Trade, without any delay whatever, to investigate the causes of the deposit of this substance, with a view to its prevention, and in this investigation they have asked for the assistance of the Royal Society and of the Institute of Electrical Engineers. In the meantime, in order to prevent as far as possible the recurrence of similar explosions, the Board of Trade would strongly urge that the Vestry, through their Electrical Committee, should immediately (1) provide a thorough system of ventilation for their own boxes; (2) make as far as possible the space in their street boxes within which an accumulation of gas can occur; (3) make a thorough inspection of their mains, and remove the above-mentioned deposit wherever it is found to exist."

---

**Tartaric Acid for Sodium Sulphate.**—In the Queen's Bench Division, on March 5, the case of Risley v. Mylne was heard. This was an action brought by Mr. George Blyton, an engineEH employed by the North London Railway Company, against the defendants, Messrs. Townsend and Meson, who carry on business in Bishopsgate Street, E.C., to recover damages for injuries which, he alleged, he sustained through their negligently supplying him with tartaric acid instead of sodium sulphate. There was no defence to the action, as the defendants admitted that a mistake had been made, and that the plaintiff had been supplied with tartaric acid instead of sodium sulphate, and the case came before the court. On the 3rd of March, deceased was declared to be insane, and the court now ordered that the judgment made in June last the plaintiff, who suffered from attacks of gout, sent round to the defendants, with whom he was in the habit of dealing, for sodium sulphate, and when he got home from business, he,
having had it mixed by his wife, swallowed it. Directly after he had swallowed it he found that something was wrong. He began to vomit immediately, and he became so ill that he had to keep his bed for some days. He alleged that the tartaric acid had affected his eyesight and memory. In cross-examination the plaintiff said that he had never suffered from inflammation of the eyes caused through gout. He had been laid up with gout, but never for more than two days at a time. At the conclusion of the evidence, the jury awarded the plaintiff £20 damages. As Mr. Justice Cave had left the court when the jury announced their decision, the way in which judgment should be entered was postponed. — Standard.

**DRUGGING HORSES IN LINCOLNSHIRE.** At the Horncastle Petty Sessions on Saturday, March 2, Walter Spinkles, of New York, in the parish of Coningsby, was summoned for administering poisonous drugs to three horses, the property of Messrs. Sinclair and Son, seed merchants, etc. —The defendant, who pleaded guilty to giving the horses a teaspoonful of black (?) copperas twice a week, was fined £1 10s., and £1 11s. costs, and in default of payment one month’s imprisonment without hard labour. —Nottingham Guardian.

**ANTITOXIN AND DIPHTHERIA.** At the ordinary monthly meeting of the Nambour and Blain District Council, Dr. H. C. Bevan, the medical officer reported an outbreak of diphtheria, and stated that two cases had been fatal. The new remedy antitoxin had been used with great success, but not as a preventative owing to the difficulty of obtaining it. General approval was expressed at the action of the medical officer in introducing the new remedy, and it was decided to write him an official letter expressing the Council's appreciation of his experiments.

**PLYMOUTH, DEVONPORT, STONEHOUSE, AND DISTRICT CHEMISTS' ASSOCIATION.** At the usual monthly committee meeting held on March 5, at the Octagon, Plymouth, the following prize scheme was adopted:— Three prizes for practical analytical chemistry, value 10s., 6s. 6d., 3s. 6d., which Dr. Dunn, of the Technical School, is to conduct; two prizes, value 21s. 10s. 6d., for best report of work to be collected from April to September; also three prizes, value 10s., 6s. 6d., 3s. 6d., for an elementary botanical examination (the latter given by the President), the whole of which are to be competed for by unqualified members of the junior section only. Mr. John de Ternay also intimated that he would be pleased to conduct a class in materia medica monthly for the benefit of the junior section, which was cheerfully accepted. Dr. Dunn was also elected an honorary member of the Association.

**WEIGHTS AND MEASURES.** The Select Committee of the House of Commons continued on Tuesday the evidence of Mr. Chaney, of the Standards Department of the Board of Trade. With regard to anomolies still remaining in the markets of the country by custom as distinguished from law, he agreed with the General Secretary that the butcher's stone weight of 6 lb. is used only between the butcher and the wholesale purchaser, but not in the retail trade. Scotch and Irish miles were not yet obsolete, but the milestones on the roads were in imperial miles. The Board of Trade was empowered to authorise metric weights and measures for manufacturing purposes, but not for retailers. The earliest recorded pound was divided into 16 ozs. The English foot had always been divided into twelve parts. Where measures which have become illegal remained in use, the local authority had power, if it thought fit to exercise it, to interfere. The United States took over the English weights and measures across the Atlantic with the language, and still adhered to the yard measure, the Troy pound, and the Winchester bushel as representing units. In England the avoirdupois pound was the unit. The total number of weights and measures rejected as unfit to be stamped were 846,467, while £3,500 were returned by the inspectors to the owners to be readjusted. —Mr. Dowsen, C.B., chairman of the Executive Committee of the New Decimal Association, attended to explain his views on the system of weights and measures at present in vogue in this country compared with the metric system. The latter system, he said, is now in use in every country in Europe, except Great Britain and Russia and possibly Denmark, and is accepted by 445,000,000 of population. British traders were thus placed at serious disadvantage. —Daily News.

**SOCIETY OF CHEMICAL INDUSTRY.** At a meeting of the Yorkshire section of the Society of Chemical Industry, held on March 4 at the Queen's Hotel, Leeds, Messrs. Carlton, B. Heal, and H. R. Procter, F.I.C., read communications from the Leather Industries' Laboratory of the Yorkshire College on the analysis of liquors used in chrome tannage. After describing several faulty and abortive attempts to produce leather by the leather of condemned (including the Helmsley) process used by the Yorkshire Tanning Company), the American process of Schults and Zahm was explained, by which enormous quantities of glue, kid and other light leathers are now produced. After mentioning the practical difficulties which arise in carrying out this process, methods of analysis were described by which the course of tannage could be controlled, and considerable economies in bichromate effected. A number of samples of chrome leathers, both of American manufacture, and produced at the Yorkshire College, were exhibited. There was a fairly good attendance of members and their friends. Prior to the meeting of the Provisional Reception Committee discussed, but did not definitely decide upon, arrangements for the forthcoming annual meeting of the Society in the summer, at Leeds. —Yorkshire Daily Post.

**EDINBURGH ROYAL INFIRMARY DISPENSARY.** At the weekly meeting of the Edinburgh Royal Infirmary Managers on Monday, February 18, Mr. Thomas Alexander, chemist and druggist, at present Registrar, was, on the recommendation of the House Committee, unanimously elected chief dispenser in room of the late Mr. Charles Arthur, at a salary of £100 per year with board and lodgings. It is understood that several dispensers holding the Major qualification were ready to offer their services, but the vacancy was filled without advertising, and without giving such applicants an opportunity of having their claims considered. Mr. Alexander is well acquainted with the work, having previously acted a few years ago as assistant dispenser under Mr. Arthur.

**MANCHESTER COLLEGE OF PHARMACY.** On Tuesday evening a conversation was held at the Manchester College of Pharmacy, when Mr. Charles Turner and his students entered a number of articles of about £30 being present. Some of the students gave an instructive exhibition of the preparation of pharmaceutical products, while others enlightened their guests by means of the microscope, showing mostly botany and materia medica slides of interest to the pharmacist. The laboratory were being prepared spiritus estheris nitrosi, by Mr. Southam; ascept ether, by Mr. Kent; propyl alcohol from fossil oil, by Mr. Carter. A determination of nitrogen in styrene was conducted.
PREPARATION OF EXTRACT OF BEEF AT CHICAGO.

In an article in Monday’s Times, on “Diseased Meat,” the following paragraph occurs: ‘Certain circumstances incidental to the preparation of a so-called ‘extract of beef’ are almost too revolting for publication. This concoction—extract of filth” our correspondent calls it—is offered to the public in dainty jars, but is made from the sweepings and drainings of the refuse from the canning rooms and cellars, and is thus something very different from the luscious extract of ‘chole cuts of beef’ which the consumer may innocently think he purchases. The room in which this delectable compound is prepared is described as a room of “‘typhoid atmosphere.’ ‘The smell,” says our correspondent, ‘sickened me completely.’ The surroundings of the room were filthy. There were several cans lying around containing the extract in its crude state, and several trucks containing the liquid extract of beef. Whilst standing there, two fully-developed rats that had fallen into one of these cans of extract, and had been drowned, were pulled out by the man in charge of this department, just previous to using the contents. How long they had been there cannot be proved, but the fact remains that decomposition had already set in, and the skins and hair were leaving the bodies, and this is an every-day occurrence. ‘We understand that material of this description finds its way upon the market under the guise of a name which was well known before the Chicago meat trade came into existence. The question arises, How is the unwary consumer to be protected?”

A CHEMIST’S ASSISTANT’S MISTAKE.—On February 27 an inquiry was held at the Public Offices, Skelmisdale, near Ormskirk, before the county coroner (Mr. Brighouse), relative to the death of Henry Whittingham, a master clogger, forty years of age, residing at 18, Propriety Lane, Ormskirk. The deceased, who was the husband of the deceased woman, stated that the deceased was her brother. He was single, and lived alone. She called to see him on Monday afternoon about five o’clock. He told her he did not feel very well, and asked her to get him some brandy and a black draught from the chemist’s. She took a bottle labelled “black draught,” and went to Holt’s chemist’s shop in Sandy Lane. A youth named Arthur Holt was in the shop, and she asked him for a black draught and gave him the bottle. No one else was in the shop at the time. He took a bottle down from the shop which was labelled “Opil,” and poured some of the contents into a measure and then into the bottle which she had given him. She gave the bottle to the deceased, and left him. She was sent for next morning at half-past nine, and found the deceased unconscious. He never recovered consciousness, and died about noon.

Dr. Morris stated that when he arrived at the house he found the deceased in bed quite unconscious. From the enquirers he made, and from an examination of the bottle labelled “black draught,” he came to the conclusion that the deceased had taken some kind of poison. He used the stomach pump and all available means to restore him to consciousness, but without avail. There was no doubt that death was due to opium poisoning.

Charles James Henshaw, a qualified chemist, stated that he managed the shop for Mrs. Holt. He had been in charge a month. He believed Arthur Holt had been an assistant in the shop about three years. He saw nothing of the transaction on Monday evening in question, and knew nothing of the bottle. The black draught bottle was in its usual place on the shelf—between the bottles containing opium and ammonia. The three bottles were all of the same size and colour. This was their usual position. He had not heard that this was not the first mistake that young Holt had made. He had not heard of people bringing bottles back, complete with the mixture. He knew it had often been suggested that poisons should be kept in blue and green bottles.

Arthur Holt, after being cautioned by the coroner, elected to give evidence, and stated that he was eight years of age. He had been four and a half a year in the shop. The tincture of opium had been in the same place on the shelf during the whole of that time. He remembered Mrs. Robinson coming into the shop on Monday evening for the black draught. He turned round and took down what he thought was the black draught bottle. If he gave her one instead, he explained, he had no recollection of which bottle he put up his hand he thought he got hold of the right bottle. He poured the drug into a measure, and then into the bottle she brought with her. He admitted he might have made a mistake.

The coroner, in summing up, said there could be no doubt about the facts, although Holt had, under protest, admitted he might have made a mistake. There was no doubt that he had supplied Mrs. Robinson instead of a black draught about an ounce of Laudanum. There had been great carelessness. There had been carelessness on the part of the manager of the shop in supplying the tincture of opium to be on the shelf near a harmless drug, and there had been gross carelessness on the part of Arthur Holt in supplying a poison instead of a black draught, and thus bringing the deceased to such a sad end. It was for the jury to say whether this carelessness was of such a degree as to justify them in saying it was criminal or only censurable.

The jury retired to consider their verdict shortly after five o’clock, and at a quarter to seven the foreman of the jury (Mr. Thomas Garner) intimated to the coroner that they could not possibly agree upon a verdict.

The coroner adjourned the inquiry until Monday, March 4, and it is understood that if a verdict is not then arrived at, the jury will be bound over to appear before the judge at the next Liverpool Assizes.

The coroner has ordered a post-mortem examination to be made by Dr. Morris.—Liverpool Post.

PHARMACEUTICAL FOOTBALL CLUB.—The match to have been played last Saturday between the Pharmaceutica! and Cillosald was scratched by the latter club.

ROYAL INSTITUTION.—A general monthly meeting of the members of the Royal Institution was held on the 4th inst., Sir James Crichton-Browne presiding.

The following were elected members: His Grace the Duke of Newcastle, Lient. Col. W. W. Rawes, R.A.; Dr. Marmaduke Prickett, Miss C. E. Bradshaw, Mrs. W. N. H. Johnson, and Miss F. M. Betta, R. A. Bray, M. Bulloch, G. Bywater, G. F. N. Clay, C. S. Dickson, J. J. Elliott, J. Garvie, F. L. Harris, E. G. Harrison, S. O. Hogg, E. Law, G. H. Ogston, B. F. Portal, B. S. Port, W. T. Shaw, J. H. Slater, J. J. Walker, W. H. Walker, and A. F. Walker. The special thanks of the members were returned to Mr. William J. Farrer and Mr. John Douglas Fletcher for
EPITOME OF CURRENT EVENTS.

Pharmaceutical Journal.

GLASGOW AND WEST OF SCOTLAND PHARMACEUTICAL ASSOCIATION. — The annual supper of this Association took place on Thursday, February 28, at the Alexandra Hotel, Bath Street, when about sixty gentlemen were present. The chair was occupied by the President, Mr. W. L. Currie.

The usual loyal toasts were duly honoured, the "Army, Navy, and Reserve Forces" being proposed by Mr. A. Laing in a clever and very humorous speech. Mr. J. Rutherford Hill, Edinburgh, then proposed "The Medical Profession." In the course of his remarks he said pharmacists hoped the day would soon come when a drug shop would be only a place to obtain medicines, and when medical advice would be obtainable only at the residence of the medical practitioner. The great advances made by medical science during very recent years increased the respect in which the medical profession was regarded. The old days of empiricism were passing away, and now, by methods of treatment founded on well-ascertained scientific principles, such terrible scourges as cholera, rabies, tuberculosis, small-pox, and even influenza were being successfully attacked, and it might be said with some confidence that the progress of medicine was so rapid that any one who was not happy in being able to couple with this toast Dr. D. J. McVail, who, by reason of his eminence in the department of sanitation and preventive medicine, was well worthy to be thus associated.

Dr. D. C. McVail, in responding, said it was an honour to him to reply for his profession to an address so capable of right judging. The public could not judge of the capabilities of a medical man. A practitioner might attain a distinguished position, and have many distinguished patients, and yet the profession might know nothing of such a man that entitled him to high professional rank. No lawyer or divine could attain eminence without merit, but he was the special and peculiar distinction of the medical profession. He agreed with what had been said as to the relationship between medicine and pharmacy. There could be no doubt that, as medical and pharmaceutical science advanced, they would be as inseparable as the roots and branches of a tree, and by that circumstance by which he had been greatly astonished. The advance in pharmacy made a higher scientific qualification necessary on the part of the pharmacist, and it was a surprise to him that in connection with the legislation drafted by the Universities, the Commission of Science and Art of Scotland that it made a claim for university recognition. Under new regulations they were to grant degrees in medicine, in agriculture, in engineering, sanitary science, public health, and he wondered that they had ever thought of a degree in pharmacy. The medical profession had a claim for university recognition just as such a society as the Pharmaceutical Society had. If they had their claims he believed the Commissioners could have given the degrees of B. Sc. and D. Sc. in a department of pharmacy. It was unfortunate at such an opportunity had been missed, but perhaps pharmacy had been looked on as such a trivial subject as not to urge its claims. It was emphatically an urgent subject, including chemistry, botany, materia medica, and much more, and he thought it was a great pity that they did not assert their position. He had to thank them for the cordial way in which this toast had been proposed and received.

Dr. A. M. Sinton proposed "The Pharmaceutical Society of Great Britain." He regarded the Society as a most valuable one for chemists and druggists, and he would strongly advise them all to become connected with it. Before many years had passed he believed all the shops in Glasgow would be conducted by qualified chemists. When he came to Glasgow in 1847 he did not think there were more than ten druggists' shops in the whole town, but now the number was largely increased. He regretted that comparatively so few assistants in Glasgow had passed the qualifying examinations of the Pharmaceutical Society. They were not so very hard, and with perseverance any intelligent assistant could easily pass. He trusted they would soon see a much larger number going up.

Mr. Charles Kerr, Vice-Chairman of the Executive of the North British Branch, in responding, said it was an easy duty, for he knew that Glasgow chemists and druggists had done all that was in their power to further the claims of the Society than they used to be, and, moreover, they had had so recently brought before them the various points of the Society's work by their able President, Mr. Carteige. He held that joining a Society like the Pharmaceutical Society should not be regarded as a mere question of local benefit, but from the point of view of advancing the general good of pharmacy. There was one recent occurrence which they must all have noticed. He referred to the addition to the Pharmaceutical Journal of a supplement containing interesting trade matter. That, he thought, was a great improvement, which should have been adopted years before. He had found when trying to get members for the Society that a man who would not take a patriotic view of membership would ask, "What do you get for your subscription?" He would mildly suggest "You get the Journal," but to a non-scientific man this inducement was not good enough. The supplement was a decided step in advance, and if still further developed to make the Journal more useful to the busy retail chemist, it would be a valuable means of increasing the membership of the Society. He thought it was a great scandal that so few, out of so large a number of chemists and druggists, were members of the Society. They would never get legislation such as they desired till all the chemists on the Register became members of the Society.

The Chairman then proposed "The Glasgow and West of Scotland Pharmaceutical Association." He said their syllabus for instruction had been a very interesting one, and it was a great satisfaction to see that their own members were taking such much interest and bringing up useful subjects for discussion. They had appointed a Committee to prepare a report on the new Pharmacopenia for the Faculty of Physicians and Surgeons, and he had no doubt that the Committee would do a great deal for them. They had also had several lectures of a high order, but the attendance had not been so good as it might have been. They had been exceedingly unfortunate in the matter of weather. One feature of the session had been the visit of Mr. Carteige. His speech and its reception by the Glasgow Pharmaceutical Association, and they would seek to have its efforts crowned with success. If the Society was to obtain extended powers they must support it. It was useless for
those outside to say "What has the Society done?" They were done with the past, and the one question should be "What can the Society do?" It was the future and not the past they had to consider. He would say to all, "Become associated with the Society. Outside they could do nothing; inside they could do a world of good. If the Council did not represent their views they could turn them out and get their views represented. He believed, if the case were fairly put, the public would recognise their claims and admit that medicines should be got only in chemists' shops. He observed that a new Pharmacy Bill was to be drafted, and he hoped it would meet with the approval of chemists and druggists. If that had been secured in 1888 there would have been no quibbling now about stores, and pharmacy would have been in their own hands. He thought the chemists and druggists at that time made a great mistake, but he hoped those of to-day were more enlightened. There was one thing the Society could do, and that was to confer upon every registered chemist the privilege of membership and the right to sit on the Council. Till that was done he did not think the Society would attain to adequate popularity, but if it was done he believed there would be a change for the better. He was glad to say their own Association was in a favourable condition; and the membership had been well maintained. He would take this opportunity of saying informally that the Prize Scheme instituted by Mr. Kinnimont was being put in definite shape. Owing to ill-health he (Mr. Currie) had been unable to attend the meetings of his colleagues, but he had been appointed by the Council to fill the office. During the next month all chemists in Glasgow would be called upon for annual subscriptions, and he hoped every chemist and druggist in Glasgow would pay. He would also remind them of the benefit fund; it was a good fund, and it behoved them all to support it to the best of their ability.

The toast was then drunk with much enthusiasm. Other toasts were "The Strangers," by Mr. J. Moir, acknowledged by Mr. Cairncross; The Coupilers, by Mr. Molloy; The Council, acknowledged by Mr. J. Foster and A. Leang; and "The Chairman," by Mr. J. McMillan.

The evening's proceedings were enlivened by songs and recitations by Messrs. Bruce, Currie, Laing, Leiper, McKellar, and Steven; ocarina selections by Mr. W. Cunningham; and a ventriloquial performance by Mr. Cairncross.

ROYAL INSTITUTION.—On Tuesday, February 26, Professor Stewart continued his description of the structure and supporting skeleton of corals. Dealing with the Madrepora or perforate corals, he described the manner in which the individual polyps are connected by coenosar, by special ectodermic cells of which carbonate of calcium is deposited. The coenosar increases in proportion to the growth of the polyps, and the deeper-seated layers retain their vitality; the coralium is therefore in a better position than other allied genera to repair any injury to the surface of the animal. The outer layers of horny material, and thus build up a cone invested by coenosar; the skeleton, however, is not of any technical use, as the layers of which it is composed exhibit a tendency to separate. Frequently these horny masses are furnished with thorn-like projections, which are constant in their character and serve to distinguish the various species from one another. In the bithoral, or Helicopora, large tubes bounded by small spines contain the polyps, and are surrounded by numerous small tubes with spines projecting from their upper terminations of their walls. These smaller tubes are formed by the effusion of solid carbonate of lime, and in certain other corals, such as Epongea, the so-called "dead men's fingers," etc., cells of the ectoderm wander into the mesoglossa and secrete spicules of carbonate of calcium, as they do in the calcarious sponges. In other species the spicules take the form of minute discs, which are present in immense numbers.

The specimens exhibited and shown under the microscope included Helicopora, Antipathes, Tubipora, Seraphyon, Melitodes, Epongea, etc.

In the succeeding lecture on March 5, Professor Stewart first described the structure of the organ-pipe coral, Tubipora muscula; in this species a number of paired tubes bearing transverse plates known as "platforms" are united by a central axis. The spicules are themselves tubular, and thus all the polyps are in communication with one another. The endo-skeleton consists of a number of tubular spicules formed by ectoderm cells, which have migrated into the mesoglossa and multiplied to such a number of another that they constitute the hard coral. In the lower portion of these organ-pipe corals the flesh withers from want of nourishment; the inner living layer shrinks away from the tube and, becoming itself spicular, forms a second smaller tube within the original larger one. In the Gorgonides, a group of Octocorals, an endo-skeleton is present in the shape of a central axis, supporting material covered by a differently constituted polyp-bearing crust.

Red coral, which the lecturer next described, is a dense and continuous calcareous mass. In this coral the polyps are connected by tubes parallel to the axis on the inner surface of these tubes the ectoderm probably secretes the calcareous matter which forms the solid coral. The interesting scales which close the aperture of Calypogia and protect the polyp, and the exquisite spicules which form the defensive structures of Acanthogia were alluded to; the lecture was illustrated by specimens of Olaxipora, Elminia, Verriania, Acanthogia, Plessogorgia, etc.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.—A meeting was held on Thursday, February 26, Mr. T. A. Henry, Vice-President, in the chair. A paper was read, entitled "Notes on Bacteriology" by A. Lilly. The author commenced with a description of bacteria generally, their mode of life and reproduction, and some of their most noticeable effects, such as putrefaction and fermentation. Their general prevalence in the lower layers of the atmosphere was noted, but their absence or comparative absence at great elevations was illustrated by the experience of the observatory staff at Ben Nevis, who regularly contract the "Ben Nevis cold" on descending to lower air, but remain free from colds on the summit, except what visitors from the lower regions pay them a visit and bring the microbes. The action of heat, cold, and various reagents on bacteria was described, attempts being directed to the difference between disinfectants and antiseptics and the use of the two for pathogenic varieties were individually described, and specimens were shown of Bacillus tuberculosis, K. anthracis, B. acidii lactici, and Spirillum cholerae asiatica. The note on "Argon" by Mr. A. M. Peter was postponed as Mr. Peter had been laid up by illness and unable to finish it.
Press Comments.

The Historic Winter of Europe.—For the duration and severity of its wintry weather the year now passing stands out as an annus mirabilis. Among its predecessors similarly notable was 1402, when the Venetian lagoons were frozen over for many weeks, and 1441, when Lionel d'Este entertained on the frozen Po a magnificent company of Burgundians. In 1499 not only the Venetian lagoons, but the ports of Genoa, were one mass of solid ice—a state of things repeated in 1608, when Marseilles Harbour was also frozen. In 1834—5 the Mediterranean was frozen at Marseilles, and the Adriatic at Venice, and on January 23 and 24, 1885, the Arno at Florence was a racetrack bearing not only the competitors, but innumerable spectators. In 1657—58 nearly all the Italian rivers were frozen with ice, and Rome was well-nigh buried under snow, while in Sweden King Charles X. crossed the Little Belt on foot at the head of 20,000 soldiers, though at the close of the march the ice gave way, and some squadrons of horse perished. The winter of 1705 was terribly severe, as was also that of 1709—the year of the Battle of Pultowa, when for three months all the European rivers were frozen over, as well as those of North America, and at Paris the thermometer sank to 28° below zero. In 1740 there was a blizzard in Britain so violent that the front of which was planted a park of artillery made of ice which, charged with shot, plundered at sixty paces an axis of 54 kilometres. In 1776—77 all the Italian rivers were frozen—a state of things repeated with still more severity in 1798—99, when the deepest lakes were covered with thick ice, and the temperature from the south to the north of Europe descended from 20° to 40° below zero. Again, in 1794—95, the French cavalry, by a brilliant operation on the frozen Terci, captured the Dutch fleet. Similarly severe was 1798—99, the thermometer registering 17° below zero at Lodz. The winter of Napoleon's retreat from Moscow was an annus mirabilis for rigour; that of 1819—20 was remarkable for many successive weeks of unbroken frost, as was also that of 1829—30, so disastrous to agriculture. In the Alta Italia in 1844—45 sentinel horses on duty were frozen at their posts, while hardly less painfully memorable are 1852—53, and 1861—62. We can hope forgotten the terrible winter of 1870—71, from which all Europe suffered, notably the troops besieging and defending Paris. Long and rigorous was the frost of 1879—80—the thermometer marking at Place Vau 18° below zero. Very heavy and persistent snowfall characterised 1887—88, between which and the present the most severe winter was undoubtedly that of 1890—91.—Lancet.

Sulphur Poisoning.—Max Nordau, in his interesting work, 'Degeneration,' says that the poisoning of civilized peoples continues to increase. He is referring chiefly to alcohol and tobacco, but there is a widespread and dangerous tendency among the public, especially during an epidemic like the present, to fly to the indiscriminate use of drugs. We are sorry to see in a lay contemporary a summary of treatment, not only hygienic, but therapeutic, called from various quarters to depress these antidotes. Mentioned, and doubt these are valuable drugs when employed under medical supervision; but we wonder how many people, after reading the article we refer to, will take either or both on their own responsibility, possibly with serious results. Our object is not to depreciate these antidotes, but to warn the average citizen that if he thinks he has influenza he should call in his medical man to prescribe for him, and not dose himself. Dover's powder is poison, and the responsibility assumed by our contemporary in recommending to its numerous readers the use of the powder indiscriminately is very considerable. Another paper enjoying a well-deserved reputation has published the recipes of three London physicians against influenza. No doubt this was well meant; but it would have been, had the recipes been correctly given, a dangerous inducement to mischievous self-dragging. As the doses, however, are all wrong the advice gratis may prove especially pernicious.—Lancet.

It appears as if the efforts of Professor Armstrong and other leading experts in scientific education to improve the methods of teaching chemistry in this country are about to be crowned with success. There can be no doubt that setting beginners in chemistry at test-tubing tends to diminish for good whatever scientific curiosity the pupils may possess. It produces analytical machines instead of reasoning beings. The only possible "advantages" of setting a class of boys at test-tubing are that unfortunately at present it pays best from an examination point of view; and that from the teacher's point of view it is much easier to keep a large class 'going' at this than at experiments, each of which would involve probably some personal supervision by the teacher for each pupil. It is, however, probable that increasing interest in their work would nullify this latter argument. In any case the question can only be solved by a re-casting of all the syllabuses in Practical Chemistry examinations throughout the country. —Technical World.

The number of popular biological periodicals which are now issued is remarkable, the more so considering there is no periodical which confines itself to chemistry or physics. For example, Natural Science, Knowledge, Science, &c., are almost exclusively biological, and the most readable articles in Science Progress are the biological ones. There is no doubt that the problems of biology come home to the average man much more than a physical problem. Heredity, evolution, and such problems are easily grasped, at least in their main features, and a distinction of them is "in the street." This popularity of biology does not, we fear, indicate more students, but more dabblers.—Technical World.

The claim of M. Charles Olszewski, the Polish chemist, for priority over Professor Dewar is, to put it mildly, singularly inopportune, and, in our opinion, a weak one. English scientific men were well aware of the Polish chemist's work (as well as that of Wroblewski), which itself was in every respect simply a continuation and development of Callislet's work on the liquefaction of the permanent gases. Callislet's work, again, was simply an application with more perfect apparatus, and in the light of hadri's researches, or Faraday's great pioneering work. Professor Dewar never, as far as we know, claimed to have first liquefied O, N, or air (nor can M. Olszewski); but he liquefied them in much larger quantities than before, even doing this on a lecture table capable of heating to several hundred degrees; he has investigated in detail the properties, both chemical and physical, of these liquefied gases; he has shown us how to preserve them for an unlimited time by means of a vacuum jacket, and recently has demonstrated how a great many apparently non-phosphorescent bodies become phosphorescent at very low temperatures. Finally, he has experimentally shown that chemical action practically ceases at very low temperatures. He has done this; but because he has
not prefaced all his papers by a description of M. Olszewski’s work, he is hailed as a scientific plagiarist. If he is, then who is not?—Technical World.

The question of the qualifications necessary for becoming a Fellow of the Chemical Society has been fought out more than once. Any restriction of the present elastic conditions must necessarily diminish the number of new Fellows, and so the funds of the Society. This would produce a crippling of the powers of usefulness of the Society. Nevertheless, the public is misled by the use of the letters F.C.S., and too often imagines that the Society vouches for the scientific attainments of its Fellows. Unfortunately the persons who use these letters are generally analysts of no great reputation, specialists in advertisement essays, or pseudo-scientific teachers. It is a question which the society ought for its own honour to settle at once. Either insist on a certain minimum amount of training, or else do away, by some means or other, with the attempt to hoodwink the public by using the letters F.C.S. on advertisements or school prospectuses.—Technical World.

The Elihu Thomson electrical energy meter having obtained at the meter competition organised by the City of Paris a first prize of 5000 francs, Professor Elihu Thomson devoted this sum to facilitate the study of certain theoretical questions of great interest, and a committee of French scientists was appointed to examine and report upon the dissertations sent in. The prize has just been awarded to an American scientist, Dr. A. Webster, but on account of another paper being of almost equal merit, Professor Elihu Thomson and others have contributed to offer an equal sum of 5000 francs for the latter paper, the authors of which are Professor Oliver Lodge, F.R.S., of Liverpool, and Mr. E. T. Glassbrook, F.R.S., of Cambridge.—Technical World.

Obituary.

On March 4, Sir William Sociell Savory, 66 Brook Street, London, aged 69. Sir William was University scholar at London University, where he took his M.B. degree in 1848, and became a Fellow of the College of Surgeons in 1852. He was a创建 a Baronet in 1890, was appointed Surgeon Extraordinary to the Queen in 1897, and was also Consulting Surgeon to and a Governor of St. Bartholomew’s Hospital, and a past President of the Royal College of Surgeons.

Notice has also been received of the death of the following:—
On February 1, E. J. Northey, Chemist and Druggist, late of Truro. (Aged 54.)
On February 22, Donald Watt, Chemist and Druggist, Lybster. (Aged 60.)
On February 24, John Reece, Pharmaceutical Chemist, Isleworth. (Aged 57.) Mr. Reece had been a member of the Pharmaceutical Society since 1866.
On February 26, D. Gibson Milligan, Chemist and Druggist, Haltwhistle. (Aged 43.)
On March 3, Henry R. Sanford, Chemist and Druggist, London. (Aged 63.)
On March 4, William Dyer, Pharmaceutical Chemist, Halifax. (Aged 74.) Mr. Dyer died at 1, Corn Market, Halifax, from bronchitis following a severe attack of influenza. He had been a member of the Pharmaceutical Society since 1853, and had been in business at Corn Market for forty-five years during which time he was granted the Royal Warrant as “Chemist to Her Majesty.”
Personal and Trade Notes.

Mr. A. W. Gerrard, Pharmaceutical Chemist, Chertsey, and Examiner to the Pharmaceutical Society, has been appointed analyst to the Chertsey Urban Council.

The Financial News remarks "that shareholders in the Sanitas Company have reason to echo, in a way, the phrase invented by Lord Beaconsfield: Sanitas, sanitas, omnia sanitas! The concern has turned out a prosperous one for those interested; and for the year 1894 it pays 13d. per cent., which is a most excellent return to the investor. We are not concerned in the contentment of the managing director that Sanitas is almost the only non-poisonous disinfectant—that is a matter which rival manufacturers must fight out for themselves—but it is evidently a fruitful invention for money-making; in fact, if it gets rid of scents, it creates dollars instead."

The directors of Blesdale, Limited, York, in presenting their first balance sheet and report, state that since entering into possession on October 3, 1894, the trade of the company has shown a steady and satisfactory increase. There is a balance of £1,015 19s. 6d., and the directors recommend a dividend of 5s. 6d. per share, being at the rate of 64 per cent. per annum, free of income tax, for the respective periods the calls have been paid. This will absorb £519, and carry forward a balance of £1405 19s. 6d.

It is stated that the Bayliss Drug Co., after twelve months' life in Torquay, was sold up by auction last week. A combination of several of the chemists was agreed upon, and all the drugs were bought in Mr. Holloway's name at a very low price. After the distribution it is proposed to hold a supper to celebrate the event.

Poisoning Cases and Inquests.

**Rat Poison.**—A man named Afflick, aged 26, died on Wednesday, February 20, from the effects of a rat poison taken in mistake for a sedative powder. Verdict: "That the poison was accidentally taken, and that death was the result of misadventure."—*Portsmouth Times.*

**Landamen.**—Thomas Veal, aged 42, died on Sunday, February 24, at St. Phillips, Bristol, from the effects of oil of vitriol, self-administered. Verdict: "Suicide whilst of unsound mind."—*Western Press.*

**Oil of Vitriol.**—Ellen Allit, aged 27, died on Sunday, February 17, in the Derbyshire Infirmary, from the effects of oil of vitriol, self-administered. Verdict: "Deseased committed suicide whilst temporarily insane."—*Derbyshire Advertiser.*

**Carbolic Acid.**—Henry Bowland, aged 49, died on Wednesday, February 27, whilst on the way to the Northern Hospital, Liverpool, from the effects of carbolic acid, self-administered. Verdict: "Suicide whilst temporarily insane."—*Liverpool Post.*

**Prussic Acid.**—Frederick Edward Lilly, aged 44, died on Monday, February 25, at Pirntico, from the effects of prussic acid, self-administered. Verdict: "Suicide during temporary insanity."—*Morning.*

**Vitriol.**—A man named Arthur Elliot died on Sunday, March 3, at Derby, from the effects of vitriol, taken under the impression that it was something fit to drink. —*Nottingham Daily Express.*

**Poisonous Lotion.**—At Swansae, on Monday, March 10, a girl, aged 12 months, described as a Jewish science teacher, ok some lotion in mistake for medicine, and died most immediately.—*Evening Standard.*

Partnerships Dissolved.

John Standing and Frederick Richard Cooper, Chemists and Druggists and Mineral Water Manufacturers of Manchester, trading as Standing, Son and Co. The business will be carried on by Frederick Richard Cooper.

Thomas Ottay and Richard Bonner Morgan, Chemists and Druggists and Patent Medicine Vendors of Waterloo Street, Burton-on-Trent, trading as Ottay and Morgan. The business will be carried on by Richard Bonner Morgan.

Charles Ekin and Edward Joseph Appleby, Pharmaceutical Chemists of Argyle Street, Bath, trading as Ekin and Appleby. The business will be carried on by Edward Joseph Appleby.

Alexander Cook, M.D., and Percy Charles Evans, M.D., Medical Practitioners of Cardiff, under style of Doctors Cook and Evans.

Patent Office Business.

**Applications for Patents.**

No. 3775.—An improvement in bottle caps and seals.* February 21, 1895.

No. 3784.—Improvements in photographic shutters. February 21, 1895.
Specifications Provided During February.

Tannin (Hagemann, O. C.).—The invention consists in the use of amyl alcohol in which the various impurities present in tannin are soluble, as a solvent. The ground nuts, kernels, or crude tannin is digested with amyl alcohol at a temperature which generally lies between 60° and 70° C., but may be as high as 120° C. The extract is filtered and concentrated in this way, or, if of greater purity, it may be separated by agitating the solution with water, the aqueous solution being evaporated in vacuo. By another method, the tannin is precipitated by adding amyl alcohol to a mixture with benzene or other liquid, which mixes with amyl alcohol but does not dissolve tannin. The precipitated tannin is treated with benzene to remove all the residual amyl alcohol, and dried. Tannin treated as above contains some gallic acid, but it may be obtained purely by adding water to the mixed amyl alcohol and benzene solutions. This dissolves out the tannin only. No. 34,375 of 1893.

Lead Salts (Lake, H. H., communicated by Tibbitts, J. B.).—The innovation comprises means for imparting a permanent colour to carbonate, sulphate, or other salt of lead during its manufacture by electrolytic processes. One method consists in adding to the electrolytic bath, a dye of the type of anthraquinone and another of the supplementary anode of a metal which produces the desired colour. The colour is said to be more regular and more permanent than when a pigment is added after the salt has been prepared. No. 29,651 of 1894.

Cocoa (Boisselier, H.).—The cocoa is compressed into the form of tablets or pastilles, containing measured quantities, and preferably having concave sides. The common practice of adding water to assist the extraction of the fat while in pastes after nib-grinding,” is modified by using a liquid extract of cocoa. No. 6517 of 1894.

Bottle Stoppers (Webber, M., and Léôthe, M.).—The stopper or cap of a bottle of wine is hinged to a ring fixed round the neck, and has a plug fitted into a rubber ring around the portion which enters the neck of the bottle, etc. It is secured in the closed position by a hinged catch. No. 8161 of 1894.

Corks (Loach, E. O.).—The invention relates to the metal caps which are often fitted to the tops of corks. A plain metal capsule is secured to the top of the cork, with its flange turned inwards to grasp it firmly, and another ornament, again fitted over it, where the flange also turned inwards, and so shaped that the strain upon it in drawing the cork forces the flange of the inner capsule more firmly upon the cork. No. 15,790 of 1894.

Sea-sickness, preventing (Waldron, W. G.).—A draught of spirit, prepared in spirits of ginger, lemon, peel, raisins, sugar, isinglass, quinine, brandy and water in stated proportions. No. 21,968 of 1894.

Trade Marks Applied For.

[Compiled from the Trade Marks Journal.]

184,681.—SISTIS, and name and address of applicant and other wording on a label.—A hair lotion.—Francis Emilie Becker, 55, and 57, Hatton Wall, London, E.C. December 4, 1894. The essential particular is the word "SISTIS."

184,684.—SANNETTO.—Perfumery (including toilet articles, preparations for the teeth, hair, and perfumed soap).—John Dicker, 58, Graves Inn Road, London. January 5, 1895.

185,017.—DERENNIA.—Perfumery (including toilet articles, preparations for the teeth and hair, and perfumed soap).—Henry John Miller, 47, Oswald Street, Glasgow. January 21, 1895.

181,615.—"TOYOVEN."—A new one-solution photographic developer. A chemical substance used in photography. —Henry Robert Browne, 1, Cornfield Road, Eastbourne. August 19, 1894. The essentials particular is the word "TOYOVEN."

Market Report.

Chemicals and Drugs.

The Chemical Market.

Thursday, March 7, 1895.

We are unable to chronicle any marked changes in the Chemical Market during the past week. There have been but few alterations in the quotations, and where changes have occurred no important features have been presented. Quotations remain generally steady, having been in a quiet state, and it remains quiet at last week's rates. Tartaric acid has generally been a dull market, but towards the close a improvement has been manifested, and a rise would suit us. Oxalic acid remains steady. There has been no change of importance in sulphate of ammonia, but it has maintained its position, having been in continuous steady demand at last week's rates and a slight advance, but close to the previous quotations. Carbonate and nitrite of ammonia are unchanged. Arsenic and arsenious acid, supplies being still but small; whilst the weak market is borax has not been improved upon. Copper sulphate has been in brisk demand at unchanged rates. Cream of tartar continues in steady demand, top quotations showing an improvement on last week's quotations. Mercurials and quicksilver are unchanged. Potaash and soda compounds show a weak market at practically unchanged rates.

ACID, BORACIC.—Still quoted at 30s. for crystals, and powdered at 32s.

ACID, CITRIC.—All tendency to improvement has died out, and but little business has been passing. Quoted last week's rates of 1s. 11d. to 1s. 2d.

ACID, OXALIC.—Unchanged, but in steady demand. Quotations are still 8d. net, ex rails.

ACID, TARTARIC.—Last week's quotations still held, but at keen rates. Stock must be regarded as scarce, and closes very steady, with a tendency to advance. English makes are quoted at 104d. to 11d. Foreign ditto, hot powder and crystals, are returned at 104d.

AMMONIA SALTS.—Sulphate continues in steady demand, with a tendency earlier in the week to advance. At the close, however, it is quoted at last week's rates. Prices for grey 24 per cent. are returned at 21l 7s. 6d. Carbonate : Unchanged. Last week's quotation of 9d. to 3d. still hold. Salt ammonium : Last week's rates remain unaltered. First quality is still quoted at 32s., six seconds at 37s.

ASHES.—In steady demand at unaltered rates. Prices still rule at 35s. for American, 32s. for Japanese, and 30s. for Chinese.

ARSENIC.—Supplies continue small, and firm market. Quotations unchanged at 14s. 9d. to 15s.

BLEACHING POWDER.—In fair demand, with prices well maintained. Quoted at 8s. 6d. to 8s. 9d.

Boric Acid.—Market continues very dull in tone, and an improvement seems probable. Quotations returned at still 19s. 6d. for crystals and 30s. 6d. for powdered.

COPPER SULPHATE.—A steady market, and the quotations are very firmly maintained. The prices still returned at 2s. 17s. 6d. for ordinary to 2l 15s. 10d. for special brands.

CREAM OF TARTAR.—The improvement noted last week continues, and the demand has been fairly steady at an advance in the last quotations. White crystals are quoted at 6s. 6d. to 6s. 8d., with powdered at 6s. 8d. to 7s. 6d. MERCURIALS.—Unchanged. Quantities up to 200lbs. still returned at 6s. 9d. Red precipitate is 2s. 6d. ditto, 3s. Corrosive sublimate is 5s. 6d.

QUICKLIME.—Firm, but quotations are unaltered. In first hands the prices are still 2s 10d., approximate to those quoted by second-hand holders, which drops to 2s 6d. in London.

SODA COMPOUNDS.—Quiet. Caustic Soda, 70 per cent is still returned at 2s. whilst 27 is asked for 60 per cent. Soda crystals steady at 35s. to 35s. 6d. Bicarbonate of Soda at 27s. 6d. (London). Hypophosphite is returned at 2s (Liverpool) in 1 cwt. kegs.
THE DRUG MARKET.

The sales to-day passed off very quietly. Ipecacuanha was largely offered, and sold freely at low rates. Eucalyptus oil was in good supply, but a great amount of business was not done. Details.—

ACACIA.—A fair amount was offered, but little changed hands. Six bags dark lumpy Australian gum was sold at 22s. 6d. of a parcel of twenty-six packages. Fine white Indian gum was bought in at 2s. 6d., whilst fair pale quality was held at 7s. 6d.

ACONITE.—Fifteen bags fair Japanese root were bought in at 9s.

ALOE.—In moderate supply. Thirty three boxes of Curacao sold to-day at 47s. 6d. to 55s., for good bright livery qualities, whilst 15 bags Sostroine fetched 60s. A parcel of 89 boxes Curacao was sold at 18s. 6d. to 19s. For very ordinary and gross. Cape was in fair demand, 17 cases being sold from 22s. 6d. to 23s. 6d., with 12s. paid for the drossy article.

AMBERGIES.—In fair supply, but little sold. Fair brown flake was bought in at 5s. 6d. to 70s. About 16 ozs. were sold at 20s. 6d. to 50s., for common qualities.

AMMONIACUM.—Seventeen cases were bought in.

ANIS.—Sixty-four bags Spanish were bought in at 46s.

ANATTO.—Four bags were bought in at 44d.

ARECA NUTS.—Seventeen bags, offered without reserve, were all sold at 14s. 6d.

ANTIMONY.—Fifty cases crude Japanese were bought in at 27l. 15s.

ARABINDA.—Six cases good bright broken block were bought in at 5s.

BENZOIN.—In fair supply to-day, but all bought in.

BUCHE.—Only small quantity offered. Good bright long leaves were bought in at 9d.

CAFFEINE.—Continues in firm demand at 15s.

CALCUBMA.—Ten bags fair root sold at 30s. 6d.

CAMPHOR.—Crude China was all bought in, whilst twenty-six cases of refined Japanese in squares was bought in at 1s. 5d. Two packages crude German were offered and bought in at 1s. 4d., the limit being 1s. 4d.

CAMPHOR (refined).—Remains in steady demand at last week's quotations. German and English makes in bails or flowers are still returned at 1s. 6d., for ten oz. quantities, or 1s. 6d. for smaller quantities, with squares at proportionate rates.

CANNABIS INDICA.—In fair supply, but all was bought in at 24d. to 24d.

CARDAMOM.—In good supply and business was fairly brisk, steady prices being realised. Ceylon, Myrobal, good white medium to very bold, 3s. 10d. to 3s. 6d.; medium yellowish bright, 2s. 6d. to 3s. 6d.; small to medium, 2s. 6d. to 2s. 2d.; lean brown, 1s. 6d.

CASCARILLA.—Fifteen bales good bright small bark were bought in at 21s.

CASCA PISOARA.—Fifty-three bales were bought in at 21s.

CANTHARIDES.—Ten cases bought in, the limit being 1s. 10d.

CASTORUM.—Two packages offered, but did not elicit a bid.

CINCHONA.—A fair quantity was sold to-day. Of a parcel of 67 bales of brown and grey bark, 66 were sold, 10 without reserve at 1s. 1d., the remainder at 6s. to 11d., with best at 1s. 6d. No enquiries for red bark, all being bought in, his applies also to Java and East India, which were bought in at 1s. 9d. and 5d. respectively. A fair amount of yellow bark sold at 6d. to 9d.

COCA.—Eleven bales bright green to brownish leaves were bought in, the limit being 11d.

COLOGYNN.—Ten cases were bought in at 1s. 10d., the mid, 1s. 9d., not being forthcoming.

COCAINE.—Previous quotations still hold. Firm at 18s.

CODEINE.—Steady at 12s.

COFABABA.—Was all bought in. Marwanam at 1s. 7d., shina at 1s.

CUCURUS Root.—Fifty bales bought in at 15s.

CURARE.—Twenty-two bags from Bombay was sold to-day at 36s.

CUTTLEFISH.—Thirty-three cases bought in at 9d.

DOGG'S BLOOD.—Fourteen cases Singapore were offered and bought in. Good fine gum was worth about £11. Good red in hard lumps are bought in at £2 10s. to £3 10s.

ESQUIF.—A fair amount of Spanish was offered to-day, and was bought in at 8d. to 11d.

EUHOREUM.—Fourteen serons were bought in, the limit being 15s.

GAMBEG—Bought in at 210.

GENTIAN.—Fifteen bales bought in at 18s., the limit being 15s.

GLYCERIN.—Very firm. Manufacturers of the German and Italian glycerin are paying a premium. Good liquid is worth £1 15s. 10d. per cwt. to £2 5s. 6d.

HONEY.—Three packages offered without reserve sold at 14s. Jamaica was held at 27s. to 38s.

IPCECUAHANA.—Largely offered to-day, and fair business resulted, but the prices were vdry easy, and sales show a decline. Good sound annulated Rio root was selling at 5s., with 4s. 6d. for mixed ditto. Carthageana (Columbian) root was in considerable demand at prices ranging from 5s. 1d. to 6s. 6d.

JALAP.—Fair amount offered, but was all bought in at 1s. 5d. to 1s. 6d. for fair to Good Vera Cruz.

KOLA.—Fine bright root bought 1s. 6d. to 1s. 8d.

LIQUORICE ROOT.—Two hundred bags sold at 8s. to 8s. 6d. for common quality.

MENTHOL.—The leading brands are quoted at 15s. spot for good white crystals, whilst forward prices are 16s. 4d., C.A.F. terms.

MENTHOL.—Two cases of Cock's Japan in good white crystals bought in at 20s., with Japan at 16s.

MORPHINE.—Remains steady at unchanged rates, quotations being 4s. 6d. to 5s., according to quantity.

MYRRH.—Two cases sold without reserve at 71s. 6d. for good matured picked, with sorts bought in at 60s. to 71s. 6d.

OILS (ESSENTIAL).—Aniseed.—Roman at 6s. 6d. to 6s. 8d. at a slight decline. Quoted at 5s. 8d. to 5s. 9d. Cassia: Steady at unchanged rates. It is worth 4s. 6d. to 5s. 3d., according to the percentage of cinnamaldehyde.

Peppermint: H. G. Hotchkiss' brand is steady at 8s. 10d. 10s. Japanese oil, 40 per cent. remains at last week's rates, being quoted at 8s. 6d., with dekmentholised oil at 6s. 6d. to 7s. Lemon oil is rather easy, 6s. f.o.r. representing a fair quotation for a standard brand of guaranteed pure. Eucalyptus has been of interest of late, at very firm rates, as indicated in last week's report; and as long as it is grippe continues, the demand will be maintained. It can, however, safely be said that the phenomenal prices reached two years ago will not be repeated, as the stocks held are very considerable, and the present time affords a favourable opportunity for disposing of them on good terms. The demand has been especially shown for the lower-priced oils. Sales privately by one of the largest importers have realised 1s. for common Sydney oil, with Tasmania, containing 50 per cent. to 60 per cent. eucalyptol at 1s. 6d. The quotations of the principal Continental distillers do not show any marked change, but from all accounts a considerable rise in all oils the produce of Grasses and surrounding district is very probable, owing to the severity of the weather. This influence has already altered the quotations of the principal English distillers; in fact, the Mitcham oils have gone up by leaps and bounds during the last few days, and will continue to do so. English Lavender oil is now worth 70s. to 72s., with Mitcham peppermint at 38s. Oils (essential) eucalyptus: Three half coppers sold at 8s. 6d. Eucalyptus was bought in at 3s. 8d. and 5s. 6d. Glabulos oil was taken out at 8e. 6d., and Amygdaline oil at 1s. 9d. to 2s. Cinnamon oil was bought in at 8d. to 1s. Bergamot: Three half coppers sold at 8s. 6d. Citratus was bought in at 3s. 8d. oil bought in at 9s. to 10s. Rose oil settlings sold at 1 Aer., with the oil bought in at 9d.

ORTE (FIXED) AND SPIRITS.—Limes has fluctuated somewhat, but throughout the week the market has been steady. It is now quoted at 20s. 13s. 6d. Cotton has been in slow demand at slightly easier rates. Quota-
EPITOME OF CURRENT EVENTS.

Saturday, March 9.
Pharmaceutical Football Club v. Mallares Bovans at Worthington Farm, Shepherd's Bush, Commenced at 3.15 p.m.

Sunday, March 10.
Sunday Lecture Society, at 4 p.m.
"Perpetual Motion" (Illustrated), by Douglas Carnegie.

Tuesday, March 12.
Royal Institution of Great Britain, at 3 p.m.
"The Internal Framework of Plants and Animals" (Ninth Lecture), by Professor Charles Stewart.
Institution of Civil Engineers, at 3 p.m.
Ordinary Meeting.
Royal Colonial Institute, at 8 p.m.
Ordinary Meeting.
Royal Photographic Society, at 8 p.m.
Liverpool Chemists' Association, at 7.15 p.m.
Annual Dinner at the Adelphi Hotel.

Wednesday, March 13.
Pharmaceutical Society of Great Britain, at 3 p.m.
Library, Museum, School and House Committee, Evening Meeting at 8 p.m.
University College (London) Chemical and Physical Society, at 5 p.m.
Ordinary Meeting.
Society of Arts, at 5 p.m.
Sheffield Pharmaceutical and Chemical Society, at 8.30 p.m.
"Recent Research in the Micro-Structure of Steel," by Professor Arnold.

Thursday, March 14.
Royal Institution of Great Britain, at 3 p.m.
School of Pharmacy Students' Association, at 7 p.m.
"The New Element, Argon," by A. M. Peter.
Society of Arts, at 8 p.m.
"Art-Tuition," by Professor Hubert Herzog.
Chemists' Assistant Association, at 8.30 p.m.
Midland Pharmaceutical Association, at 8.30 p.m.
Social Meeting at the Midland Hotel.

Friday, March 15.
Royal Institution of Great Britain, at 3 p.m.
"The Rarer Metals and Their Allies," by Prof. Roberts-Austen.
Queckett Micropscopical Club, at 8 p.m.
Ordinary Meeting.

Saturday, March 16.
Royal Institution of Great Britain, at 8 p.m.
"Waves and Vibrations" (Third Lecture), by Mr. Rayleigh.

OFFERED.

Pharmaceutical Journal.—Vols. 8 to 34, bound; Linnean Journal, Zoology, vols. 14 and 15, bound; Chemical Journal, 1883-34, unbound; Photographs, 8 to 5, unbound.—Burnett, Worcester Street, Oxford.

WANTED.

The Analyst.—Volumes or numbers from 1891 inclusive. State prices, which must be moderate, to the care of J. Robinson, 185, South Lambeth Road, S.W.
Notes.

PHARMACEUTICAL FOOTBALL CLUB.—As previously announced, the annual dinner of the Pharmaceutical Football and Cricket Club will be held at the Queen's Hall, Holborn Restaurant, on Wednesday, March 20. Dr. Atfield, the President of the Club, is expected to take the chair at seven o'clock. Tickets (five shillings each) may be obtained from the honorary secretary, Mr. T. Tickle, 17, Bloomsbury Square, W.C.

BENTLEY'S BOTANY.—A new edition of this well-known classic will be published shortly by Messrs. I. and A. Churchill. It is being edited by Professor J. Reynolds Green, and will appear in two volumes. The first volume, which will be devoted to morphology and anatomy, and contain a large number of new illustrations, has been almost entirely re-written by Professor Green.

PHARMACY AT THE CAPE OF GOOD HOPE.—The Medical and Pharmacy Register for the Colony of the Cape of Good Hope, for 1894, contains the Act of 1891, with the rules and regulations based thereon; reports of the Medical Council and Pharmacy Board for 1893; and lists of licensed medical practitioners, dentists, humects, druggists, certificated midwives, and trained nurses.

A NEW EPIDEMIC.—The Berlin correspondent of the Standard states that a new epidemic now prevailing in the German capital, is regarded by Professor Virchow as a human form of the foot and mouth disease, probably caused by drinking the milk of diseased cows, the sale of which ought to be most stringently forbidden. It is almost restricted, as yet, to the south-western parts of the city. Billets in the mouth are the most characteristic feature of the disease, which generally breaks out very suddenly, several days after infection.

INTERNATIONAL EXHIBITION AT ATLANTA.—An international exhibition under the title of the Cotton States and International Exposition, will be held in Atlanta, State of Georgia, U.S.A., from September 15 to December 31, 1895. It has received the official endorsement of the United States Government, Congress having appropriated $200,000,000 for a government building and exhibit. The exposition also received the endorsement of the Legislatuired principal commercial bodies of all of the northern States, which will be represented by State buildings and exhibits. The management has established an office in London—Mansion House Chambers, near Victoria Street, E.C., and has appointed Mr. A. Socchi, who will supply all the necessary information, in addition to the late Professor Helmholtz has been choosen for the Physicalisch-technische Reichsanstalt of Berlin.

**CARBOLIC SMOKE BALLS AND MEDICINE STAMPS.**

At Marlborough Street Police Court on March 6, the Carbolic Smoke Ball Company (Limited), of Oxford Street, was summoned for selling a box containing a carbolic smoke ball without being stamped. Evidence having been given as to the purchase of a carbolic smoke ball by an Excise Officer, Mr. Arthur Newton, in defence, said in 1890 the company wrote to Somerset House asking whether it was necessary to have a stamp on the article in question, and received a reply stating that it was not. The magistrate pointed out that the authorities since that time might have altered their opinion upon the subject. Mr. Alpe, for the Inland Revenue, said in 1894 the company was informed that it was necessary to have the article stamped. The magistrate said he would be glad to grant a case upon the question. Mr. Newton did not desire to appeal, but he would like an expression of opinion from the magistrate as to the balls being stamped before they were sold, as the company had a large stock of the articles on hand. The magistrate said that the company could petition the authorities at Somerset House, pointing out that until the year 1894 it had reason to believe that it was acting within the law. A fine of 10s. was imposed.—Standard.

---

**WHAT IS BEESWAX?** At the Pontefract Petty Sessions, on Monday, February 25, W. R. Maud, J.F., chemist, of the Market Place, was summoned on a charge of selling to the prejudice of Wm. Henry Wilson, Inspector of Weights and Measures, etc., a certain drug, white wax, not of the nature, substance and quality demanded by the purchaser, but containing on analysis thirty parts beeswax and seventy parts paraffin wax, contrary to the Food and Drugs Act. Mr. Wilson said that on January 10 he visited the defendant's shop and purchased 4 ozs. of white wax and then notified that he intended to have the article analysed. On February 11 he received a report from the public analyst stating that the article was a compound of thirty parts beeswax and seventy parts paraffin wax. Mr. Maud accepted the analysis, but put the witness through a long cross-examination. This elicited that the officer had purchased many other articles from the shop of Mr. Maud, and had them analysed, but he declined to say what the report on them was. He had nothing to say about them. He granted that there was nothing but wax in the substance produced, but it was not white wax according to the British Pharmacopoeia. He paid for it at the rate of 2s. 6d. a pound, and the price of the best white wax was 4s. There ought to have been a label attached to show that it was not pure beeswax. Mr. Maud, in defence, objected to the summons, and argued that the article was not a drug within the meaning of the Act for either of these purposes. There were several articles entered in the same position as this in the British Pharmacopoeia, such as vinegar, mustard, flour, pearl barley, soap, sugar, tobacco, and treacle, but these were not made for medicinal purposes, and were not drugs. British Pharmacopoeia white wax was defined as "yellow wax bleached by exposure to moisture, air, and light." It was not white, but rather yellowish, and would not serve the purposes required in the laundry as the wax which the inspector bought, which was white, did. He claimed that what was asked for by the inspector was given him, but had he asked for pure beeswax, bleached, he would have got the other kind. He produced samples of each kind in court, and protested strongly that no attacks be brought against tradesmen to the risk of their credit. The case was dismissed, as was one against Mr. W. Bradley, chemist, exactly on all fours with it. — Pontefract Express.

**LIVERPOOL CHEMIST'S ASSOCIATION.** The annual dinner of the forty-sixth session of this Association was held at the Adelphi Hotel on the evening of Tuesday, March 12, when Mr. John Smith, President, occupied the chair, about one hundred members and friends attending. TheBox was supported by Messrs. A. C. Abraham, F.I.C., F.C.S., and M. O. F.G.S., Vice-President; Dr. Symes, Messrs. T. I. Abraham, R. C. Cowley, H. O. Dutton, J. Hesketh, J. T. Hornblower, J. Woodcock, J. J. Smith, W. Walling; A. S. Buck and T. H. Wardleworth (Hon. Sec. W. R. Smith, H. Peet, C. J. S. Thompson. The meet read letters from the Right Hon. the Lord Mayor and Professor Harvey Gibson. The guests included Professor Carter, M.D., B.Sc., F.R.C.P., Lonn., Professor Hele-Shaw, M.I.C.E. (President of the Engineers Society), Drs. Nevina, Barnes, Brannigan, Hansel, Ambler, O'Flaherty, Sharp, Logan, and Mr. L. Thomas. The menu was as follows:—

- **SOUPS.**
  - Oxtail.
  - Consommé Royale.

- **FIRST COURSE.**
  - Salmon.
  - Hollandaise Sauce.
  - Cucumber Salad.
  - Whitefish.
  - Petites Bouchées Montgolfier.

- **RELISHES.**
  - Strofin of Beef.
  - Yorkshire Pudding.
  - Saddle of Mutton and Jelly.
  - Vegetables.
  - Roast Turkey and Sausages.
  - Sausage.

- **ESTREETS.**
  - Bombe Middx.
  - Fruits.
  - Pastry.

- **Dessert.**
  - After the loyal toast had been well received, "A Medical Profession" was proposed by Dr. Symes, Professor Carter and Dr. J. R. Logan replying; "A Pharmaceutical Society," proposed by Mr. A. C. Abraham, Mr. A. S. Buck (Hon. local secretary); reply: "The Liverpool Chemists' Association," proposed by Dr. J. B. Nevina, replied to by Mr. Cook; "The Learned Societies," proposed by the President and replied to by Professor Hele-Shaw. The toast of the evening, "Our Guests," was proposed by Mr. Wardleworth. Our medical friends, Messrs. Kirkham, Edwards, Heggbotham, Platt, and Owens (humorist), with Mr. Liddell as accompanist, contributed a very excellent programme, placing dinner of 1896 among the most enjoyable gatherings held by this Association.

---

**INDIANA PHARMACISTS MAKE ANOTHER ATTACK.**—Indiana pharmacists are making another attempt to secure a pharmacy law, and we hope they will succeed in getting just the kind of a measure they wish. Bill has recently been introduced into the legislature of that state providing that any person who deals in the drug business (the compounding of prescriptions) must secure a license. Graduates of reputable pharmaceutical schools are to be entitled to practise, but without such diplomas all candidates must undergo an examination at the hands of the Board, and such graduates who fail must not practice. The proposition that a diploma for
college shall be accepted is one that we do not think wise, for the college diploma is by no means evidence that its holder is possessed of all the qualifications necessary to make him a safe compounder and dispenser. And then the matter of discrimination between colleges would keep the licensing board in hot water all the time. A college diploma signifies merely that the student has satisfactorily completed the course of studies presented by that institution. If the college graduate fears to undergo, or cannot pass, the examination of a board of pharmacy, it is about time his alma mater should make decided improvement in the publicum it supplies its students, and not wait until a court of law grants that one enough. No law can be made retroactive, hence those in business at the time of the passage of the act must be allowed to continue, but all others desiring registration thereafter should be required by examination to show their fitness. What we need more than any registration upon diplomas is some way of establishing uniformity of requirement by the boards of the entire country, so that a man who is a registered druggist in one state may be allowed to enter business in another without re-examination. Once a druggist always a druggist, and the Maine druggist should be considered competent in California.—Pharmaceutical Era.

DEPARED PRELIMINARY EDUCATION OF PHARMACISTS.—The secretary of the Minnesota Board of Pharmacy in his annual report to the governor emphasizes the necessity for better preliminary education on the part of applicants for examination. Too many boys are taken into drug stores without any education whatever, and the result is that they seldom acquire it afterwards. They then go before the board four or five years later, unable to write a legible hand, spell correctly, or write a grammatical sentence, and with little, if any, knowledge of mathematics or Latin. This is all wrong, as it is certain to bring chagrin and disappointment to such persons in the future, whether they are successful in passing the board or not, as board examinations are not primarily intended to cover these branches. The secretary believes it would be a wise provision of law which required some standard of general education before boys are taken into drug stores to begin their wvork in the drug store or laboratory.—Pharmaceutical Era.

CLAIMS "ANTITOXIN" AS HIS TRADEMARK.—Dr. George E. Dixon, President of the British Antitoxin Manufacturing Co., announces that his company is about to bring suits against some of the large manufacturers of the antitoxic cure for diphtheria, in order to prevent its being made under that name. Dr. Dixon claims he secured the name as his trademark in Washington in October, 1892, for a drug which he discovered years ago, and has used since in cases of fever and neuralgia. He says he has no intention of interfering with the sale of the name for medical purposes, but suggests that its makers call it "Diphtheria Antitoxic Serum," thus avoiding contention. A Broadway patent lawyer has charge of the suits.—Pharmaceutical Era.

THE USE OF TINCTURE OF LOBELIA.—Mr. E. Docker, coroner for North Worcestershire, held an inquest at the Trafalgar Hotel, Moseley, on March 7, concerning the death of William Sutton Hackett (60), traveller, residing at Chestnut Villa, Chestnut Road, Moseley. Evidence of the widow and daughter showed that he deceased had suffered from bronchitis and asthma, and, in consequence of being of very debilitated frame, he was advised by his medical attendant to drink a small quantity of tincture of lobelia at night. A bottle of the product was obtained from Mr. A. G. Holmes, chemist, but it was found to contain a very small quantity of the poisonous substance. It was stated that the tincture of lobelia was unsold, and that the remainder had been destroyed. The bottle was sent to Dr. Hall Edwards, pathologist to the Moseley Drug Stores, and the latter examined the same. The latter found the tincture to be more or less pure, and gave 30 minims of the solution to the coroner and one police officer. The coroner reported that the deceased was suffering from bronchitis, and that he had been advised to take the tincture of lobelia at night. He gave the deceased half an eggcupful of the tincture in a wineglass of water about two o'clock that afternoon. Her daughter had purchased it on Saturday, and only three doses had been used. In answer to the coroner she said she had no idea what the proper dose was. Miss Emma Hackett said that her father had been in very weak health. No law can be made retroactive, hence those in business at the time of the passage of the act must be allowed to continue, but all others desiring registration thereafter should be required by examination to show their fitness. What we need more than any registration upon diplomas is some way of establishing uniformity of requirement by the boards of the entire country, so that a man who is a registered druggist in one state may be allowed to enter business in another without re-examination. Once a druggist always a druggist, and the Maine druggist should be considered competent in California.—Pharmaceutical Era.

The patient was conscious, but seemed unable to speak. He remained in this condition for an hour or an hour and a half, and on the arrival of Dr. Hall Edwards he was dead. He had been taking cough medicine, and tincture of lobelia, the latter having been recommended for the relief of asthma, but the widow assured the jury that the deceased had not taken more than his prescribed dose. She gave him half an eggcupful of the tincture in a wineglass of water about two o'clock that afternoon. Her daughter had purchased it on Saturday, and only three doses had been used. In answer to the coroner she said she had no idea what the proper dose was. Miss Emma Hackett said that her father had been in very weak health. No law can be made retroactive, hence those in business at the time of the passage of the act must be allowed to continue, but all others desiring registration thereafter should be required by examination to show their fitness. What we need more than any registration upon diplomas is some way of establishing uniformity of requirement by the boards of the entire country, so that a man who is a registered druggist in one state may be allowed to enter business in another without re-examination. Once a druggist always a druggist, and the Maine druggist should be considered competent in California.—Pharmaceutical Era.

Continuing, in answer to the coroner, Mr. Newton said leading therapeutists considered lobelia a very safe drug; safe enough to give to babies, and it was not usually taken in water. It was not usual to state the dose in such tinctures; it was not poisonous, except in extreme doses. He quoted from an authority named Ringer in support of his contention, and said it would not be policy on the part of a medical man to tell his patients the name of the article used.—The Coroner: Then you assume that because you give the name of a draught or mixture the patients must judge the quantity they must take?—Witness: I do not say so, it is not a dangerous drug; it is a drug we sell every day regularly, and it is not necessary. There is a Poison Act for chemists to follow, and it is not in the Poison Act. I am not supposed to caution people who buy it.—The Coroner said he was of the opinion that it would have been wiser and better if the witness had cautioned the purchaser, and it was hardly the thing to sell a drug of that nature without putting the dose on the bottle. —The Witness: Well, it is a matter of opinion, it is not the law.—The witness was then examined by Dr. Hall Edwards, with the result that they disagreed as to the properties of the drug, and the doctor holding that it was made with ether, and the chemist, spirits of ether. They also disagreed as to its poisonous qualities, and the witness said that if he recalled any of his drugs for special uses he should be breaking the law, and bring the Apothecaries' Society down upon him—he was a vendor and not a prescriber. Dr. Hall Edwards said that two draughts had been taken from the bottle. The usual dose was thirty drops, and it should, certainly, be taken in water. He was of opinion that death was due to syncope, and was strongly of the belief that lobelia should have been avoided, as it had a depressing effect. He did not consider a post-mortem was necessary. The jury returned a verdict in accordance with the medical testimony.—Birmingham Mail.

THE FOOD AND DRUGS ACT IN YORKSHIRE.—Two reports have been prepared by Mr. Alfred H. Allen, the publicity officer for the West Riding of Yorkshire, for presentation to the County Council of that division, which deserve wide distribution. For the one, an attempt has been made to present statements of fact so important and expressions of opinion so grave that all who are concerned in the working of the Food and Drugs Act should know of them. The reports are scarcely of less importance to the public generally, for they make it known how the law may be evaded to a certain extent, to the detriment of the public, without those who break it being held responsible to the law. The
reports are Mr. Allen’s statement for the last quarter of 1894, and his statement for the whole of that year, and the parts of them which deal specifically with the composition of certain drugs and condiments are given below. Mr. Allen also points out some of the difficulties which a public analyst meets with in the discharge of that part of his duties which brings him into contact with the powers that be. In one instance in which a case was taken, the Board of analyzers, after inspection of the samples, expressed the opinion that the inspector might have been better employed than in going about buying seidlitz powders; and in another case, with reference to butter adulteration, a magistrate made the remark from the bench that he should do everything in his power to prevent the enforcement of “such an iniquitous law as the Sale of Food and Drugs Act.”

In the course of his report Mr. Allen says: “A large number of drugs and remedies of various kinds have been submitted to me. Some of these were of such a character as to make it impossible to give definite conclusions on them. In the case of the preparation purchased under the name of articles described in the British Pharmacopoeia are usually wanting in its definiteness of character as is necessary to enable a public analyst to certify to their adulteration. As an instance, Friar’s Balsam is a useful domestic preparation, which is represented in the British Pharmacopoeia by the compound tincture of benzoin, but I know of no authority which would compel the vendor of an article sold under the name of Friar’s Balsam to comply with the requirements of the British Pharmacopoeia as to the composition and quality of compound tincture of benzoa. To further complicate the question, the British Pharmacopoeia simply prescribes the method of preparing compound tincture of benzoa, but gives no test or character by which its general nature can be recognised.”

On the same subject in his quarterly report, Mr. Allen says: “There is no official recognition of the title of Friar’s Balsam, and in the present condition of the law it would be impossible to obtain a conviction for the sale under that name of an article which was not strictly of the nature, substance and quality of the official preparation. This is a type of numerous other preparations, with which, under present conditions, it is impossible to deal satisfactorily.

“As a further illustration of the difficulties under which public analysts work, I may say that the British Pharmacopoeia, while defining the ingredients of tincture of rhubarb and the strength of spirit to be used in its preparation, gives no test by which a preparation properly made can be recognised. Further, in applying to the official referees, under the Sale of Food and Drugs Act, they professed their utter inability to give me the least assistance in laying down standards or limits of composition for tincture of rhubarb, or any other spirituous preparation, as to be tested in the Somerset House Laboratory. In order to adequately examine the samples of tincture of rhubarb submitted to me, it has been necessary for me to prepare and purchase a number of such preparations, and to devise a method for their examination and examination with a view of comparing the tinctures with those submitted to me by the inspectors. I have thus acquired considerable information on the subject, but am of course liable to have my certificates contradicted at any moment by appeal to the chemists at Somerset House, who may base their opinion upon wholly different data.”

In his analysis of tincture of rhubarb in the last quarter of 1894, Mr. Allen says: “Of various samples of drugs examined, tincture of rhubarb presents the most notable cases of adulteration or deficiency. Not only is a preparation sold which is destitute of safron—required by the British Pharmacopoeia to be used in the preparation of rhubarb tincture, but the percentage of one-quarter ounce to the pint—but the alcoholic strength is frequently deficient, which implies deficiency in the active constituents of the drug. This may be due to the extraction of the drug with too weak a spirit or to an actual dilution of the finished tincture by another. The following table of results obtained shows that he has examined eleven samples of rhubarb and that only five of these were genuine, the other six samples falling in various ways under the description which applies to them above. In the worst case his remarks were as follows: “Extractive matter very deficient in alcoholic strength; destitute of safron.” One prosecution had been instituted against a vendor of tincture of rhubarb deficient in extractive matter and alcoholic strength. The offender was ordered to pay costs.

Dealing with the subject of ground ginger and its adulterants, Mr. Allen says: “The practice of mixing ground ginger with rice gruel, sugar and a percentage of the root has already been exhausted of its properties by the manufacturers of ginger tea. It appears from the number of cases in which such an adulteration has been detected to be widely prevalent. In one instance a sample of ginger tea sent to me was found to contain 7 per cent. of hydrated sulphate of lime. This had been added in the form of fibrous gypsum, the characteristic taste of which was distinctly recognisable under the microscope. In my opinion this addition must have been intentional. I recently collated the results of analysis of 104 specimens of ground ginger, 70 of which I analysed in my own laboratory, and, as a result of those analyses, I obtained an unprecedented amount of information respecting the composition of ginger tea. This enabled me to condemn a sample which contained 5 per cent. of sand and extraneous matter, but my certificate being disputed, the sample was sent to Somerset House. The referee found the presence of sand, but said that the proportion found was not in excess of that which was sometimes met with in ginger root grown as import, and was previously washed. As a matter of fact, the results of my analysis showed that this sand had been washed, but the referees do not appear to have studied this point. As a result, the case was dismissed. As a consequence of the position taken by the referees it will be possible in future to get 5 per cent. of warehouse sweepings or other rubbish into all ground ginger.

Turning to seidlitz powders, Mr. Allen continues: “Of ten samples of seidlitz powders examined, five exhibited very material departures from the composition of the seidlitz powders prescribed in the British Pharmacopoeia, and usually this departure was in a direction of the diminishing of the amount of the active constituent, seidlitz. In my opinion it is of high importance that a seidlitz sold under a definite name should be, as far as practicable, of constant quality and composition. This not always attainable in the case of natural drugs, there is no excuse in the case of preparations compounded of definite chemicals as are seidlitz powders.

ORGANISATION OF MEDICAL ASSISTANTS.—As the purpose of creating an association of qualified medical assistants, junior medical officers and locum tenens was held on March 11 in the Exhibition Hall, Victoria Embankment, Dr. J. C. T. Howard, in his address, gave letters from numerous medical assistants in various parts of the country heartily sympathising with the objects of the gathering, the Chairman pointed out...
the desirability of such an association as was contemplated, bearing in view the many disadvantages with which the ordinary medical assistant had to contend. He pointed out what had already been done by the Medical Council for assistants, whom he estimated to number something like 4000.—Dr. C. Legge thought that one great advantage of the association would be the formation of a bureau for securing appointments and enabling principals to obtain the services of efficient and thoroughly qualified assistants, while it would also help to secure for the latter an improved professional status. A committee for the purpose of receiving communications on the subject and of taking steps to organise the association was then appointed, the names of the gentlemen being: Mr. John W. Oliver (Hoyackney Infirmary), Dr. Probyn (Shoreditch), Dr. Orme (St. Pancras), and Dr. Quarry (Lambeth).—Daily News.

THE PHYSICS AND CHEMISTRY OF DEVELOPMENT.—On Monday, the 11th inst., the first of two lectures on “The Physics and Chemistry of Development,” arranged by the Affiliation of Photographic Societies with the Royal Photographic Society, was given by Mr. T. Bolas, F.I.C., F.C.S., at the Cordwainers’ Hall. Sir H. Trueman Wood presided, and the numerous audience included many well known in photographic circles. The lecture was illustrated by numerous experiments, with the object of showing the analogy between the action of a rapidly alternating current of electricity, and the action of light upon the haloid salts of silver; the light actually producing in the molecules of the silver salt an alternating discharge, and bringing about a condition of electrical tension, the electrical action being continued by the developer until decomposition results. Electrical views of the action of light were first given expression by Dr. J. Schonau in 1853, but were merely verbal suggestions. In 1867 the head of the photographic department of the Russian army expressed the more definite view that an electrical current was generated in the molecules which tended towards separation, but stopped short of actual decomposition. Later experiments by Dr. Lodge in England, and by Hertz in Germany, have proved the correctness of this view. The lecturer, in the course of the practical portion of his lecture, which included the electrolysis of water and other solutions, the lecturer was assisted by Mr. Child Bayley, and images of the various phenomena were projected upon a screen by means of an optical lantern, worked by Mr. R. Beard.

THE PATTERMAKERS’ COMPANY.—On Tuesday evening last, the Master (Major Clifford Probyn, J.P., L.C.C.) and Wardens of the Pattermakers’ Company entertained the Lord Mayor and Sheriff as dinner in the Pillar Room, Cannon Street Hotel. Among the guests were Lord Frederick Fitzroy, Viscount Dungarvan, the Earl of Bute, Lord Selkirk, Earl of Selkirk's, Hon. F. Greville, Mr. Sheriff Hand, Alderman and Sheriff Samuel, Alderman and Sheriff Diment, Major-General J. C. Hay, Sir John B. Monckton, Admiral H. D. Grant, Colonel W. Gascoigne, Mr. H. E. S. Hopwood (Secretary to the Board of Trade), Sir F. Seger Hunt, M.P., Mr. W. H. M. Christie (Astronomer Royal), Mr. T. G. Fardell, M.P., Mr. F. A. Philbrick, Q.C., Mr. W. Grown Cross (Mayor of Shrewsbury), Mr. M. Cartwright (President of the Pharmaceutical Society), Colonel R. E. Edis, Mr. F. C. Coates, Mr. A. J. Anstiss (Master of the Jockey Club), Mr. W. F. Issacson, M.F., Dr. Armstrong (President of the Chemical Society), Mr. T. B. Blackwell (Master of the Sailors’ Company), Mr. H. S. Foster, F.R.S., Mr. W. Emmerson, Mr. Bridewell Carter, Mr. H. Harker, Mr. Barrow Emancipé, Mr. H. L. Buck, Rev.

J. Ker Gray, Mr. J. Walford Warden, Mr. A. J. Baker, Major A. J. Thornhill, Mr. R. Clout, Mr. H. H. Bartlett, Mr. J. A. Brand (Controller), Mr. W. M. Bywater, Mr. Peter Locker, and Mr. C. Fitton (Clerk to the Company). The dinner was served in magnificent style, the menu being as follows:

"Will you please you to fall to."—Richard II., V. 2.

"I pray you, jest, Sir, as you sit at dinner."—T. of Shrews., IV. 3.

Dinner having been concluded and the usual loyal toasts honoured, the Chairman proposed the "Navy, Army, and Reserve Forces," paying a tribute to the present Government for their efforts to maintain the supremacy of the British Navy, Admiral Grant, Major-General Hay, and Colonel Gascoigne responded. The Chairman then proposed "The Lord Mayor and Corporation," and in doing so expressed a hope that if Parliament in its wisdom should amalgamate the Corporation with the government of the greater London the record of the future Corporation might equal the record of the past.—In reply, the Lord Mayor expressed approval of unification, but not of amalgamation. The latter word was not in his vocabulary. The quack doctors who prescribed for the Corporation had just received a prescription of three years' rest, and at the end of that time he hoped the prescription would be continued for a further period. Mr. H. H. Bartlett, past Master, next proposed "The Sheriffs," to which Mr. Sheriff Samuel responded. In proposing "The Pattermakers’ Company and the Master," the Lord Mayor congratulated the Company on having so excellent a master. The toast was drunk with musical honours, and suitably acknowledged by Major Probyn. The other toasts included: "The Past Masters and Wardens," "The Visitors," and "The Clerk." During the evening, under the direction of Wilhelm Gans, an excellent programme of music was given by Mlle. Erna Gelber, Miss Florence Oliver, Mr. Alfred Kenningham, and Mr. Robert de Lacy.

S. M. BURBROUGHS’ MEMORIAL.—It is gratifying to note that a large number of those connected with pharmacy, in the widest sense of the word, have contributed to do honour to the memory of one who was himself a pharmacist, and have handsomely
subscribed to the fund, which now amounts to over £200. Taking this fact into consideration, the Executive Committee are of opinion that the Memorial should not take the form of a local charity, or a charity of a general character, but that it should be connected with pharmacy, especially as in the neighbourhood of Dartford ample provision will be made to ensure the remembrance of Mr. Burroughs’ good deeds, a collection being made in that district for the purpose of subsidizing the Dartford Cottage Hospital, in which the deceased took such great and active interest. The Executive Committee is, therefore, of opinion that the memorial should be connected with pharmacy, and that the memorial should take the form of a Burroughs’ Scholarship connected with pharmacy, or that a Burroughs’ Benevolent Fund connected with pharmacy should be founded, the administration of which should be offered to the Council of the Pharmaceutical Society of Great Britain. This being the case, it is hoped that chemists will freely respond to the appeal and send in their subscriptions, as by doing so they are at the same time helping to advance the interests of their own profession. Information will be given by H. Habling, Hon. Sec., 63, Queen Victoria Street, London, E.C., and subscriptions should be sent to John Moes, 39, Tressillian Road, St. John’s, London, S.E.

Sheffield Microscopical Society.—A general meeting of this Society was held on Friday last at the Rutland Institute, Fargate. There was a good attendance of members and friends, Dr. Hall, B.A., occupied the chair. Mr. J. Newton Coombe gave a lecture on “Modern Microscopy,” illustrating it throughout with specially prepared lantern slides. The principles of optics, such as the propagation of light, its velocity, the principle of Huygens, shadow theory, reflection and refraction, were explained in a most interesting style by the lecturer. The various lenses were next considered, and a short history was given of their past and present development and the manner in which they are manufactured and put together. The human eye and its wondrous mechanism—the favourite looking ground of all microscopists—was fantastically set forth by Mr. Coombe’s most becoming style. The artificial optical instrument—the microscope—occupied the remainder of the evening. All the best makers of modern microscopes and their accessories were noticed and commented upon. The best methods of illuminating, measuring, and camera lucida drawing were also experimentally demonstrated. A hearty vote of thanks was accorded the lecturer on the withdrawal of Mr. Hoole, seconded by Mr. Austen. Afterwards Dr. Hale showed the “Artificial Spectrum Top” made by Newton and Co., which was the means of pleasing not a few of the members.

Pharmaceutical Football Club.—A match was played on Saturday, March 3, between the Pharmacists and the Manchester Boilermakers, the former, which ended in an easy win for the home team by three goals to one. Next Saturday’s match with the Breweries will be the last of the season for the Pharmacists, so those interested in the club should not miss seeing it. The last match between these teams resulted in a draw—one goal each.

Press Comments.

Salt Mines of the Punjab.—The range of the salt hills of the Punjab extends from the town of Thalum eastward to Khalaebeg on the Indus. There is a salt range extending beyond Khalaebeg, across the Indus, but the salt is of a different age and position. Khewra is the name of the village where the most important of the mines are worked. These are called the Mayo salt mines, in honour of Lord Mayo, who visited them when Viceroy of India. The only inhabitants of Khewra are those whom the work caused with the mines renders necessary, but a grand communication with Thalum and Lahore, a recent report from India, states that the deposit is large and detached, and is called Warthaghri depot. The Mayo salt mines are not in the sense of being far beneath the surface of the ground,—like a coal mine, for instance. At the bed of a high, rugged hill there are three open, like the mouths of tunnels, and through these the visitor may walk or be carried on trellises, accompanied and guided by miners with torches and earth-sauce lamps, called dikes, to light upon the encircling darkness. When the visitor overcomes first sensations of novelty and bewildermess, he begins to see and know nothing but salt, salt roof, salt floor, salt walls, all blackened and begrimed with the salt from torches and dikes. Sometimes, at short intervals, large recesses, called “stations,” when ready for removal is collected, are met with. The salt is rock salt, and is obtained first by blasting and then by cutting with a rough pick. The miners are accustomed to the work that the little dikes are as the light they require, and the neatness and regularity with which the walls of the chambers are remarkable. These chambers are immensely large, one of them being 350 feet long and 200 feet wide. The salt obtained is generally of a pink colour, sometimes of a dirty or muddy pink. Natural salt is to be found in almost every colour—red, brown, green, blue, etc.—but at Khewra the prevailing colour is pink; the transparent crystal salt is also found, solid, rectangular block of 37 cubic feet, and was two tons, sent to the Vienna Exhibition of 1893.

The quantity of salt in the Khewra range is said to be practically inexhaustible. It has been calculated that if an average thickness of only 135 feet wide and 136 feet thick of salt be assigned to the salt beds, the in the 130 miles along which these seams may be 300 miles by 3 miles by 350 feet of beds, the total amount of the salt in the 290 miles by 10 feet which is left, the amount of the salt in the beds of the three ranges is nearly 16,000 miles. For the quality, it has been stated that salt is of a purity such as few salt mines of the sort can yield.—Journ. Soc. Arts.

Poisoning by Carbolic Acid.—Statistics based upon deaths by poisoning are a subject of annual mention in Great Britain, where the Registrar-General is charged with the duty of carefully collecting and tabulating such matters for England and Wales. In figures recently presented bearing upon deaths by poison during 1893 are quite significant, and is an absence of similar records in this country may have, with profit, as similar conditions undoubtedly exist in this country. The figures for 1893 show that the sales of carbolic acid probably not be explained through increase in population, and partly through some detail in collection of statistics, but a figures upon suicide indicate that the portion of a population which thinks life not worth living is increasing faster than conditions of natural law warrant. For 1893 the cases are 368, an increase of 67 over 1892, 41 over 1891, and over 1889, and what gives the figures for 1893 point of interest is the fact that 117 persons out of the 368 took their lives by means of carbolic acid. The highest number (59) chose opium and its products, and 560, acetic acid; 118, nitric acid; 17, phosgene; 30, peroxide of hydrogen, and 41, ethyl alcohol. The druging figure in the returns is 150, the number of the number of the

No. 4179.—An improved apparatus for effecting the cooling of liquids. February 26, 1886.

No. 4194.—A new substance for the cure of toothache and the like. February 27, 1886.

No. 4240.—Improvements in the wiring of corked bottles and apparatus therefor. February 27, 1886.

No. 4252.—Improved coin-free apparatus for delivering liquids. February 27, 1886.

No. 4277.—Improvements in photographic cameras. February 28, 1886.

No. 4299.—Improvements for securing hermetically the stoppers or covers to jars, bottles, and other vessels. February 28, 1886.

No. 4327.—A new lotion for outward application for the cure of scabs, scrofula, blitotis, and other like skin diseases. February 28, 1886.

No. 4355.—Improved apparatus for measuring liquids. February 28, 1886.

No. 4431.—An improvement in or relating to appliances for distributing perfumes, antiseptic, and like essences or extracts for disinfecting purposes. February 28, 1886.

No. 4451.—Improvements in photographic plate-holders. March 1, 1886.

No. 4492.—Improvements in photographic film-holders. March 1, 1886.

No. 4496.—A new or improved medical preparation for human use. March 1, 1886.

No. 4678.—Improvements in medical appliances. March 2, 1886.

No. 4606.—Improvements in apparatus for heating oil or other liquids. March 2, 1886.

No. 4614.—Improvements in sterilising and purifying liquids. March 2, 1886.

**Patents Published March 2nd.**

**Artificial Legs (Judd, A. T.).**—The invention consists in the application of an indiarubber buffer to the artificial leg to prevent jarring in walking. No. 2976 of 1884.

**Deserting Lead (Swan, J. W.).**—The lead is run in a fine divided condition or dust, so that it floats upon a layer of lead. No. 3076 of 1884.

**Treatings Gout, etc. (Zimmermann, A.).** A communication from the Chemische Fabrik auf Actien, of Berlin.—The invention comprises the use of various organic bases in place of lard, etc., for the treatment of uric acid diathesis. Piperazine is said to have given the best results. No. 3228 of 1884.

**Bottles and Stoppers (Mourey, F.).** The neck is provided with a lip, and the stopper consists of a hollow plug with one side cut down so that the liquid may be poured out without removing the stopper when the latter is moved into a certain position. No. 3789 of 1884.

**Solder for Aluminium (Taylor, B.).** A solder for aluminium and aluminium alloys, is prepared by alloying...
together in a stated manner, 12 parts of silver, 4 of copper, 8 of aluminium, 8 of zino, 2 of lead, and 70 of tin, all by weight. No. 7368 of 1894.

Morgan (F. E., A.M., W. A., and Burgum, W. H.).—For purposes where a coating of an alloy rich in an expensive metal is required, it is common to first coat the article with an alloy poor in the expensive metal and to finish off with a coating of that metal or of an alloy rich in it. The invention relates to the deposition of alloys of platinum, iridium, palladium, etc., with tin, cadmium, nickel, cobalt, copper, aluminium, zinc, etc., and comprises various mixtures for the electrolytic bath from which coating is to be obtained. Any desired combination of the rare and baser metal can be deposited. The temperature employed for most of the baths is 90° F. The anode may be of the rare or baser metal, or of the baths, or may be of iron, the solution being kept up to the required composition as deposition goes on. No. 7368 of 1894.

Refrining Butter, Lard, Oils, etc. (Mills, B. J. B. A communication from Campbell, J. H. and C. H.).—Rancid butter, lard, cocoa-nut oil, cotton-seed oil, etc. are refined by alternately blowing air through them while melted, and passing a stream of water through. The air desodates the albuminous bodies to which the inventors attribute the ill odour and flavour, so that they are in a fit condition for being washed away by the water. No. 15,880 of 1894.

Hair Wash (Haddan, H. a communication from Bouffard, J. de).—A preparation for dressing the hair is prepared by grinding 1 part of glue, 1 part of oaken wine, and 1/4 part of a vegetable oil such as oil of almonds and 1/100th part of potash or soda. No. 19,808 of 1894.

Softening Water (Brothers, W.).—Comprises the use of hydramum carbonate "dissolved in hot or boiling water.” No. 10 of 1895.

Inward’s Bed (Payne, G., Scott, J., and Hill, D. L.).—The invalid lies upon a canvas stretcher upon the bed proper, various Rachel and other arrangements serving for a second position. No. 117 of 1894.

Musick (Malman, W.).—The inventor states that by nitrating various ketones (see specification No. 4018 of 1894) a series of bodies possessing the odour of musk may be produced. As an example, he describes the nitration of the ketone obtained by treating butyl-xylol with acetic chloride and aluminium chloride by Friedel and Crafts method. It is introduced into ten parts of ice-cold fuming nitric acid of 1/15 sp. gr., and then the nitroso "mass" is poured upon ice. The nitro-ketone (dinitro-methyl-aceto-phenone) is washed with water and soda solution, and crystallised from alcohol. No. 417 of 1896.

PATENTS PUBLISHED MARCH 9TH.

Lead Oxides (Ferranti, S. Z. de, and Noad, J. H.).—The invention comprises arrangements for producing litharge and red lead by passing the liquid in a finely divided condition, as in the form of spray, into a heated chamber through which air or oxygen is passed. A better quality of oxide is obtained by using lead carbonate instead of the metal. When red lead is being prepared, the product obtained may be passed through a second and third treatment. No. 3373 of 1894.

Disinfectant (Stephens, B. J., and Hewes, J.).—A disinfectant and deodorant for urinals, etc., is prepared by mixing stated proportions of "Crock" lime, oak or other wood charcoal, alun, and cæcyan. Either the alun or the camphor may be omitted from the mixture. No. 5050 of 1894.

Respirator (Bennett, P.).—The respirator fits over the mouth and nose, and has a separate inlet and outlet. Valves are so arranged that the indrawn air travels the filtering or disinfecting medium used with the respirator, while the exhaled breath escapes without passing through such medium. No. 6829 of 1894.

Notes and Queries.

ICE SUPPOSITORYS. (809.) The use of conical ice suppositorys, per rectum, has recently been recommended by two professors in the Military Academy of Medicina, St. Petersburg, in cases of cancer, ulceration, ulcerous diarrhœa, hemorrhoids, etc., as well as in cases poisoning by opium, chloroform, or alcohol. The suppositorys contain the equivalent of a fluid ous of water each, and from two to ten are used daily. They are said to relieve pain, itching, etc., lower temperature in fever, and by reflex action stimulate the heart and the respiration (Modern Medicine, iv. 12.)

MARCHAND'S PEROXIDE OF HYDROGEN. (810.) This solution is said to be free from chloride, to require not more than 2 C.C. normal alkali to neutralise the free acid in 100 C.C., and to contain at least 15 volumes of available oxygen. It is supplied only in 1/2 lb., 1 lb., and 11/2 lb. bottles, at the price of £1.00 per pound, and is best used, the dilution with water, in the form of a spray.

STER. VIT. IDEAL. (811.) This preparation is probably similar to Sirupus Myrtillus of the Germans and Sirup d'air lilie of the French, the juice of the cowberry being substituted for that of the bilberry. The properties of the two are said to be practically identical. The syrup may be prepared by expressing the juice of the biltes, allowing it to stand for some time at a temperature of 30° C., and after filtering, when each 350 Gm. add 650 Gm. of sugar, so as to make 100 Gm. of finished product. The French syrup is used by dissolving 8 Gm. of Estrait d'air lilie (prepared by evaporating the fruit juice to a pflaster or salve) in 1 kilo of bolling syrup.

REMEDY FOR INSECT STINGS. (812.) The Medical Chronicle gives the following formula for a paint for the stings of insects, the being to keep ammonia, hypochlorous in close and prolonged contact with the affected parts:—B. Aq. ammonium, m. d. collodium, gr. i.; acid salicylic, gr. v. A few drops are applied to each bite or sting.

STAINING FRESH TUBERCULAR SPUTUM. (813.) According to Kanzhuck and Dryselaar, a thin layer of the sputum should be poured into a glass dish placed on a dark background, and one of the characteristic yellowish particles picked out with a pair of fine-pointed forceps. This should then be squeezed between two clear cover-glasses, the flat surface are then passed through the flame of a spirit-lamp or Bunsen burner. The glasses may then be floated on a wash carbol-fuchsin solution for two or more times as rapidly in water to remove excess of fuchsin, decolourised in 25 per cent. hydrochloric acid, washed in 60 per cent. spirit till no more red comes off, washed in water, remove spirit, dried between filter paper, and again passed through the flame three times. Next stabs a Löffler's methylene blue for ten to twenty seconds, wash once more in water, dry between filter paper, and again pass through the flame. The cover-glass is held in a pair of forceps, successively from one end to another, the effect being both of time and material.
Novelties.

NEW AUTOMATIC STILL AND EXTRACTION APPARATUS.

This apparatus consists of two cylinders (Fig. II.), one of which fits into the other. For the distillation of water, the liquid is poured into the lower cylinder up to the level of the tap L, and then heated. The water supply is connected with the tube D, and the cold water allowed to run into the refrigerator in the upper cylinder. On heating, the steam given off is condensed on the cone BB, and the drops of distilled water trickling down collect in a gutter and run out by the tube C. By opening the tap E, so as to allow water from the refrigerator to flow into the funnel C, the level at A is kept constant, any excess overflowing from the tap L, and the operation thus becomes automatic. If perfumed waters are required, a sieve H (Fig. III.) is placed on the supports O (see Fig. II.) and the flowers, etc., are placed thereon, so that the steam extracts the perfume in its upward passage. Alcohol, ether, and other volatile fluids may be distilled by inserting the water bath G (Fig. III.) in the upper cylinder, connecting a funnel (not shown in illustration) above the flange J with a vessel containing the liquid, and then proceeding as before. The still is patented, and the agents are Messrs. Butler, Jones, and Durholdt, 140, Leadenhall Street, London, E.C. It is made in four sizes, distilling 1, 2, 3, and 4 litres of water per hour, respectively, and is constructed of solid copper, tinmed inside. The apparatus should prove extremely useful to pharmacists and chemists.

Poisoning Cases and Inquests.

Laudanum.—George Clarke, aged 37, died at Eastbourne on Saturday, March 2, from the effects of laudanum, accidentally administered by himself. Verdict: “Death was caused by the accidental taking of laudanum.”—Bournemouth Observer.

Osicol Acid.—Alice Western, aged 29, died at Hartford Place, Tottenham Court Road, London, on Saturday, March 2, from the effects of osicol acid, self-administered. Verdict: “Suicide whilst of unsound mind.”—Echo.

Carbolic acid.—Isabella Cartwright Pratt, aged 22, died on Saturday, March 2, at Bilton, from the effects of carbolic acid self-administered. During the evidence heard at the inquest held on Monday, March 4, a juryman noticed that the bottle had no label “poison” upon it, and asked whether it was usual for carbolic acid to be sold without a label? The coroner replied that he had seen carbolic acid sold in Wolverhampton without being labelled, but not of that strength. Dr. Smith also said that he quite agreed with the juryman that carbolic acid of that strength should not be sold without a label. Verdict: “Deceased poisoned herself by taking carbolic acid, but that there was not sufficient evidence to prove the state of her mind at the time.”—Wolverhampton Express and Star.

Spirit of Salt.—John Hopewell, aged 55, died on Saturday, March 2, in the General Hospital, Nottingham, from the effects of spirit of salt, self-administered. Verdict: “Suicide whilst in an unsound state of mind.”—Nottingham Guardian.

Prussic Acid.—Henry Beardmore Smythe, a medical assistant, died on Saturday, March 9, at Poplar, from the effects of prussic acid, self-administered. Verdict: “Suicide whilst of unsound mind.”—Echo.

Laudanum.—Isabella Jane Kynoch, aged eighteen months, died at Methlick, on Thursday, March 7, after swallowing a quantity of laudanum.—North British Daily Mail.

Carbolic Acid.—George Haly, aged 50, died on Thursday, March 7, at 76, Lady Somerset Road, Kentish Town, from the effects of carbolic acid, self-administered. Verdict: “Suicide whilst of unsound mind.”—Standard.

New Companies Registered.
[Compiled from the Financial News.]

AUSTRAL VENTURE SYNDICATE, LIMITED.—Registered by Hepburn, Son, and Catchiffe, Bird-in-Hand Court, E.C., with a capital of £50,000 in £100 shares. Object, to acquire mines, mining rights, metalliferous, and other land, and to carry on the general business of a mining, milling, and smelting company in all its branches; to establish and carry on electrical, chemical, and other works in Australia or elsewhere; to acquire, develop, and turn to account land by planting, draining, farming, etc.; to construct and maintain rail and tram roads, waterworks, telegraphs, telephones, and other public works; as bankers, company promoters, dealers in gold, silver, diamonds, etc.; as brickmakers, ship-owners, carriers, hotel keepers, printers; and to carry on all kinds of insurance business, except life assurance. The signatories are:

<table>
<thead>
<tr>
<th>Shareholders</th>
</tr>
</thead>
<tbody>
<tr>
<td>W. Trubshawe, St. Benet's Place, E.C.</td>
</tr>
<tr>
<td>J. Catchiffe, The Adams Court, E.C.</td>
</tr>
<tr>
<td>L. E. Bell, Drapers' Gardens, E.C.</td>
</tr>
<tr>
<td>F. W. Bridgford, E.C.</td>
</tr>
<tr>
<td>J. V. Loy, The Adams Court, E.C.</td>
</tr>
</tbody>
</table>

The first directors—to be not less than three nor more than six—are to be elected by the signatories. Qualification: five shares. Remuneration, £250 per annum and a percentage of the profits, divisible. Registered office, 6, St. Benet's Place, E.C.

CONSOLIDATED ESTATES OF CAPE COLONY, LIMITED.—Registered by Bellens and Co., 23, Great George Street, Westminster, with a capital of £1,360,000 in £1 shares. Object, to acquire, by purchase or otherwise, any farms, lands, buildings, or other property in South Africa or elsewhere, and to develop and turn to account the same; to search for and recover marketable diamonds, gold, silver, coal, copper, plumbago, guaymas, manganese, etc., and as miners and smelters generally; as farmers and graziers, stock raisers, fruit growers and preservers, wine and spirit merchants and distillers, warehousemen, carriers, shippers, engineers, etc.; to lay out towns, to construct and maintain rail and tram roads and other public works. The signatories are:

<table>

<tr>
<td>I. H. Hiley, Grange Lea, Sutton, Surrey</td>
</tr>
</tbody>
</table>

The first directors—to be not less than five nor more than nine—are to be elected by the signatories. Qualification, £500. Remuneration, so long as there are five directors, £400 per annum, divisible, with an additional £250 per annum for each director over five.

SOUTH AFRICAN SALTZETER FIELDS, LIMITED.—Registered by Barrand, Regge and Jupp, 7, St. Mildred's Court, Poultry, E.C., with a capital of £750,000 in £1 shares. Object, to adopt and carry into effect an agreement expressed to be made between J. H. King of the one part and each of the other part, and to examine, prospect, explore, and survey mines, land, and other property; to search for minerals, metals, precious stones, and other products—in particular, nitrate of potassium; to deal in manufactures of nitrate of potash, nitrate of soda, saltpetre, sal ammoniac, etc. The signatories are:

<table>
<thead>
<tr>
<th>Shareholders</th>

<tr>
<td>A. Jackson, 5, Football Buildings, E.C.</td>
</tr>
<tr>
<td>E. H. F. Barrand, 7, St. Mildred's Court, E.C.</td>
</tr>
</tbody>
</table>

There shall not be less than four directors; the first are to be elected by the signatories. Qualification, 300 shares. Remuneration, £2500 per annum, divisible.

FIELD, BREEKE AND CO., LIMITED.—Registered by Kerr and Lanham, 3, Chichester Bente, W.C., with a capital of £2000 in £1 shares. Object, to acquire and carry on the business of a chemist and druggist as hitherto carried on by J. A. E. Breece, under the style of H. E. Field, at Birkenhead. The vendor is the first managing director. Registered office: 70, Exton Road, Birkenhead.

Personal and Trade Notes.

Messrs. Blondean et Cie, of Ryland Road, draw our attention to the fact that in their advertisement on page 5 of last week's Journal a mistake occurs. The words "in any of the Vinolia Preparations," which occur in the last paragraph, should have commenced a fresh sentence.

Mr. W. F. Wyley, of the firm of Wyleys, Limited, Coventry, has been elected County Councillor for the Walsgrave division of Warwickshire.

In consequence of the death of Mr. Maurice Zimmermann, of the firm of A. and M. Zimmermann, Cross Lane, E.C., on Feb. 26 last, Mr. August Zimmermann was left sole proprietor. He now announces, however, that he has taken into partnership Mr. Charles Maurice Zimmermann.

Mr. A. P. Barnard, chemist, Columbia Road, K, divisional secretary for South West Bethnal Green, a member of the vestry and of the Board of Guardians, has been elected unanimously by his colleagues, the guardians, as their representative upon the Asylums Board for the ensuing three years.

The business carried on by Mr. O. Robertson, chemist and druggist, Bridge of Allan, will be continued under his name by his nephew, Mr. John Bain, pharmacist, chemist, who has been principal assistant in the shop for several years.

Obituary.

Notice has been received of the death of the following:

On March 2, Oswald Robertson, Chemist and Druggist, Bridge of Allan, N.B. (Aged 66.) Mr. Robertson went to Bridge of Allan thirty-three years ago, and since that time he has done much to improve the appearance of the village. Mr. Robertson took a very active interest in public affairs. For some time he was chairman of the late Curling and Skating Company, and for two years was hon. president of the Bridge of Allan Football Club, and at the time of his demise he was a Justice of Peace for Stirlingshire, a director of the Gas Light Company, of the Mineral Water Company, of the Water Company, and a member of the Macharlane Trust, as well as the Public Amusements Committee. His illness was of a chronic character.

On March 7, Charles Thomas Pearson, Chemist and Druggist, London. (Aged 63.)

On March 9, Thomas Evans, Chemist and Druggist, Burnley. (Aged 47.)

On March 10, William Blankley, Chemist and Druggist, Arnold. (Aged 60.)

On March 10, William Mead, Chemist and Druggist, Hemel Hempstead. (Aged 66.)

Publication Received.

Market Report.

Chemicals and Drugs.

THE CHEMICAL MARKET.

THURSDAY, MARCH 14, 1895.

Since our last there has been but little business passing in the Chemical Market, and prices remain much the same as last week, and the market is quiet, with small advices; there is no material depression in prices. Citric acid is firmly held, but quotations are unchanged, whilst a fair amount of business has been done in tartaric acid, which closes steady at last week's rates. Oxalic acid continues fairly steady, whilst of ammonia compounds, sulphate has been a very weak market during the week, the quotations being continued on the down line. Carbonate of ammonia and sal ammonia are unchanged. Arsenio is still in but moderate supply, and quotations are well maintained. Ashes are steady, whilst borax remains a weak market, the prices accepted by second hand-holders being still below those fixed by the Syndicate. Copper sulphate presents a steady market at unchanged rates, this also applying to cream of tartar, which is maintained at last week's rates. Murcurials and quicksilver are unchanged. Potash and soda compounds are all quiet, with the exception of "hypo," in which a fair amount of business has been passing lately, although supplies are but poor.

ACID BORIC ACID.—Crystals quoted at 90s., and powdered at 81s. 6d. ACID CITRIC.—Little business done, as holders are firm at unchanged rates. Quoted at 1s. 14d. to 1s. 16d. accordingly the quality. ACID INVALID.—Unchanged, with a fair amount of business being done. Quoted at 6s. 3d. net ex works.

ACID TARTRA.—The demand continues fairly brisk both for foreign and English makers. Quotations of English makes are 10½d. to 11d. Foreign ditto, both powder and crystal, 10½d. ACID TARTRIC.—Quotations remain firm, but the supply is not so large as it was not long ago. The market has been very weak, with prices continually depreciating. At the close it is quoted 2s. 6d. for grey and 2s. for yellow. It has not been offered by the fall in sulphate, and last week's quotation of 3d. to 3½d. still holds. SAL AMMONIAC.—Unaltered; the quotation for first quality is still 8d., with seconds at 7½d. ASHES.—Rather scarce, and demand is steady. Prices returned are still 42s. 6d. for Americans, with pot at 28s.

AMMONIA.—Some business but small, and prices are well maintained. Quoted at last week's rate of 1s. 9d. to 1s. 10d. for powdered white.

BLEACHING POWDERS.—Fairly brisk, at unchanged rates. Quoted at 8s. 6d. to 9s. 6d.

BORAX.—Continues to be a very weak market, with second hand-holders selling fully 6d. per cwt. lower than the Syndicate. Quotations are still 10s. 6d. with crystals, with 9½d. powdered.

 COPPER SULPHATE.—Demand continues good with unchanged quotations. Still worth 5s. 17½d. to 6s. 0d., according to brand and condition.

CREAM OF TARTRAR.—The market still shows the improvement noted last week, and the quotations are very fairly maintained. Pepsiculina is firm. Since the last auction sales have been made privately, both in Rio and Carthagena root, at fairly steady rates. Japal is lower, fair Vera Cruz being off red privately at a decline of 2d. to 3d. Menthol is firm at unchanged rates. Of the essential oils aniseed is dearer, holders seeking for an advance of 2d. to previous quotations, whilst cassia is very easy at a fall. There has been a steady demand for opium, which is quoted at unchanged rates. Oily and solid kerosene is easy. In quinins a fair amount of business has been done at steady rates.

ALOE.—The market is firm at unchanged rates for all qualities of Cape, whilst Curacao is steady for good grades.

BUCHU.—Since the auctions there have been sales of fair bright green leaves at 3s. 6d.

CAFFRE.—Remains steady at unchanged rates, 1 cwt. lots are quoted at 15s.; 28 lbs. 15s. 6d., smaller quantities at 16s. 6d. (crude) remains quite at easy rates; and the business has been done at the quotations given. Jupes is offered to-day at 9s. c.i.f. terms, whilst Chinese camphor is quoted at 35s. 6d. c.i.f. distant shipment, whilst on the spot Japanese is held at 10s. 6d., and Chinese at 10s. 6d.

CAMPFUR (Refined).—Last week’s quotations are unchanged, but the market is quiet, demand and supplies in looks and flowers are still returned at 1s. 5d. for 10 cwt. lots with 1s. 6d. for smaller quantities, and prices at proportionate rates.

CHILLIES.—Very fair, some business being bought in at 28s., with good bright Sierra Leone at 31s.

CLOVER.—Zeylan were in but small supply at the auctions, whilst good fine bright fruit is still at 2s. 6d. per cwt. with premium. Salmon pink is quoted at 5½d without reserve. Quotations for Zanahory for delivery are unchanged at 5½d. April to June.

COFFEE.—Is very steady, 118s. 6d. nominally, and is firmly held at that rate. As the stocks of crude cacao are, however, but small, a further advance in the price of the bulk is probable.

COCAINE.—Steady, at 12s. 10d. to 12s. 15d., with second-hand holders quoting at 12s. 15d.

COPROLITE.—Continues firmly held at 1s. 6d.

CORAL.—Marquesan is steady at 1s. 7d. (Bahia) 1s. 6d. to 1s. 8d.

Fucus.—A fair amount of business has been done since the auctions last week, and sales at 5s. 6d. per cwt. in Rio and Cartagena with firms with firm closing quotations. Prices.—Brasilian (Rio): Good to fine annulated, 4s. 6d. to 5s.; fair, 3s. 6d. to 4s. 6d. Columbus (Argentina): Fair first-class damaged, 8s. 6d.; second ditto, 7s. 6d.

JALAP.—Is lower by 2d. per lb. Privately, fair Vera Cruz is quoted at 1s. 14d.

MENTHOL.—Is steady at unchanged rates. The best brands are quoted at 15s. spot for good white crystals, whilst forward rates are 1s. 16s. to 1s. 20s. At the terms.

MORPHINE.—Unchanged at 5a.

OLIVE (Essential).—Prices are dearer, privately 5a. 10d. has been bid and refused, holders seeking 5a. 11d. to 6a. forward quotations are 6s. 11d. c.i.f. China is easier. It is quoted on the 2nd of this month at 5½a. 6d. to 5a. 10d.

PECHIGA.—Heichka's brand is a trade easier at 9s. 6d. Japanese oil, 40 per cent. remains steady at last week's rates of 8s. 6d. to 9s. with demarcelled oil at 7s. 6d. to 8s. 0d. Lemon oil, 4½a. a fair quotation in b. f. for a brand of guaranteed purity would be 2s. 6d. Lemongrass: Dull and but little business doing, at 1½d. to 2d. per cwt. All trials are seeking the necessary papers to be shown during the past fortnight having been merely caused by the epidemic. Good Sidney oil is quoted at 1s. 6d. to 1s. 7d.

PIRITUS.—(Ferrous) AMERICAN and SINGAPORE are the most popular at present time. The peak prices have been gradually tending lower, and finest non-conning new oil is quoted at 10s. per barrel of 58 gallons, C.I.F. terms, whilst prime old oil is worth 10s. 0d. Licensed has shown a very steady market during the week, and prices have been steady on the rise. At the close it is quoted at 1s. 10s. to 2s. 0d. with fair nicely steady and the market is very easy at quotations of 1s. 10s. to 1s. 17½s. according to brand. Ee-e-n-o: Quiet. Ceylon is quoted 2s. 3d. to 2s. 5d. and Russian is quoted 2s. 10d. to 2s. 12½d. fairly steady at unchanged rates. Refined oil is worth 2½s. 6d. to 2½s. Turrpens still continues to be steady at 3s. 6d. per cwt. and the average price at 5½d. to 6d. on last week's quotation. Price for American spirit is now 2s. 6d. Petroleum: Remains firm at last week's quotation at 2s. 6d. per cent. Russian at 2s. 3d. Petrolem Spirit: Ordinary, 7d.; deodorised, 7½d. to 7½d.

QUININE.—Business has been at last week's rates. Quotations.—Turkey: soft shipping description, 12s. to 15s. 6d.; best druggists, 10s. to 10s. 6d.; second ditto, 9s. to 9s. 6d. Persian, 12s. to 15s.

PILGRIM.—Continues very scarce, and quotations are well maintained. Hydromeloshis and Nitrous are very steady at 7s. to 8s. 6d. per cent.

QUININE.—A fair amount of business has been done during the week at steady rates. Dravessic has been selling at 11½d., and there are close there this morning. A German makes at 11s. 9d.

SHELLAC.—The demand is very poor, but prices are steady in spot of the unimproved and others. Some Roman dye sales of T.N. Orange very steady on the basis of 10s. have been made, with fair A. C. Garnet quoted at 10s. 0d. Remains very dull at low quotations fair China being worth 10d.

TALC (Besse).—Very steady. Jamaica wax is worth 8s. 10d. to 9s. 10d., with Madagrasque at 8s. 2d. to 8s. 10d.}
Diary of the Week.

[Notices for insertion under this heading should reach the Editor on or before Wednesday.]

SATURDAY, MARCH 16.
Pharmaceutical Society, Burlington House, at 8.30 p.m.
"Chemical Society, Burlington House, at 8 p.m.
"Some Oxypridines Derivatives," by Miss Sedwick and Dr. Collie.

FRIDAY, MARCH 29.
Pharmaceutical Society of Great Britain, at 8.30 p.m.
"Discussion on the proposed 'Imperial' Pharmacy Bill," by Sir Robert Reid.
Royal Institution of Great Britain, at 8 p.m.
"Emlyn Bronte," by Sir W. Wynn Reid.
Sheffield Microscopical Society, at 8.30 p.m.
"The Micro-structure of Steel," by Professor Arnold.

SUNDAY, MARCH 17.
Sunday Lecture Society, at 4 p.m.
Sunday Lecture Society, at 4 p.m.
Silver from Clay: the remarkable story of the metal aluminium (Illustrated), by W. Mayhew Heller.

ROYAL INSTITUTION OF GREAT BRITAIN, at 8 p.m.
"The Internal Framework of Plants and Animals," by Professor Charles Stewart.
"Practical Carpet Designing," by Alexander Millar.
"Institution of Civil Engineers, at 8 p.m.
"Ordinary Meeting."
"Aberdeen Chemists' and Drugists', Assistants', and Apprentices' Association, at 9.30 p.m.
Paper by James Clark.

WEDNESDAY, MARCH 30.
Imperial Institute, at 8.30 p.m.
"Ladies' Concert."
"Geological Society of London."
"Special General Meeting at 7.45 p.m.
"The Jibsonian of the Mid-Ottawa Council," by Sir S. Buckman, at 8 p.m.
"On Fluor-gallic and Inter-gallic Deposits in Switzerland," by C. S. de Biche Preller.
"Royal Microscopical Society, at 8 p.m.
"Patents connected with the Microscope from 1666 to 1800 A.D.," by W. H. Brown.
"Society of Arts, at 8 p.m.
"Pharmaceutical Society and Cricket Club, at 7 p.m.
Annual Dinner to be held at the Queen's Hall, Holborn Restaurant.
"Western Chemists' Association (of London).
"Edinburgh Chemists', Assistants', and Apprentices' Association, at 9.15 p.m.
"Communications by W. F. Hay, Alex. Murray, and J. H. Burns."
"Sheffield Pharmaceutical and Chemical Society, at 8.30 p.m.
"Recent Research in the Micro-Structure of Steel," by Prof. Arnold.

THURSDAY, MARCH 21.
Royal Institution of Great Britain, at 8 p.m.
"Imperial Institute, at 4.30 p.m.
"Indigo and its Modern Substitutes," by Professor J. J. Hummel.
Linnean Society of London, at 8 p.m.
"Chemists' Assistants' Association, at 8.30 p.m.
"Sanitation," by E. Goulding.
"Liverpool Pharmaceutical Students' Society, at 8.30 p.m.
"Dispensing Notes," by E. Walker.
"Digestive Ferments," by Edwin Williams.
"Gloucester and West of Scotland Pharmaceutical Association, at 9.15 p.m.
"Pharmacy Notes," by R. Brodie.

Chemical Society, Burlington House, at 8 p.m.
"Some Oxypridines Derivatives," by Miss Sedwick and Dr. Collie.

ROYAL INSTITUTION OF GREAT BRITAIN, at 9 p.m.
"Emlyn Bronte," by Sir W. Wynn Reid.
"Sheffield Microscopical Society, at 8.30 p.m.
"The Micro-structure of Steel," by Professor Arnold.

ROYAL INSTITUTION OF GREAT BRITAIN, at 8 p.m.
"Waves and Vibrations" (Fourth Lecture), by Sir J. Rayleigh.
"Visit to the Museum of Practical Geology, Jess Street, W.

Exchange.

[Notices of books, apparatus, etc., for exchange, excluding thirty words, including names and address are inserted free, but must not take part of the nature ordinary advertisements.]

OFFERED.
Books.—Woodville's 'Medical Botany, 1st edition newly re-issued, 50s.; 'Ph. Londoinesis, 1858, unimproved, perfect condition, 6s.—Brown, Chemist, Ampthill.

WANTED.
'THE ANALYST.—Volumes or numbers from 1855 to inclusive. State prices, which must be moderate, to care of J. Robinson, 125, South Lambeth Road, S.W.

Trade Mark Applied For.
[Compiled from the Trade Marks Journal.] 185,294.—WHITE JAP BIRD-LIME, with device of a leaf attached to a branch of a tree.—Kay Brothers, Limited, St. Peter's Mill, Stockport, Cheshire, Feb. 1, 1890. The essential particular is the device.

Late Advertisements.

Assistant Wanted.

QUALIFIED Junior Assistant wanted in first-class West-end business. Must be of good appearance and address. Apply, Correspondence Office, S. M., Son & Thompson, Aldergate Street, E.C.

By the first week in April. A Junior Assistant who is 22 or 23, accustomed to a good-class business. The applicant should have a good taste and style, and know something about the trade. Apply, stating full particulars, age, height, and any other matter that may be desired. S. M., Son & Thompson, Aldergate Street, E.C.

AN ASSISTANT, by middle of April. Age 25 to 30. Steady and with obliging manner. Apply, with full particulars, to E. Smith, 21, West St., Horsham, Sussex.

Engagement Wanted.

TO Chemists and Druggists.—A well-educated gentlemanly youth, aged 20, is in search of an engagement with good prospects. Young man is desirous of being employed by a well-established druggist. Respondents will be most welcome. Apply, 21, West St., Horsham, Sussex.
Notes.

**Discovery of New Remedies.**—It is pointed out by E. Merck, of Darmstadt, that although many innovations in medical treatment have been discovered by means of serum-therapy, yet those methods have not so far had any noticeable influence on the discovery of new remedies, the medical and pharmaceutical novelties for 1894 being even more numerous than usual.

**Ownership of Goods on Commission.**—The *Pharmaceutical Era* reports that in a case recently decided in the United States Circuit Court at Chicago, the judge upheld the right to sell goods on which an execution had been levied, even though they were only held on commission. He considered that the system known as "commission invoices" was contrary to public policy, in that it gave the consignee an apparent ownership in property that did not belong to him, and enabled him to obtain credit to which he was not entitled.

'Science Progress.'—The current number of this publication contains articles on "Antitoxin," by Dr. E. Klein; "Foreign Work amongst the Older Rocks," by J. E. Marr; "Insular Floras (Part IV.)," by W. B. Hemsley; "Peptone," by Dr. W. D. Halliburton; "Budding in Tunicata," by W. Garstang; and "The Reserve Materials of Plants (continued)," by Professor J. Reynolds Green.

**Quercracho as a Tanning Material.**—According to the *Scientific American*, the Germans can now make leather as cheaply as any other people, owing to the use of quercracho as a tanning material in place of oak bark. The wood is imported into Germany in logs, and cut into chips for use. A quercracho extract is also manufactured in two forms, described as "crystal" and soft paste. This extract yields a leather of poor colour only when used alone, but if alum and salt be used in addition, it is said to give finer results than gambier.

**Press Telegrams.**—In Tuesday's Times the Chairman of the Press Association shows the absurdity of the Postmaster-General's recent statement that the Post Office loses some £300,000 a year from press telegrams. A large proportion of such messages being sent during the night, occupy the wires at a time when they would otherwise be unproductive of revenue at all. In addition, an enormous amount of profitable business accrues to the Post Office through the medium of newspapers, in the form of letters sent in answer to advertisements, etc.

**Corrosion of Aluminium.**—In the *Chemical News* for March 15, A. Liversidge describes the effects of the weather upon ordinary sheet aluminium. He finds that, though the absolutely pure metal may be permanent in the air, the best aluminium ordinarily obtainable is in that respect very little, if at all, superior to zinc. The prevalent idea that aluminium is a metal resembling gold and silver in their non-oxidising property seems, therefore, to be fallacious.

**Pharmacy Fair at Boston.**—This fair will be held during May in the Mechanics' Building, Boston, U.S.A., and is expected to possess several novel features, the connection of which with pharmacy is but indirect, to say the least. In addition to exhibits by the leading drug houses and kindred trades, there will be a representation of the manner in which hospital work is carried on; a "Soldiers' Home department," model school room and school kitchen, and a day nursery in practical operation (sic). Daily lectures and demonstrations are to be given by ladies. In the words of the *Boston Journal*, "a thousand and one things, many of which even the druggist himself never dreamed, will be on view. It will be an introduction to a broader pharmacy for some pharmacists, and an education in that line for the general public." Music of the highest order is promised among other attractions. More serious business will be represented by the Conventions of the Secretaries of the State Boards and Commissions of Pharmacy of America, and of the Massachusetts State Pharmaceutical Association.

**Properties of Argon.**—In experimenting with some argon supplied by Professor Ramsey, M. Berthelot, the perpetual secretary of the Paris Academy of Sciences, has found that, under the influence of the silent electric discharge, it combines with benzene and other organic compounds. It would appear therefore that argon may be capable of entering into combination under not uncommon atmospheric conditions. Moist filter paper exposed to the silent electric discharge, in the presence of argon, absorbs the latter much as nitrogen is absorbed under the same conditions, but whether a compound is formed which, on heating with soda-lime, will give off ammonia, as in the case of nitrogen, remains to be seen.

**Burning Effects of Extreme Cold.**—M. Raoul Pictet has described the "cold burns" experienced by himself and his assistants during investigations at low temperatures. In some cases the skin is first red, then blue, and subsequently the area of the injured spot extends to nearly double what it was originally. There is a painful itching sensation in the surrounding tissues, as well as at the affected spot, and healing usually takes five or six weeks. In more serious cases the skin rapidly becomes detached, and there is a long and stubborn suppurating, the wound remaining open for more than six months in one instance after a drop of liquid air had fallen on the hand.

**State Aid for London University.**—The whole cost of the University of London to the nation, according to Sir Albert Rollit, is but £20 per annum, and in the House of Commons recently he protested against the niggardly manner in which the Treasury deals with the University. This view of the case was also supported by Sir Julian Goldsmid, but the Chancellor of the Exchequer (Sir William Harcourt) pleaded lack of money as the reason for not contributing to the University funds more freely.
Miscellaneous News.

[Readers are invited to send local information of pharmaceutical interest. When newspapers are sent the paragraphs to be noted should be plainly marked, whilst cuttings should be verified by the addition of source and date.]

The Effects of Soothing Syrup.—At Worcester, on March 12, Mr. W. B. Halme held an inquest touching the death of Alfred Price, fifteen months old, son of Frederick Price, Wellington Street. The child had been suffering from a cold, and on Saturday afternoon the mother gave him a teaspoonful of "soothing syrup. After tea she gave him another dose of half a spoonful, and put him to bed. Early in the morning the mother found the child dead beside her. Dr. Simmons, who had made a post-mortem examination, said he found congestion of the brain, and vague evidence of bronchitis. In the stomach he found a small quantity of fluid, which had a strong acid smell. Mrs. Winalow's syrup contained opium. The congestion of the brain and the paleness of the face pointed to opium poisoning. During five years there had been thirty-two cases of death from soothing syrup. The inquest was adjourned for a fortnight for an analysis to be made to discover whether there was sufficient morphine in the body to cause death; also for an examination to be made of the contents of the bottle. —Birmingham Daily Post.

Glasgow and West of Scotland Pharmaceutical Association.—At the meeting on Thursday, March 7, Dr. T. H. Bryce lectured on "The anatomy of expression." The lecture was illustrated with the lantern, and proved very instructive and entertaining, as Dr. Bryce, after pointing out the action of the muscles in the face giving expression to the mind's impulses, analysed the passions and feelings, man, in common with the lower animals, is heir to. Representations of the dog, cat, monkey, and humanity of both sexes, showing how the strings were pulled, amused as well as edified, and at the close a hearty vote of thanks, proposed by the President, Mr. W. L. Currie, seconded by Mr. John Foster, was heartily accorded.

The Invention of Matches.—At the Borough Hall, Stockton, on Thursday, March 14, Mr. Joseph Parrott lectured on "The light of former days, and how it was obtained." Primitive methods of obtaining light were described, also the quaint processes in vogue in modern times. The old sulphur-tipped splints of most inflammable wood were then shown, and also the method of obtaining light by chlorate of potash and sulphuric acid. A case containing tap of the original matches made by the Stockton inventor, Mr. John Walker, was exhibited, and also Chinese matches. From these exhibits Mr. Parrott passed on to refer to several of the forms of friction matches. The dates are as follows:—The first American patent for them was taken out in 1836. Jonas Irmel, the Hungarian, made the discovery in 1835. He sold it for £700. He was still living in the South of Hungary. Kammerer, the German, discovered it in 1835, and Santas, the Frenchman, in 1831. He still enjoys a pension for his discovery. Sir Isaac Holland's discovery was in 1829, but the late Mr. John Walker, of Stockton, took priority of all, he having invented it in 1827, as his day book proved by the sales entered in it, and thanks to the courtesy of Mr. Hardcastle, Finkle Street, chemist, the lecturer had again lent to him the original book. —Northern Echo.

A Chemist's Assistant Censured.—An inquest was held on March 14, in the Harrington Arms Inn, Long Eaton, relative to the death of Albert Edward Lowe, 19 years of age, of 20, King Street, Long Eaton, who died on the previous Tuesday morning. On the Monday deceased was ill, and his mother got some medicine from Mr. H. Swift, assistant to Mr. G. Sum, chemist. Dr. Systor was sent for early the following morning, but the young man died soon after he arrived. On the Wednesday a post-mortem examination was made, and death was found to be due to meningitis, or disease of the brain, through natural causes probably. Dr. Systor saw some medicines, but found prussic acid in it, but he could not say to what extent. It was stated that prussic acid is an ordinary one for biliousness. Dr. Systor said hydrosylic acid ought not to be given in a haphazard way. After full inquiry, it was admitted by Mr. Swift that he was not qualified to dispense poisons, and the jury, while returning a verdict of "Death from natural causes," censured Mr. Swift for using poisons in the way. It was a custom that must not be continued by him until he was fully qualified to do so. —Nottingham Daily Express.

Brighton Chemists' Ball.—The fifth annual ball, promoted under the auspices of the Brighton Pharmaceutical Association of Messenger and the Royal Pavilion, Brighton, on March 15. Dancing to well-selected music, furnished by Mr. Pullen's band, took place in the Music Room. The North Drawing Room was reserved for supper and light refreshments, and the Corridor was turned into a pleasant lounge and promenade. The arrangement of the supper was carried out by the following stewards: Messrs. C. G. Yarwood (President of the Association), F. Beckwith, A. E. Colman, C. Crowhurst, A. H. Cupit, E. S. Goeling, H. B. Gibson, G. Greensing, T. F. Grindley, A. T. Jesus, C. Kent, A. P. Nowworthy, and H. Gay Price, assisted by the Hon. Secretary, Mr. F. A. Crowhurst, and were found eminently satisfactory. The function, which proved to be one of the pleasantest held in connection with the Association, was extended into the small hours. —Sussex Daily News.

The Physics and Chemistry of Development. —On Monday evening last, at the Cordwainers' Hall, 7, Cannon Street, E.C., the second and concluding lecture of the series was given by Mr. T. F. I.C., F.G.S. The chair was again taken by Sir H. Truesman Wood, and there was a numerous attendance. The lecturer continued his remarks at some length upon the researches of Messenger, Lodge and Herts into the electrical action of light, illustrating the principal points by experiments. Investigations by Professor Meldola have also tended to supports the view that the action of the developer is largely dependent upon the closing of an electric circuit. The bitumen process, introduced by Niepce in 1810, was then described and demonstrated. A copper plate coated with a layer of bitumen having been exposed to light with certain parts covered by paper of non-hydrational colour, was treated with a weak solvent, that used being a very old and oxidised sample of tannic acid, which readily dissolved away the protected portions of the bitumen film, the light-having having had the effect of rendering the remainder much less soluble. In this process a very long exposure is necessary, but that it is capable of producing an image of full gradation was evidenced by a specimen transparency handed round for inspection. In 1839 Daguerre and Niepce entered into partnership, and the former published his process, in which a silver plate was converted upon its surface into a half-salt of silver, and the development effected by exposure to the vapour of Hg, the mercury
is a plate bearing arched appendages; through these pass the systems of nerves and of water-vessels, and to them are also attached muscles by which the creature's jaws are moved.

In the succeeding lecture, March 19, Professor Stewart dealt first with Spirographis spallanzanii, a beautiful annellid found near Naples. This animal produces a bundle of feather-like filaments supported on a cartilaginous spiral, from which arise cartilaginous rods. These act as sensory organs, and by propelling currents of water to and fro, they assist in the food and stir the blood.

In brachyopod the folded mantle which lines the shell sends prolongations into the interior which afford an endo-skeleton. In arthropoda the endo-skeleton is often only a similar inward prolongation of the exo-skeleton, which serves not only to protect the internal structures, but also to afford attachment for the muscles. The king-crab and scorpion furnished further examples on which the lecturer based descriptions of modifications of the endo-skeletons. The lectures were illustrated by specimens of Ophiocoma, Antedon, Phyllacantha, Terebrata, Waldheimia, Limnion, Spirographis, etc.

DIFFICULT SMIOLDT POWDERS.—At Tadmorden Petty Sessions, on March 14, Robert Newall, herbalist, Cheshamps, Tadmorden, was fined £5, with 22s. costs, for selling sedatifs powders that weighed 14½ grains of what was required by law.

UNIVERSITY COLLEGE (LONDON) CHEMICAL AND PHYSICAL SOCIETY.—Professor Ramsey, F.R.S., occupied the chair at the annual public meeting, the 19th inst., when Professor C. V. Boys, F.R.S., gave a lecture entitled "Weighing the Earth." After some introductory remarks, dealing with Newton's law of gravitation and the attraction of spheres, a brief sketch was given of the methods used by various investigators in this subject, and the value of the results obtained by them. Cavendish, nearly a hundred years ago, by using Mitchedell's apparatus, investigated relatively the mass of the earth as compared with the moon, sun, and various planets, and his efforts met with extraordinary success, when we consider the difficulties he laboured under in his research. But the results, as well as those of subsequent workers, only gave the relative masses of the various planets, compared with the earth as unity. But by means of the elaborate apparatus described by Professor Boys, the absolute weight of the earth can be determined. The experiments necessary for the purpose were conducted in underground laboratories at Oxford, placed at Professor Boys' disposal by Professor Gordon, and so great is the accuracy now obtained that errors of 1 in 10,000 can be detected.

The lecture took the form of a detailed lantern demonstration of the various mechanical and chemical details of the apparatus employed, which Professor Boys himself constructed, and of the various precautions taken to obtain absolute compensation and prevent the results being vitiated.

Professor Ramsey, in proposing a vote of thanks, expressed the opinion that no research had ever required more patience or stricter attention to the minutest details.

After the lecture Professor Ramsey announced that he had received an intimation to the effect that Professor Olszewski, of Cracow University, had at last succeeded in determining the critical point and boiling point of hydrogen at 233° and 246° respectively; the ordinary atmospheric pressure. This naturally caused considerable interest, but Professor Ramsey could give no further particulars, and they will be published in due course by Olszewski.
PHARMACEUTICAL FOOTBALL AND CRICKET CLUB.

The annual dinner of this Club was held at the Holborn Restaurant, London, on Wednesday, the chair being taken by Professor Attfield, who was supported by Mr. Michael Cartelghne, President of the Pharmaceutical Society, Professor Greenish, Mr. Richard Breachfield, and other officers of the Society. There was also a fair muster of old students of the School of Pharmacy, and a most enjoyable evening was spent, the musical programme being, as usual, exceedingly attractive.

Press Comments.

COLOURS IN PHOTOGRAPHY.—It has often been observed that a bright scarlet uniform will in a good photographic dark-room with ruby-glass windows, appear perfectly white. On this subject Herr H. W. Vogel made some interesting communications to the Photographic Society of London in his address at a recent meeting, when he experimented with oil lamps provided with pure red, green, and blue colour screens, he found that when white light was rigidly excluded, all sense of colour disappeared to the observers, and nothing but shades of black and white could be distinguished on objects in the room. Further, that a scale of colours illusorily red light showed the red pigments as white or grey, which abruptly turned into yellow, and not red, on adding blue light. Hence a colour was perceived which was not contained in either of the sources. Red and yellow patches appeared of the same colour, so that they could hardly be distinguished. But the difference was at once brought out by adding green instead of blue light. How very much the kind of sensation experienced depends upon the intensity of illumination is easily seen in the case of the region of the spectrum near the G line of Fraunhofer. This region appears violet when its luminosity is feeble, blue when it is stronger, and may even appear bluish-white with strong sunlight, so that the assertion often made that with normal eyes a definite colour-sensation corresponds to a definite wave-length, cannot be upheld. Herr Vogel comes to the conclusion that our opinion as to the colour of a pigment is greatly guided by the perception of the absence of certain constituents. Thus a red substance is only recognised as such when light of other colours is admitted, and we perceive its inability to reflect these.—Nature.

THE FALLACY OF EARLY-RISING.—Proverbs are responsible for a great deal of folly, and none, perhaps, for more mischief under the present conditions of town life, than those which incite early-rising as a virtue. When the great majority lived in villages and were engaged in the cultivation of the soil, early-rising may have been conducive to health and wealth, if not to wisdom, but even our early forefathers probably did no more than make a virtue of necessity. It is said to be natural—that is, physiological—to rise early and enjoy the beauties of the sunrise; if we ask why, we are treated to various transcendental theories about the vitifying influence of the sun, and are told to take example by the birds of the air and the beasts of the field, or so many of them as are not nocturnal in their habits. But, as a matter of fact, physiology, so far as it has anything to say on the subject at all, is all against the early-rising theory. Physiological experiments show that a man does not work best and fastest in the morning hours, but on the contrary, about midday. The desire to rise early, except in those trained from youth to outdoor pursuits, is commonly a sign, not of strength of character and vigour of body, but of advancing age. The very old often sleep much, but they do not sleep long. A long deep sleep, the sleep of youth, requires for its produc-

tion a thoroughly elastic vascular system. The stiffening of vessels of age is not so completely nor so easily controlled by the vasomotor nerves. Hence shorter sleep. Thus paterfamilias, who goes to bed at eleven p.m., wants to get up at five or six a.m., and looks upon his healthy sleep as an odium.

When this foolish interpretation of a proverb about the health and wealth to be got from early-rising is combined with the still more foolish adage, which says of sleep, "six hours for a man, seven for a woman, and eight for a fool," then we have a vicious system, capable of working great mischief to young people of both sexes. They are greatly encouraged in towns by the spread of cycling, to curtall unduly the hours of sleep. Parties of young men and lads are to be met carewering about the street at midnight. They would be far better in bed. They have, probably, to be in their offices or shops by nine a.m., or even earlier, and when time is deucedly in order, supper, toilet, breakfast, and the journey to the place of business, it is evident that the hours for sleep cannot exceed six, or at most seven. These young men are, no doubt, encouraged, by the silly adage quoted above. There is a disposition in town years to discard the outdoor exercise of "morning "spin"s" are instances in point. As Nordan has set with a great deal of truth, the town-dweller of the last decades of the nineteenth century suffers from nervous fatigue, and is so ill-advised as to make very recreations sources, not of recuperation, but of increased exhaustion. If our forefathers were wise, they went also early to bed. It would be well for the rising generation if it paid more heed to the part of the proverb—British Medical Journal.

JAPANESE TEA.—According to a contemporary, the one syndicate of Japanese tea-planters has recently sold a representative to Russia to endeavour to bring tea markets there for the Japanese leaf. It is stated the contracts have already been made with several firms in Odessa for trial shipments, and efforts are now to be made to extend the trade in Japanese tea in the French and English markets. If the Russian, and other, tea creditors with always buying the finest Chinese tea, take to the Japanese article, there is little doubt that other nations will follow.—Financial News.

OZONE AS A THERAPEUTICAL AGENT.—The establishment for medical treatment by ozone has been in operation since 1891 at St. Raphael, France. Its two halls are fitted up for patients of varying degrees of dilution. The inhalation hall has ozonisers of large discharge, with ten months or even each month consisting of a small tube leading in the ozonised oxygen, and around it a larger tube supplying pure air. The patients simply stand or sit in the portion of this room, the entire atmosphere becomes strongly ozonised in a few minutes. The absorption hall, designed for giving somewhat stronger doses of the gas that may be graduated at will, is provided with twenty-four months, from which patients inhale the mixture of ozone and air through mouthpieces. The ozonisers are of two styles, one consisting essentially of a single coke-burner, into which it is entirely converted into ozone, and the other of two concentric glass tubes, the inside staffed with tinned paper, and the outer covered with tin foil. Suitable connections being made with a battery of electric accumulators, the oxygen, pure and dry, is led from a gasometer through these ozoniser tubes, when it is entirely converted into ozone in the convective discharge. The results of the inhalations vary with the age of the patient and the nature of the malady. For anemia and chloro-anemia ozone is a certain specific, while in nascent tuberculosis losing the benefit in overcoming pre-disposition, not in healing lesions already produced.—Locomotiva.
Notes and Queries.

INKS FOR TYPE-WRITERS.

[814.] An ink that is said to be, the *Neue Erfindungen und Erfahrungen* to answer equally well on pads or ribbons is made by mixing castor oil 2 parts; cresote or carbolic acid, 1 part; oil of cassis, 1 part; oil-soluble aniline colour, 1 to 2 parts. There ought to be no difficulty about saturating a pad with it. Another German paper, the *Patent-Druckpistole,* gives the following formula:—Dissolve soap, 30 parts, in glycerin, 125 parts; add alcohol, 720 parts, and water, 360 parts. Finally, dissolve in the mixture sufficient aniline dye to give the desired colour. If the ink should be too penetrating add more soap, and if not sufficiently so add less. The *Scientific American* states that a good ribbon-ink may be prepared by adding as much lampblack to melted soft paraffin as it will take up without becoming granular, and, after cooling, mixing the consistence of fresh oil paint by diluting with a mixture of equal parts of petroleum benzine and rectified spirit of turpentine. Apply to the ribbon by means of a soft brush, and afterwards rub well in with a tooth-brush. A black aniline ink may be prepared by dissolving aniline black, ½ oz., in alcohol, 15 oz., and adding glycerin, 15 oz.

TO COOL SUPPOSITORY.

[815.] The use of ice for cooling suppositories in warm weather is avoided. By J. H. Elson (Meyer Bro. Druggist), who obtains the required reduction in temperature by dissolving ammonium nitrate in water. The mould having been immersed in water almost to the top, the addition and solution of 2 oz. of the salt is said to reduce the temperature to about 30°F., if not more than 14 oz. of water be used. After pouring the melted suppository mass into the mould, add 2 oz. more of ammonium nitrate to the water, and in twenty minutes' time the suppositories can be removed. The ammonium nitrate may be recovered by evaporation and used again for the same purpose.

AMMONIUM THIO-AETATE.

[816.] This compound is employed by Schiff and Tamgi, of the University of Pisa, as a substitute for sulphured hydrogen (Sclent. Amer.). Thiocetic acid is made from acetic acid and phosphorus pentasulphide, and dissolved in dilute ammonium solution to form the salt. About 20 to 30 minutes of a 30 per cent. solution of the latter should be added to the solution to be tested, which is then to be heated to near boiling point. It is said that silver chloroide, bromide, iodide, and other salts are completely converted into sulphiure; mercury salts give a red precipitate of sulpho-chloride in the cold, which is converted into the black sulphide on heating; platinum and gold salts give red precipitates, also changing to the black sulphides on heating; and ferric salts are reduced to the ferrous state.

SYP FOR PAINFUL DENTITION.

[817.] The following preparation has been recommended by the *New York Polyclinie* for use in cases of painful dentition.—Cook the hydrochlorate, gr. iss.; tinct. coni, 3; syrup, 3; It should be rubbed on the gums several times daily.

ADEPS LANE IN OINTMENTS.

[818.] After experimenting for two years, Unna concludes that the softer adeps lane is preferable to animal in ointments (Monats. f. prakt. Derm.). Amongst other formulae he gives the following for cold cream:—Adaps lane, 10 Gm.; gl. amygd., 6 Gm.; sq. flor. aurant., 10 Gm.

Poisoning Cases and Inquests.

**Strychnine.**—Matilda Hannah Johnson, aged 20, died on Monday, March 11, at 134, Embden Street, Hulme, from the effects of strychnine, self-administered. Verdict: "Deceased committed suicide whilst insane."—*Manchester Evening News.*

**Carbolic Acid.**—Lucy Ellen Wood, the wife of an oil-merchant, died on Thursday, March 7, at Lower Tulse Hill, from the effects of carbolic acid, self-administered. Verdict: "Suicide whillet of unsound mind."—*Echo.*

**Chlorodyne.**—Caroline Lamley, aged 44, died at Byers Green on Friday, March 1, from the effects of an overdose of chlorodyne. Verdict: "Deceased died from an overdose of chlorodyne, but there was no evidence to show whether the dose had been taken inadvertently or intentionally."—*South Durham Mercury.*

**Laudanum.**—Elizabeth Leyland, an elderly widow lady, was found dead in bed on Wednesday, March 13, in New Street, Crewe. She had been taking laudanum to induce sleep and had apparently taken an overdose.—*Manchester Courier.*

**Corrosive Sublimate.**—Middleton Brown, aged 64, died on Sunday, March 10, at Cleeby Moor, from the effects of corrosive sublimate, self-administered. Verdict: "Deceased died from the effects of poison, self-administered."—*Birmingham Daily Post.*

**Carbolic Acid.**—Thomas Connor, aged 45, died on Wednesday, March 13, at 22, Newham Street, Liverpool, from the effects of carbolic acid, self-administered. Verdict: "Suicide whilst temporarily insane."—*Liverpool Post.*

**Carbolic Acid.**—Elizabeth Flaker, aged 42, died at 56, Kenton Street, Bloomsbury, on Wednesday, March 13, from the effects of carbolic acid, self-administered. Verdict: "Suicide while in a state of despair."—*Standard.*

**Laudanum.**—Thomas Wilson Dudley, aged 34, an insurance agent, of Kennington Park Road, died in a house in Yorke Road, Lambeth, on Monday, March 11, from the effects of laudanum, self-administered. The coroner commented on the fact that it was quite possible to buy a pint of laudanum if a chemist chose to supply it, and pointed out that the only restriction was that the bottle should be labelled "Poison." Verdict: "Suicide while temporarily insane."—*Morning Advertiser.*

**Laudanum.**—Richard Philp, aged 43, dispenser at the Provident Dispensary, Leamington, died at Leamington, on Friday, March 15, from the effects of an overdose of laudanum. Verdict: "Death from misadventure."—*Birmingham Daily Post.*

Publications Received.

**REPORT OF THE PORT OF LONDON SANITARY COMMITTEE, WITH THE HALF-YEARLY REPORT OF THE MEDICAL OFFICERS OF HEALTH FOR THE PORT OF LONDON TO DECEMBER 31, 1894.** Pp. 60. From the Committee.
Trade Marks Applied For.*

185,889.—LYNN'S FIG REMEDY, and clusters of fruits and wording on a label. A medicine for human use.—Charles Lynn and Co., 18, St. Bride's Street, London, E.C. November 26, 1894. The essential particulars are the device of the clusters of fruits and the fac-simile of the applicant's signature.

185,931.—DEVEUX'S WOUND LOTION and fac-simile of applicant's signature. A medicated lotion for the cure of wounds, for human use.—Aberer and Co., 7, Lovaine Terrace, Newcastle-on-Tyne. January 18, 1895. The essential particular is the signature.

185,902.—FORBLOOMER and other wording on a label. A patent medicine for human use.—Ashley Cooper, Orchard and C.I., Woodland Works, Meanwood Road, Leeds. January 29, 1895. The essential particular is the word 'Forbloomer'.

186,314.—AROSCOPIC.—Spectacles and eyeglasses.—Leon Kokeinsh, 1, Great Ormond Street, London, W.C. January 29, 1895.

186,365.—DEVICE—A JUG IN A BASKIN.—Perfumery (including toilet articles, preparations for the teeth and hair, and perfumed soap).—Emil Danniger, 167, Piccadilly, London, W. January 8, 1895.

186,380.—DEVICE.—Perfumery (including toilet articles, preparations for the teeth and hair, and perfumed soap).—Wm. Topley and Sons, Limited, 8 and 10, New Road, Woolwich, London. January 10, 1895.

186,405.—CUTEXIN and fac-simile signature of the applicant. Perfumery.—Fryer and Co., 1, Evers Terrace, Lowestoft. January 22, 1895. The essential particular is the fac-simile signature.

No. 184,887.—CARL'S.—A medicated lotion for chapped hands.—Arthur Horton, 186, Gloucester Road, Bishopston, Bristol. January 15, 1895.

No. 184,798.—DEVICE—A FOWL.—Liners for oil use in manufactories.—Frederick Friend, 11, King William Street, London. November 21, 1894.

No. 184,862.—KOPONAX.—Perfumery, and a preparation for the hair.—Francis Samuel Collyer, 10, Smithfield Street, Coventry, Warwickshire. January 14, 1895.

No. 186,171.—PARADISE-BIRD BRAND.—Device. A bird of paradise in a branch, including toilet articles, preparations for the teeth and hair, but not including perfumed soap, and not including any goods of a like kind to perfumed soap.—Thomas Pink, Staple Street, Long Lane, Borough, London. January 20, 1895.

No. 184,728.—WORTHALL and device of a nurse, and parts of a table and a bed.—A sterilising, disinfecting, and deodorising fluid.—Charles Thomas Gardner, 10, Susex Road, Worthing, Sussex. January 9, 1895. The essential particular is the device.

No. 185,106.—KONVO.—Chemical substances prepared for use in medicine and pharmacy.—William Mottram, 96, Fleet Street, London. January 24, 1895.

No. 184,265.—PAXO.—Sanitary pads or towels (not medicated) for women, and belts specially prepared for supporting the said pads or towels.—Robt. Darton Gibbs, 77, St. John's Wood, Birmingham. December 14, 1894.

No. 184,073.—KOZZE.—A Bird of paradise and other preparations for the teeth.—Gavin Martin, 71, Manningham Lane, Bradford, Yorkshire. December 4, 1894.

184,150.—DEVICE.—CARD, KING OF SPADES.—Perfumery and toilet articles (preparations for the teeth and hair, and perfumed soap).—Hodgson and Simpson, Calder Soap Works, Wakefield, Yorkshire. January 28, 1895.

Patent Office Business.

Applications for Patents.*

Where complete Specification accompanies Application, an asterisk is suffixed.

No. 4535,—An apparatus for stereoscopic photography with one lens. March 4, 1895.

No. 4590,—A new or improved compound for the cure of toothache. * March 4, 1895.

No. 4588,—Improvements in photographic developers. * March 4, 1895.

No. 4590,—Improvements in openers and shakers for internally stoppered bottles. March 5, 1895.

No. 4583,—An improved photographic camera. March 5, 1895.

No. 4584,—Improvements in wooden vessels for the transportation of acids and other corrosive liquids. March 5, 1895.

No. 4583.—Improvements in plates used for photographic purposes. March 7, 1895.

No. 4581.—A new or improved washing rack for photographic films. March 7, 1895.

No. 4584.—A new or improved bottle stopper. * March 9, 1895.

No. 4595.—Improvement in bottles for gums and such like or other fluids. March 9, 1895.

No. 4595.—Apparatus for raising liquids by air pressure. March 9, 1895.

No. 4589.—A needle stuff indicator for photographic cameras and similar purposes. March 9, 1895.

Patents published during March.

White lead (Matthews, R.).—Comprises an improvement in Patent No. 29,951, of 1892, granted to Matthews, R., and refers to the manufacture of white lead of treating litharge or other lead oxide with a mixture of acetic acid and glycerin. The proportions used and the exact method of treatment are described in the specification, which is divided into a base lead acetate. This allowed to settle in a tank, and, after the supernatant liquor has been drawn off, is treated with a strong carbonic acid gas. A basic carbonate suitable for use as a pigment is thus produced. It is passed through a press, washed with a weak solution of ammonium or alk carbonate, and dried. No. 7129 of 1894.

Compresses, Bandages, etc. (Snedekor, C. F.).—In cases where a hot compress, etc., is required, a series of electric conductors wrapped in asbestos, etc., are enclosed at intervals between two layers of fabric, which is further enclosed in a bag of Turkish towelling, etc. The heat generated by passage of electricity through the conductors the temperature being regulated by means of a thermostat by throwing certain of the conductors into or out of circuit. No. 7385 of 1894.

Phosphorus (Shearer, A. and Clapp, R. R.).—Phosphorus is prepared by heating native or other alkali phosphates with carbon and a chloride, such as potassium, sodium, or calcium, or a mixture of them, current of dried hydrochloric acid gas. Ordinary uncharcoal, coal, coke may be used. The temperature preferred is a red heat. No. 7038 of 1894.

Soap (Gross, A.).—A cleansing agent for laundry work is prepared by mixing petroleum ether with solution of the best soda soap, then adding vinegar, linseed oil, benzine, or other light spirit, and finally mixing in its powered steerine. No. 13,683 of 1894.

Disinfecting and Purifying Air (Sharp, M. B.).—The invention comprises an arrangement acting on the fountain principle, by which the disinfectant or poison

* Compiled from the Illustrated Official Journal (Patents).
EPITOME OF CURRENT EVENTS.

[PHARMACEUTICAL JOURNAL.]

Atonmatically runs from a globular reservoir upon a porous surface as fast as it evaporates therefrom. No. 16,414 of 894.

Pills (Tiddesley, T.).—Pills for liver and other common complaints are to be made from a mixture of white asp, feld lemon, blood root (red poconoo), tarmeric, black oot (culfire), mafragge, convolvulus, "oleoerin papier," 11 of Colts, extract of dogweed or scentillaria, extract of willow bark or cypress, and extract of barberry. No. 21,589 of 1894.

Insecticide, etc., distributing (Davies, J. F.).—The insecticide, disinfectant, etc., is contained in a metal case tied with a spout at the bottom of the front side, and another side, and the case is carried into the field on an injecter consisting of a collapsible indiarubber ball. In compressing the ball, air that enters the other side, is expelled at the spout. No. 639 of 1894.

Antiseptic tissues (Neyron, L., and Cohen, A.).—A sealed fabric having antiseptic and absorbent properties, prepared by weaving wool, cotton, silk or other material, which has been incorporated 5 to 25 per cent of setil be previously prepared by heating at 100° C. For four hours. No. 3668 of 1894.

Obstetrical forceps, etc. (Longmate, W. C.).—The scopas or other instruments are formed with detachable handles which are secured by a screw, spring-catch or other means of fastening. They are removed from the case, and is said to be superior to those with braided handles, which crack and afford foreign matter at the joints. No. 140 of 1894.

Preparation of Alkaline Salts (Kellner, C.).—The aquaphorum ordinarily employed in the cells for electrolytic salts, is replaced by one which allows passage of the electrolyte but minimizes diffusion of the hydroxide. Reacted by the electrolysis, it forms alkaline compounds. The inventor prefers to use a diaphragm, formed a soap containing its base the alkali which is being electrolyzed. It may be shaped as a plate, which may be rammed with a rigid skeleton, or it may form a sheet fixed or perforated plates of inert material. 7,891 of 1894.

Anthracene (Newton, H. E., communicated by the urbenfabrik, formerly Friedrich Bayer, and Co.).—The dicrosnes, naphtho, aromatic bases, or liquid sulphur azide at present employed for washing crude anthracene, replaced by acetic acid and other fatty ketones. The inator prefers to employ "raw acetic" or "acetic" acid, which is mixed up with two-thirds its weight of the thiosulfate, heated to 60° C. for an hour, and cooled. The purities dissolved in the acetic acid are then removed by filtration, and the residual anthracene is washed with more acetic. No. 72 of 1894.

Ferro-manganese Alloys (Brook, J., and Allen, J. F.).—Ferromanganese and copper in a finely divided condition are mixed and fused with suitable fluxes, such as lime carbonate, borax, and common salt, the resultant mixture being to be practically free from iron. A suitable mixture consists of 3 parts of copper, 1 part of ferromanganese, and a flux consisting of 10 per cent. of lime carbonate and 5 per cent. of borax and common salt. No. 658 of 1894.

Nourishing Liquids, etc. (Laurent, P. M. F.).—The inator relates an apparatus for sterilising wine, beer, k, etc., for condensing vapours, etc., and for heating or cooling purposes, a vessel mounted in a cylinder, or the lid to vapour or passage through one or two passages speeded by spiral oiling thin metallic surfaces in such a way as to produce two passages separated by a single plate or plate the metal. The heating or cooling medium passes through the second of the passages in the opposite direction to that traversed by the liquid, etc., treated, and is to have, when leaving, the same temperature as the substance treated possesses when entering the apparatus.

Itinating Metals, etc. (Abele, C. D., communicated by the Electizittis-Gesellschaft Gelhausen mitfratkner Haftung).—Methan or other usable forating jet or jets of steam, compressed air, etc. The aerial issues in the form of a jet from a nozzle, at a perpendicular to the fusing point, special arrangement being used to maintain the heat up to the time of use. The steam, air, etc., employed is heated by passage through a channel between the heating appliance and the vessel containing the metal, etc., and is preferably used in the form of several jets crossing each other obliquely. No. 44,274 of 1894.

Electro-deposition of Silver, etc. (Moebius, B.).—Relates mainly to the treatment of bullion containing silver, gold and copper. The anodes formed of the bullion are arranged above and close to a cathode consisting of an endless metallic band which passes over two rollers and continuously moves in the direction toward an endless travelling belt. The electrolytic bath is so arranged that the silver deposits in a loose spongy condition on the cathode, and when it reaches the travelling belt, falls upon the copper set, which is covered with a canvas or other frame, which retains the gold as it falls from them. The copper remains in solution in the bath. No. 469 of 1894.

Hereda trusses (Waddell, M., and Kinney, J.).—The arms of a double truss are hinged to a backplate and are bent downwards at the end carrying the pad to which they are screwed or otherwise attached as usual. The pad and the backplate are preferably made of perforated aluminium. The arms are constructed of spring steel. No. 1312 of 1895.

Phenestin-citric acids (Johnson, J. Y., communicated by Heyder-Nachbolger, F. von.).—The mono and di-citric acids are distinguished by "substances" of rapid solution and without secondary reactions. The di-acid is a white powder, difficultly soluble in water, but more soluble in caustic soda and alcohol. It melts at 127° C. The mono-acid white while the containing water of crystallisation and melting at 72° C. When crystallised from chloroform, it is anhydrous and fusible at 127° C. It is readily soluble in water, has an acid reaction, and is soluble with effervescence in a "soda solution." The sodium salt of each acid is soluble in water, but insoluble in alkaline solutions. The acids are prepared by heating para-amido-phentol with citric acid in proportions dependent on which acid is required. The temperature used is 200° C. and the resultant mixture is treated with a solution of soda. The liquid is filtered and treated with hydrochloric acid, and the precipitated acid is recrystallised from chloroform or water in the case of the mono-acid, or from alcohol in the case of the di-acid. No. 1384 of 1895.

Trade Correspondence.

[Under this heading it is proposed to publish letters to the Editor, which deal more especially with the trade aspects of pharmacy. Correspondents should write on the side of the paper a copy of their names and address, preferably with name and address for publication.]

PREPARATION OF EXTRACT OF BEEF AT CHICAGO.

SIR,—Referring to the article which appeared in the London Times of the 4th inst., a portion of which has been reprinted in your Epitome for March 9, on the subject of Chicago packing houses, we think that whatever may have been the source of the article, the writer defeated his own object, even viewed from a public standpoint, by his own indelicateness.

The publishers of the Times have been utterly misled by their correspondent, and although unwilling to publicly acknowledge it, they have already ascertained that no beef meat inspection is so strict as that enforced in Chicago, and it would be impossible for any packer to cut up diseased cattle for human food, as stated by the Times correspondent.

Personally, we protest strongly against such a general statement, for the reputation that we have been able to sustain for preserved meats and ox-tongues under the Armour Canning Co. brand for nearly a quarter of a century, is evidence that we supply only products of the highest grade, all of which are carefully examined before being put up, and we certainly should not stoop, nor would any respectable firm, to the practices described.

Our extract of beef department is scrupulously clean and open to the public, and all demands of visitors from Great Britain have at various times visited our packing house, which is really one of the sights of Chicago, and all can corroborate our position in this matter.

69, Tooley Street, E.E.

ARMOUR AND CO.

March 16, 1896.
Obituary.

Notice has been received of the death of the following:

On March 11, Frederick Robert Hughes, chemical manufacturer, died at his residence, The Links, B'ness, after a short attack of influenza. Mr. Hughes, who was 67 years of age, had a wide reputation among pharmaceutical and analytical chemists as a manufacturer of iodine and other chemicals. He was the first to succeed in extracting cyanogen from atmospheric air, a discovery which attracted little attention at the time (1852). For many years he made continuous experiments in the extraction of iodine from kelp or burnt seaweed, and eventually succeeded in perfecting a process quite original in the manufacture of this chemical. His works at B'ness cover over two acres, and at one time he employed over 120 men. Mr. Hughes was a Fellow of the Astronomical Society, and was engaged for a number of years in the manufacture of spectacles. His Observatory at B'ness contains some of the finest instruments in the kingdom. He was a Fellow of the Chemical Society, and a Fellow of the Horological Society. He took out a great many patents, and contributed many articles to scientific journals. He was also one of the B'ness Town Trustees for a number of years, and took an active part in local affairs. At the time of his death Mr. Hughes was the oldest man in the burgh.

On March 8, Issac Jones, Chemist and Druggist, Walworth. (Aged 71.)

On March 12, Robert Smyth, Chemist and Druggist, Pontypredd. (Aged 65.)

On March 12, Richard Griffith, Pharmaceutical Chemist, Slough. (Aged 73.) Mr. Griffith was local secretary for Slough, and had been a member of the Pharmaceutical Society since 1846.

On March 12, E. Charles Wynter, Chemist and Druggist, Eastbourne. (Aged 55.)

On March 13, William Watts, Chemist and Druggist, Portsmouth. (Aged 71.)

On March 18, Alexander Seath, Pharmaceutical Chemist, Dunfermline. (Aged 68.) He began his apprenticeship with the late Mr. Dron, of Kirkaldy in 1840, and about forty years ago came to Dunfermline, where he has been in business ever since, as successor to the late Mr. Moir. He became a member of the society in 1854, and has been a contributor to the Benevolent Fund for upwards of thirty years. From 1875 to 1882 he was a member of the Executive of the North British Branch, and for fifteen years he has been Local Secretary in Dunfermline. He took a warm interest in all pharmaceutical matters. He was for twenty years a member of the Dunfermline Town Council, and acted for a time as Burgh Treasurer, and afterwards as a magistrate. In politics he was a Conservative. He was an office bearer in the United Presbyterian Church, and a liberal contributor to charitable institutions. He was a man of wide and varied learning, and possessed a rare faculty of personal appearance, and was always on terms of the highest respect among all classes. One of the old type of pharmacists, methodical, precise, absolutely trustworthy, and always at his post, and yet one who magnified his calling and looked upon it as something more than a trade, he won the confidence of the community. For several years he had been in delicate health, and died of anemia on Monday last.

Technical Notes.

Professor Schiff and Dr. Tarugi describe in *Berichte* a substitute for the disagreeable sulphurous hydrogen employed in qualitative analysis. The new reagent is the ammonium salt of thio-acetic acid which is decomposed by hot dilute hydrochloric acid liberating sulphuretted hydrogen without precipitation of sulphur. When a feebly ammunated solution of ammonium thio-acetate is added to a hydrochloric acid solution of the metals of the new group, the metal is precipitated as sulphides. Only a very faint smell of H₂S is said to be perceptible. — *Technical World.*

An electric plough has been brought out by Messrs. F. Zimmerman and Co., of Flack, in which a chain is stretched round the field where required to run over a sprocket wheel on the motor. The plough is the able to wind itself up and drag the plow after it. The cable to the motor is carried by a number of small trolleys running over the grass. The length of cable is sufficient to reach across the field, as the motor, as it winds itself backwards, swings the cable over the ground by starting work on the side nearer the motor and working up the field away from it; the cable does not foul the plough. The trials of the plant are said to have been most satisfactory. — *Technical World.*

In testing for starch in solution, an aqueous solution of iodine may be added in considerable quantity without the characteristic blue colour being developed, but the addition of even a minute quantity of potassium immediately brings about the desired action. This has been explained by Mylius, who states that starch contains as a necessary constituent, pizarum or hydrogen iodide, but C. Meincke has recently published the result of a large number of experiments on this point, which show that the foraminiferan starch is also facilitated by the presence of many other salts, notably the chlorides of borax, sodium, ammonium, and calcium; the sulphates, potassium, ammonium, and sodium, magnesium, sulphate, alum, and borax, although the action of these salts in producing the reaction varies considerably. — *Public Health.*

An inexpensive photographic tray or battery which is practically water, acid, alkali, proof, made out of a pasteboard box by covering it with a coating made by melting together equal parts of paraffin and gutta-percha chips. The gutta-percha sheet is melted first over a low fire, the paraffin is then added and the whole composition thoroughly mixed, brought to a very fluid condition. It is then poured into the box or box cover, which should be dry and warm. The composition should be allowed to rest at the edges, so that the entire inside of the box is proofed, the excess is poured off and the box is allowed to cool. The outside should then be proofed in the same manner. In case any spot should receive the composition, some of it may be made into sticks and applied to the bare places with the aid of a hot iron, which may also be used to smooth over any unevenness of the surface. Photographers who have ridges in the tray to keep the plate off the bottom to facilitate in lifting it out. These ridges are easily built up with the aid of a hot iron. Pasteboard trays are light and are not liable to break by a fall. Old dry plate boxes may be used for this purpose. Wooden trays may be washed in the same manner and can be used for letterpress.
Notes.

ANALYSIS OF OILS, FATS, AND WAXES.—The work, published in German by Professor R. Benedikt, on the chemical analysis of oils, fats, waxes, and commercial products derived therefrom (Die Analyse de Fette und Wachsen), and regarded as the best work on the subject, has been rendered into English by Dr. J. Lewkowitsch, who has in addition revised and enlarged the book. This English version, which occupies some 700 pages, and has just been published by Messrs. Macmillan and Co., of London and New York, is the only work in the language dealing especially with the chemical analysis of oils, fats, and waxes.

ABBREVIATED NAMES FOR CRYSTALS.—In a paper read before the Australian Association for the Advancement of Science, Professor Livesidge proposes to avoid the waste of time involved in the use of “the present sesqui-pedal names” of crystals by employing abbreviations ordinarily. Thus, octahedron would be abbreviated to octreron, hexahedron to hexron, pentagonal dodecahedron to pentron, dodecagonal pyramid to dicromid, etc., effecting a total saving of 174 letters in the list of 24 names given as an example, or an average of about seven letters each.

ARGON, AN ELEMENT WITHOUT VALENCE.—In last week’s Chemical News, Lieut.-Col. Sedgwick claims to have anticipated the existence of an element, without valency and of the atomic weight of argon, in his work on ‘Force as an Entity’, published in 1890. In that work he assumed that the atoms are spherical bodies with flat places on their surface corresponding in number to their valency. Clerk-Maxwell’s conception of lines of force was that of currents in an incompressible fluid, and, according to Sedgwick, by means of the flat places two atoms could be firmly united by a film of this fluid, which is assumed to possess an overpowering tendency to attach itself to matter. The form postulated, therefore, for the non-valent atom is that of a perfect sphere; since bodies which are perfectly spherical in form cannot be united by a film but roll upon each other. In an “ideal” table of elements, given in the book, an inactive element is tabulated which is said to agree exactly with argon, taking its atomic weight as 40, and it is pointed out that though this is only stated incidentally, yet the whole argument in connection with which it is given hangs upon the existence of elements without valency, with atoms in the form of perfect spheres, and postulates the existence of such elements.

MANUFACTURE OF QUININE.—It is announced that a limited company has been formed to build a quinine manufactory in Batavia, with a capital of 1,000,000 florins, and negotiations have been entered into with a number of the more important planters for taking over their crops for a series of years.

LIQUEFACTION OF HYDROGEN.—As briefly intimated in our report of the University College Chemical and Physical Society last week (Eph., p. 105), Professor Olzewski announces that he has liquefied hydrogen, its critical point, measured with a platinum resistance thermometer, being 233° C., and its boiling point at atmospheric pressure—243°. An account of the results, which are described as satisfactory, is to be published in English. In connection with the controversy between Professors Olzewski and Dewar in the Philosophical Magazine for March, Professor Dewar replies in some detail to allegations made by Professor Olzewski in the February number of that publication, and concludes by asserting that, with the exception of the determination of the refractive indices of liquid oxygen, their work has had nothing in common.

ANTI-DIPHTHERIC SERUM.—The Journal de Pharmacie announces that the Institut Pasteur now supplies anti-diphtheric serum to pharmacists, who alone have the right to supply it. It is delivered in bottles of two sizes, at 5 francs and 24 francs respectively, and these are to be retailed to the public at 6 francs and 3 francs each. Hospitals and indigent persons are supplied without charge. In the instructions supplied with the serum, it is directed that the bottles should be kept at a low temperature in a dark place, without removal from the cases in which they are sent out. The serum becomes inactive above 50°, and to ensure its preservation a very small quantity of camphor has been added. Used in doses of 5 c.c. it is said to secure immunity against diphtheria for four to six weeks, and its preventive power is such that the injection of a quantity equal to 1/50,000 of the body weight of a guinea-pig will enable it to withstand the effects of a fatal dose of a virulent culture of the toxin of diphtheria.

DEGREE FOR PROFESSOR THORPE.—The University of Glasgow has resolved to confer the degree of Doctor of Laws on Professor T. E. Thorpe, D.Sc., Ph.D., F.R.S., Principal of the Inland Revenue Laboratory, Somerset House.

HELIUM AND ARGON.—M. Berthelot announced at the meeting of the Paris Academy of Sciences on Monday, that he had received a telegram from Professor Ramsay announcing that he had obtained argon from the mineral cleveite, mixed with helium, the existence of which has been only hypothetically admitted heretofore, on the strength of a line in the solar spectrum. Helium is said to be indicated in the spectrum of argon, and the discovery has been confirmed by Mr. Wm. Crookes. The line associated with helium has also been noted by some observers in the spectrum of the aurora borealis, and it is alleged that M. Berthelot conjectures that to argon may be traced the blighting harshness of the east wind. Reference to the discovery of helium was made at the meeting of the Royal Society last week, and also at the annual meeting of the Chemical Society on Wednesday by Professor Ramsay and Mr Wm. Crookes.
Novel Price List.—For some years E. Merck, of Darmstadt, has been asked by physicians, who wished to have an idea as to the relative cost of remedies, to indicate in his annual report the prices of the preparations mentioned in it. This he has demurred to do lest it should in any way affect his relations with pharmacists. He has now, however, adopted an ingenious plan which consists in classifying the preparations in six groups, typical representatives of which are scopoline hydrobromate, cocaine hydrochlorate, atropine sulphate, antipyrine, quinine sulphate, and potassium iodide. All the preparations in a given group approximate somewhat in price to the type, and there are only a limited number of exceptions which occupy intermediate positions. Of course, it is obvious that such a system would not be viewed with much favour in this country, though it may prove satisfactory in Germany where medical practitioners confine themselves to prescribing.

The Faraday Medal.—The Chemical Society has conferred its Faraday medal upon Lord Rayleigh in recognition of the discovery of argon. The previous recipients of the Faraday medal have been Dumas, Canizzaro, Wurtz, Helmholtz, and Mendeleeff. The Electrician points out that Lord Rayleigh’s work is the more remarkable because it was carried on upon purely physical lines, and owed its success to the extreme refinement and exactitude with which he repeated the investigations of Regnault on the density of atmospheric gases. It is curious to reflect also that nothing but lack of the needful delicacy of measurement has delayed for 110 years the discovery, upon the threshold of which Cavendish stood in 1785. At the annual dinner of the Chemical Society on Wednesday last, it was stated that the discovery of argon was the outcome of twelve years’ patient work by Lord Rayleigh.

Proposed Technical College at Watford.—For some time past a series of Glchiest lectures has been conducted at Watford, and at the conclusion of the course on Tuesday, March 19, Professor Attfield, as Chairman of the Town Committee, explained the progress that had been made to meet the wishes of the Glchiest Trustees with reference to the foundation of a permanent technical college at Watford. After summarising what had been done already, and explaining that both funds and organisation were requisite to carry out the scheme, Professor Attfield said that in the first place, however, it was necessary for people to decide what they intended to do with technical education when they got it. It was useless to raise the powers of students if they were to be depressed again to a dull dead level by the interference of trade unions, and absurd for the latter to attempt to restrict a workman to one kind of work, and to restrict the best workmen to the amount of work done by the worst.

Irish Sulphur Mines.—According to a financial paper, it is stated that a movement is on foot for re-opening the sulphur mines of Ballymurtagh, county Wicklow, which were at one time in a flourishing state.

Miscellaneous News.

[Readers are invited to send local information of pharmaceutical interest. When new preparations and their properties are to be noted they should be plainly marked, while cuttings should be verified by the addition of source and date.]

Professor Black on Medical Etiquette.—On March 21, Professor Campbell Black delivered the closing lecture for the session at Anderson’s Medical College, Glasgow. He advised the students that medical practitioners they would find much to disappoint them. If they summoned courage’s eminence because they were strong, they do not think that their deserts would be commensurate with the amount of gold they could rake into their coffers. If success were to be estimated by the banker’s balance they had better throw physic in better sense to the dogs. Medicine was no more exact science than millinery. If ever it did rise to the dignity of an exact science it must be based on the “eternal verities” of Anatomy, Chemistry, and Physiology. Keeping that in view, they could tell in the true spirit of science is the stone in its proper place, and be content to wait results. They could in doing so earn, as they had a period. That is heathen, a fair degree of difficulty, for they are to be bent, toiling at the same time a satisfaction higher than money could afford. In the first years of their professional existence they would doubtless come into a world with what is called “medical etiquette.” He thought he had received more than his fair share of kicking and injustice, and he was yet unable to define what professional etiquette might be—if it is not a tacit understanding among men born to what is called good positions and the inheritance of wealth to crush and repress, with the bitterest vindictiveness, often diabolical machinations, the legitimate aspirations of young men who may have the misfortune to be born poor and too proud to crawl. He was frequently said before, and he defiantly said again—there should be no code of morals or etiquette in the medical or any other profession, but the code of morals and of etiquette which regulates the conduct of all gentlemen in their relations with one another. It was the duty of the student to be humble, to be modest, to be patient, to be industrious, and to remember the warning of the BremenLieth that a book was actually in circulation was a view to making medical practitioners gentleman. He did not think so many of any of them to believe that they would ever be found going about with a “moral ready reckoner” in the pockets.

Greenock Personation Case.—As briefly announced in the Supplement to last week’s Journal, Sheriff-Principal Cayne, on Thursday, March 3, issued his interlocutor in the case of Conner v. Cairns in which the pursuer sued defendant for £900 damages for alleged slander, in that he had made statements to the effect that Conner had conspired with Francis Lambie to pass the First examination of the Pharmaceutical Society in his stead. The Sheriff-Substitute gave decree of absolvitor, against which decree pursuer appealed. This appeal has been dismissed with expenses against the appellant, and it is said the Sheriff says he had the benefit of a very able and exhaustive review of the evidence from Mr. Murray, on behalf of the pursuer, and had since then heard and re-read the evidence most carefully. With a strong desire to decide in favour of the pursuer, his Lordship in an adverse judgment should be attended with serious consequences, he regarded.
to say that, after full and anxious consideration, he had found himself unable to differ from the conclusions arrived at by the Sheriff-Substitute, whose interlocutor he accordingly affirmed. A crucial circumstance in the case was the positive identification of Lambie as the person present at the examination of January, 1892, by no fewer than five witnesses, some of whom had any interest whatever in the result of the case, or any conceivable motive to say anything except what he believed to be the exact truth. No doubt three years had elapsed since the witnesses saw the man whom they professed to identify, and if there had only been one or two of them, the theory of suggestion might have been put forward. But here the Sheriff-Substitute had observed that the cumulative force of their evidence was very strong, and he could not bring himself to believe that the whole five were mistaken, more especially when he found that the proof contained what he could not but accept as pregnant, corroborative of their testimony. He had formed, on a study of the proof, a decided impression that Lambie and not the pursuer sat for the examination in question.

SCALDING DEATH IN BOILING WAX.—The deputy coroner for Manchester held an inquest on March 10, on the body of Thomas Waitegofer, aged 44, a boiler at the Sculpturing Chemicals Co., who was killed. He previous Saturday afternoon he was striding over a tank containing paraffin wax in order to turn off steam, and fell in. His screams brought the workmen, who found him lying in the boiling wax, which was a foot deep. He died in great agony at the infirmary. A verdict of "Accidental Death" was returned.

SHOULD DOCTORS DISPENSE?—A correspondent of "It Bits" remarks that pharmacy is a trade or profession which is really little understood by outsiders. A chemist's real business is dispensing the prescriptions of medical men, and a doctor's real business is acting as a medicinal authority. A patient is really better off to pay his doctor for his advice and prescription and take it to a reliable chemist, who, he chances are 1000 to 1, will charge according to the quality of the drug supplied. There is absolutely nothing that varies so much in price as drugs. The following Glories of Pharmacy is said to show the absurdities of a chemist's business. The table shows what he might safely charge for a certain number of drugs. The majority of drugs can be bought at any price, and it stands to reason that a chemist supplying a good, sterile quality cannot charge the same, say, the stores, where the proprietor is not a chemist at all, and really does not, in many cases, understand the true manipulation of drugs any more than his errand-boy or porter, and often has no clues as to quality.

MASON COLLEGE CHEMICAL SOCIETY.—This Society held its last meeting for the present session on Thursday, March 21, when Mr. S. W. Scott read a paper on "The Transformation of Starch by Diastase." He first gave a short sketch of the chief investigations on the subject since the beginning of the century, and then proceeded to describe in detail O'Sullivan's work on the constitution and reactions of the various dextrins. He dealt with the subject of maltodextrins of Horsfield, and that of Brown and Doolittle with the amylopectins. The theory propounded by the two later investigators respecting the degradation of the starch molecule was opposed by the theories of Lintner and Döll on the one hand, and of Scheibler and Mittelmeier on the other, who are also laid under contribution. Experiments were described in which the starch and diastase, the various dextrins, maltose, and xylitol were the subjects of investigation. A discussion followed, after which the spectrum of argon was exhibited and compared with that of nitrogen.

PHARMACEUTICAL FOOTBALL MATCH.—Westminster College of Pharmacy v. South London School of Pharmacy. These matches were played at Tooting Common, on Saturday the 23rd inst., and a well-contested game ended in a victory for the former in 1 goal to nil. This result reflects great credit on the Westminster men, as their team was rather disorganised by the absence of their captain, and having to play two substitutes.

Brixton and Clapham Camera Club.—The fifth annual exhibition of this club is being held this week at Brixton Hall, Acre Lane, London, S.W., and on Thursday last a lantern lecture was given by Mr. W. Lammow Howle, of the firm of Barron, Harvey, and Co. The subject was "The Scottish Alps," and the lecture was illustrated by over 100 magnificent views, photographed by the lecturer. These included the following:—The Bens of the Highlands; Border Valley; Killin and Loch Lomond; the Dariel, summer ascent of Ben Lawers, summit views and cloudscapes.—Spring ascent of Ben More:--A steep coloir; an overhanging snow cornice; the final ridge; frost feathers. Summit views from Ben Lui; the Glencoe mountains, from Stob Ghhabbar; figure genev subjets; the photographic mountain summit; the fisherman; Highland lassies; the old smuggler. Etc. In Cloudland: The nimbis; local rain; a Highland shelter; scattering clouds: the cumulus; mist of the morning, etc., etc. In Glimpse of Skye: Waterfalls; Loch Coruisk; Blaven, Scuir-na-Gillell; rocky ridges and pinnacles; the Quinag, etc. Mountain Sculpture: Demolition—conglomerate pillars near Fochabers; Slaty Slioth; the Frost Hammer; granite cyclopean walls, Goatfell; erosion; point holes on Cloch Bhan; glaciation; striated rocks at Loch Avon, etc., etc. The Giant Grampians: An Easter ascent of Ben Nevis:—summit views; Carn Dearg; the Northern Face; snow cornices and drapery; the Observatory under Snow; at work; the Burled Hotel; the Eastern Arête—the Braes O'Mear; highland castles; Jacobite associations; the Graves of the Clans at Culloden; Ben Muloch Dhu; snow crevasses in June; Braerach; lost in the mist; an Arctic summer day.—The Steep and Overgrown—of dark Lochracher; the Balmoral Forest; deer-stalking scenes; in winter's icy grip; the Great Corrie; giant lochies; summit views, etc.

SHEFFIELD MICROSCOPICAL SOCIETY.—A general meeting of this Society was held on Friday, March 29, in the Rutland Institute, before a crowded assembly of steel merchants, manufacturers, and chemists. Mr. John Newton Coombe occupied the chair. Professor Arnold, of the Sheffield Technical School, then gave his lecture on "Recent Researches in the Microstructure of Steel." (see report of the Sheffield Pharmaceutical and Chemical Society," at page 853 of this week's Journal). At the close, an interesting discussion took place as to the relative value of steel, etc., and an unanimous vote of thanks was accorded the lecturer.

THE VALUE OF CHEMISTS' SHOPS.—To secure eleven drug-selling shops in different parts of the Metropolis—the shops being held on lease—a joint-stock company has been formed under the title of the Lewis and Burrows' Drug Stores (Limited), with a capital of £100,000, some of it in cumulative preference shares, some in ordinary shares, and the once popular style of issuing a small number of deferred shares is adopted. The various vendors of these shops
—who are the promoters of the company—have fixed the purchase price for the lease, goodwill and stock, plant and fixtures of the several businesses at $16,500, in cash and shares. Three of the five directors, being vendors, will not act until after the completion of the purchase. Mr. J. E. Griffiths, who is set out as general manager, is also a vendor, and will have a seat on the board. The Statist, commenting on the above facts, says that it had not before seen that chemists’ shops, particularly in some of the localities, could have been valued up, lock, stock, and barrel, at so considerable a sum as the vendors expect to get.

The New President of the Queensland Pharmacy Board.—According to the Cambridge Chronicle, the President of the Queensland Pharmacy Board for 1895, Mr. Arthur Brand Chater, is the son of the late Mr. James A. Chater, of the Gouville Nurseries, Cambridge, and grandson of William Chater, the celebrated florist of Saffron Walden. Mr. Chater was born in Cambridge, and was apprentice to Mr. Church, pharma- cist, of the city. For two years Mr. Chater was with Southall Brothers and Barclay, of Birmingham. He went to Queensland in 1886, and shortly after his arrival established the firm of Thomason, Chater and Co., manufacturing and wholesale chemists and druggists, Brisbane. Mr. Chater was elected a member of the Pharmacy Board in 1892. He has for several years been on the Council of the Pharmaceutical Society, and has held the position of Honorary Treasurer for the past two years. In the earlier days of the College of Pharmacy, Mr. Chater was one of the lecturers, and he has privately coached a large number of pupils.

Inventors Chemists’, Assistants’, and Apprentices’ Association.—The annual supper of this Association took place on Thursday, March 21, at the Palace Hotel, Ness Walk, when about thirty-six gentlemen were present. The chair was occupied by Mr. W. J. Bethune. The Chairman was supported by Messrs. L. Macleod, J. Gregory, J. Don, M.A., B.Sc. Lond., R. Macleod, D. Mitchell, D. Shaw, D. Mackenzie, W. Machardy, E. Ballintyne, A. Ross, W. Scott, A. Smith, D. Gray, J. Mitchie, J. Dykes, G. Robson, W. Mackenzie. After the usual toast toasts had been drunk, the Chemists’, Assistants’, and Apprentices’ Association” was proposed by Mr. L. Macleod, D. Mitchell in reply. “The Chemists’ Association,” proposed by Mr. W. Machardy, replied to by Mr. L. Macleod. “The Burgh School Science,” by Mr. J. Don, M.A., B.Sc. “The Pharmaceutical Society,” proposed by Mr. Mitchell, the Chairman in reply. “The Ladies” by Mr. D. Macleod, replied to by Mr. J. Mitchie; and “Our Guests” proposed by Mr. W. Mackenzie. The musical members and friends of the Association provided an excellent programme. After the tables had been cleared, dancing was engaged in with much spirit until an early hour. The programme of the supper was one of the most enjoyable gatherings held by the Association.

Selling Unmineralised Methylated Spirit.—At the Mid-Lothian J.P. Court on March 26, Harry Jefferies, the licensed retailer of methylated spirits, Regent Arch, trading as Finlayson and Stuart, was charged, at the instance of the Inland Revenue, with having, on January 31, sold to John Jones, Inland Revenue officer, a pint of methylated spirit in which mineral naphtha had not been dissolved, contrary to the Customs and Inland Revenue Act, 1890, whereby accused was liable to a penalty of £50. Mr. Stuart pleaded guilty, and explained that the spirit had been taken by a boy from a cask used for manufacturing purposes. A fine of £5, with the option of one month’s imprisonment, was imposed.

Parliamentary News.

Weights and Measures.—At the meeting, a Tuesday, of the Select Committee of the House of Commons on Weights and Measures, Mr. H. J. Woolmer, of Manchester, expressed the opinion that the difficulties in the way of a conversion to the metric system in this country would not be great. In Germany 33 years’ notice was given of the change which was to be made, and it was found that at the end of two years even the working people were quite conversant with it. Manchester merchants hoped to sell according to metric weights and measures, if the necessary calculations involved a staff of clerks and additional expense as well as inconvenience. In this way, and also from the fact that a buyer preferred to buy from a merchant who dealt with the same weights and measures as himself, Reis trade was handicapped, as foreign merces were not slow to make use of this advantage. The necessity for a change of standard was more intense now than thirty years ago, because as more and more countries had adopted the metric system, not only because of the increasing keenness of competition. Mr. A. J. Street, chief inspector of weights and measures for the City of London, said that some large wholesale dealers, especially those transacting business with foreign merchants, greatly approved of the metric system, and practice it. They received a great many of their goods invoiced on the metric system, and converted the figures into avoirdupois, according to their requirements in this country, and conversely rendered avoirdupois into the metric system when exporting. In opinion, there were a great many wholesale houses as a number of bullion merchants who would welcome the metric system, but, on the whole, the retail trade were very much against it.

Food Products Adulteration.—Evidence was given before Sir W. Foster’s Select Committee a Tuesday, in reference to butter prosecutions and the importation of butter. Evidence was given that great improvements in Danish butter of late years was due to the action of the Danish Government. They had a large institution from which they sent out professors, teachers, and assistants to go through the country and instruct the farmers. They had also a representative in England, whose duty it was to see that nobody attempted to sell butter as Danish. He believed that the whole system of fraud arose from the mixing of margarine and butter, and he suggested that that should be prohibited. Mr. J. J. Thompson, another butter merchant of Manchester, spoke of margarine as a wholesome article of food.

Shop Hours Bill.—Sir John Gorst took the chair at a meeting on Tuesday of the Select Committee appointed to deal with this Bill, and Mr. C. A. Corry, secretary of the Scotch Shopkeepers’ and Assistants’ Union of Glasgow, said that at a special meeting of the board this Bill was considered and approved as being a voluntary Bill. He found shopkeepers, as well as assistants, were in favour of closing shops at definite hour by local option, but he did not think the Bill would be complete that did not contain a provision that the assistants should be protected. The Bill was then closed. Mr. T. W. Flint, from the same organisational gave similar evidence. Mr. Edward Day, of Wakefield, hon. secretary of the West Yorkshire Federation of Trade, also gave evidence.
SALE OF FELLOWS' SYRUP BY AN UNREGISTERED PERSON.

At the Carnarvon County Court on Wednesday, March 20, before His Honour Sir Horatio Lloyd, the Pharmaceutical Society of Great Britain sued Messrs. Evans and Lake, grocers, Carnarvon, for a penalty of £5 for selling poison contrary to the provisions of the Pharmacy Act, 1898.

Mr. R. E. L. Vaughan Williams, barrister, instructed by Messrs. Flux, Thompson and Flux, appeared for the Pharmaceutical Society; Mr. J. T. Roberts, solicitor, Carnarvon, appeared for the defendant.

Mr. Williams said he should prove that the defendant, not being registered chemists, had on January 23 sold a bottle of Fellows' Syrup of the Hypochlorite of Potash amongst other ingredients, strychnine, which was one of the poisons enumerated in the schedule attached to the Act. Although, as a matter of fact, the wrapper of the bottle bore a label to the effect that the preparation contained strychnine, yet he submitted that it was not necessary for him to prove that the defendant knew that the article they sold was a poison. The defendant had been in correspondence with Messrs. Flux and Co., and had pressed them to disclose the name of the purchaser; but that, of course, for obvious reasons they could not see their way to do.

Mr. Roberts contended that he should deny the sale, and also raised the technical objection that the letter claiming the penalty was not properly framed, in that the particulars charged them with selling the medicine, but did not state that they were not chemists.

His Honour: If you can prove that you are registered chemists and druggists there is an end of it.

Mr. Roberts: They were charged with "selling" or "keeping open shop," and he wished to know which charge the Society intended to proceed upon.

His Honour: You might do both.

Mr. Roberts contended that he ought to be definitely charged with either selling or keeping open shop, that he might conduct his defence accordingly.

His Honour: That will no doubt come out in the evidence. If, however, at the conclusion of the case you are still embarrassed I will ask the plaintiff to enlighten you.

Mr. Thomas John Hughes, chemist, of 4, Ogwen Terrace, Bethesda, stated that on January 23 he went to Carnarvon to the shop of Messrs. Evans and Lake and purchased a bottle of Fellows' Syrup and a pennyworth of sweets. The bag of sweets produced was the one purchased by him; it bore the name of Evans and Lake, the name was also over the shop. The bottle of Fellows' Syrup was wrapped in an outer covering of tissue paper, through which he could see the label.

The descriptive label stating the syrup contained strychnine was here read by the counsel.

Mr. Hughes continued: On January 3 I wrote to the Society stating that I had made the purchase, and on February 27 Mr. Moon came to Bethesda and fetched the bottle away.

Cross-examined by Mr. Roberts, witness stated that he also sold Fellows' Syrup at his own shop, and on being asked who sold him the article at Evans and Lake's he knew of no such person. Mr. Evans and Lake, said that they used to sell large quantities of Fellows' Syrup. When they found from time to time that articles they were selling were in the list of poisons they withdrew them from sale. Fellows' Syrup was withdrawn more than a year ago.

Cross-examined: I do not know about poisons myself, but we know when a medicine contains a poison and must be withdrawn from sale by seeing an account of the conviction in the newspapers. When he removed the bottles from the shop he locked them.
up in his office. They also had a business at Bangor and had given instructions that Fellows' Syrup should not be sold there. The instructions might have been given after they had been charged with the offence.

Mr. Vaughan Williams then addressed the Court, and in the course of his remarks alluded to a letter from the defendants promising to give an undertaking not to offend in the future if these proceedings were abandoned. He said that the Pharmaceutical Society could not agree to this course, or the result would be to make the Act almost a dead letter. The effect of a successful prosecution was very valuable in deterring others from offending, and might well be seen from Mr. Lake's own evidence. With reference to the technical objection as to the terms in which the offence was described, he maintained that sale by agent was equivalent to keeping open shop, and in support of that statement he referred the Judge to the decision of the High Court in the case of Pharmaceutical Society v. Horseyn.

His Honour said he should carefully read the decision in that case and also in the Wheelton case, and meanwhile reserved judgment.

**Notes and Queries.**

**To Flavour Cod Liver Oil.**

[881.] Oil of eucalyptus, 1 p.c., is added to cod liver oil by Duquesnel (Jour. de Pharm.), and is said to hide its odour and taste. A more elaborate process is suggested by Parisi (Presse Médicale), viz., mixes cod liver oil, 400 Gm., freshly roasted at ground coffee, 20 Gm., and animal black in power of 2 Gm., in a stoppered vessel, and warms it on a water bath at a temperature of 60° for a quarter of an hour. The mixture is then left for two or three days, except that it is shaken from time to time and, finally, filtered through paper. The protest is described as amber-coloured, and as having a distinct odour and taste of coffee.

**Thyroid Pills.**

[882.] Dried and powdered thyroid gland may be made into pills by the following formula (Merc. Bericht), the quantities sufficient for thirty pills: Dried thyroid gland, 32 grs.; kaolin, 22 grs.; vanillin, 1/8 gr.; tragacanth mucilage, q. a. The pills should be coated, and two or five may be administered daily.

**Preservation of Syrups.**

[818.] Having been struck by the keeping properties of syrup of tolu under the most disadvantageous conditions, Cesaris (Boll. Chim. Farm.), 1891, attributes its stability to the presence of benzonic acid, and recommends the addition of 1 per cent. of the acid to syrups prone to ferment.

**Gallows for Fertile Breath.**

[890.] The following formula is given in the Annales de Pharmacie:—Sesochrin, 1 Gm.; sodium bicarbonate, 1 Gm.; salicylic acid, 4 Gm.; alcohol 200 Gm. Dissolve and add a few drops of the solution to a glass of water. Other suggested remedies all to be used as gargles, are a weak solution of potassium permanganate; an infusion of sage leaves; or a decoction of camomile leaves, with 5 p.c. chlorine water, 10 p.c. of glycerin, and a few drops of tincture of myrrh or lavender added.

**Dispensing Phosphoglycerates.**

[883.] Phosphoglycerates, according to Merci (Bericht), decompose in contact with carbonates, phosphates, and lead salts. The free acid decomposes on heating also, though the salts do not. Heat precipitates the lime salt from its aqueous solution on heating, but it is re-dissolved on cooling. In solutions to be preserved any length of time they must be sterilised, as they form a very favourable nutritive medium for bacteria.

**Syrups of Phosphoglycerates.**

[824.] Numerous formulae for preparations of phosphoglycerates are being published, and syrup seems to be most favoured, whilst the calcium salt is in chief demand. A formula in the Journal de Pharmacie is as follows:—Calcium phosphoglycerate, 10 Gm.; citric acid, 1 Gm.; sugar, 60 Gm.; water, 340 Gm. Dissolve the salt and acid in the water, add the sugar, and heat until dissolved, then make the product up to 1000 Gm. with syrup of oranges. Another formula is given by Merci (Bericht):—Rep. Calcii glyc-phos. 50 Gm.; ac. dec. fijii; sq. ment. pip. 3 fl.; syrup. simp. 5 fl.; jujubes three or four times daily. As a pill mass, take of calcii glyc-phos., grs. 48; terre alisece, grs. 1; syr. althes, q. a. M. ut. f. pilulo xx. Silver. Syr. —One pill three times a day. For a syrup containing iron, take of ferri glyc-phos., grs. 3; ac. dec. fijii; syrup. simp. 5 fl., Sig.—In a glass of water.

**Personal and Trade Notes.**

Mr. J. Harris Burns, who gained the last Edinburgh Chemists', Assistant, and Apprentices' Association Prize, admitting him to Dr. Stevenson Macadam's chemistry lectures at Surgeon's Hall, has been awarded the Silver Medal. He has just completed his apprenticeship with Messrs. H. C. Baldwin and Son, 78, Princes Street.

Mr. Henry Dunn, Pharmaceutical Chemist, Local Secretary for Shipleys, has been re-elected as the representative of Shipleys on the West Riding County Council. At the first meeting of the new Council, held March 18th, Mr. Dunn was elected to the position of Alderman. He is also Vice-Chairman of the Shipleys Urban District Council.

Alfred John Gower, and John Thomas Emerson, chemists and druggists of Halstead, Essex. The business will be carried on by J. T. Emerson.

Alfred Cox, and John Henry Montague, carrying on business as surgical instrument makers, at 108, New Bond Street, London, W., under the style of C. Wright and Co.

Thomas Beecham and Joseph Beecham, carrying on business as manufacturers and vendors of proprietary articles known as Beecham's Pills, Beecham's Tooth Paste, etc., at St. Helen's, Lancashire, under the name of Thomas Beecham. The business will be continued by Joseph Beecham under the same style and name.
Poisoning Cases and Inquests.

Chlorodyne.—At Emily Oliver, aged 25, died on Sunday, March 17, at 4, Carlyle Road, Brentford, from the effects of chlorodyne, self-administered. Verdict: "Suicide whilst of unsound mind."

Poisonous Lignum.—Joseph Yates, aged 64, died at 63, Liverpool Road, Patrilofton, on Thursday, March 21, from the effects of a poisonous lignum, taken in mistake for his medicine, both obtained from the Medical Association at Patrilofton. Verdict: "Death from misadventure," and a resolution was passed to the effect that the Medical Association be desired to discontinue the use of any bottles containing lignums or other poisonous ingredients except such as by their shape, colour, or other means give warning of their contents.

Arsenic.—John Burns, aged 52, died on Saturday, March 16, at 129, Fritchote Street, Birmingham, from the effects of arsenic, self-administered. Verdict: "Deceased took the poison in an unsound state of mind." A rider to the verdict called attention to the fact that the arsenic was supplied without the signature of the purchaser.

Prussic Acid.—Edward Alfred Woolley, aged 47, died on Saturday, March 23, at the First Avenue Hotel, London, from the effects of prussic acid, self-administered. Verdict: "Suicide whilst of unsound mind."

Prussic Acid.—Dr. John Mackie, aged about 55, died at his residence in Brochis, on Sunday, March 24, from supposed prussic acid poisoning.

Trade Correspondence.

[Under this heading the Editor proposes to publish letters dealing more especially with the trade aspects of pharmacy. Correspondents should write on one side of the paper only, and as concisely as possible, preferably with name and address for publication.]

MINIMUM CUTTING PRICES.

Sir,—The increasing publicity given to new tariffs of retail charges by certain proprietors of extensively advertised and unusually unhappy designation of minimum cutting prices, marks the advance of a movement which is of considerable importance to retail chemists and druggists.

It will perhaps be conceded that the firms who have taken so much trouble to arrive at what they consider to be practicable schemes for the prevention of "ruinous competition" are desirous, for various reasons, of attaining a base of action which shall be beneficial to the ordinary retailer as well as to themselves, hence the enforcement of stipulations of which the subscribers are pledged not to sell certain articles below certain specified prices, but at the same time are allowed free action to charge the full advertised retail price, or as near that mark as may be deemed expedient. It appears to me, however, to be inevitable that sooner or later the so-called minimum cutting prices will be well understood by the consumer, and will be held to be the proper retail price for articles sold under such arrangements.

Already I notice that one firm at least is extensively advertising a popular line of their goods in the magazines and daily papers at the minimum price, which sufficiently illustrates the truth of my contention.

Upon the margin of profit which is allowed by one firm or another, or, as to whether the goods are worth selling at the new rates, etc., I would prefer not to enter, but the principle involved and its practical bearing upon the work of the retail chemist and druggist is worthy of consideration, because it so happens that he is a factor in the arrangement by which the goods in question are distributed to the public. It appears to me obvious that a general extension of the system will only tend to exaggerate the friction which exists between the chemist and his customers in dealing with proprietary goods, until the adjustment between the retail price advertised and the retail price fixed by its producer as a minimum becomes absolute, and will have been fully carried out everywhere, to ascertain the value of their articles and affix a retail price; that price being usually a necessary part of any advertisement calling attention to the articles. In cases where the proprietors have been retailers of their nostrums as well as manufacturers and wholesalers, the prices specified upon the labels have been adhered to by them. When, however, they advertise the article at the same retail price as before, and simultaneously agree to a schedule of prices other than those which they have all along considered to be equitable, it then becomes very difficult for the retailer to show any sufficient reason why the original price should be upheld. Consumers will gradually become restive of the arrangement, and argue that retailers are bound to accept the minimum rates as consenting parties to the agreement. The position of the retailer, under those circumstances, compares unfavourably with that of purveyors of goods without condition. In my judgment it is less easy to defend. By promoting such schemes, proprietors will damage their own interests.

The mere signing of an agreement not to sell goods below certain rates is not fair, do nothing towards the attainment of uniformity so long as there is an adherence to the custom of advertising a retail price which there is no endeavour, nor apparently desire, to conserve.

R. W. LEBURN.

CHARLES B. ALLEN.

Obituary.

Notice has been received of the death of the following:—

On February 24, Gilbert H. N. Allott, Chemist and Druggist, formerly of Maidstone. (Aged 57.) Mr. Allott died at Jubbulpore, Central India, and he was a representative of Messrs. Horner and Sons, wholesale druggists, London.

On March 16, Edward Grant, Chemist and Druggist, Exeter. (Aged 75.)

On March 16, Richard T. C. Fuller, Chemist and Druggist, Williscroft. (Aged 60.)

On March 19, James Thyer, Chemist and Druggist, Hull. (Aged 59.)

On March 19, Arthur Theodore Watson, Chemist's Assistant, Sheffield. (Aged 22.) Mr. Watson died under painful circumstances. He was a student at the Sheffield School of Pharmacy, and had started for a walk with about a score of other students. When in the wood at Handsworth he threw up his arms and fell to the ground. Dr. Mason, of Handsworth, on reaching the wood, pronounced life extinct. We understand that the deceased had entered for the Minor examination to be held in April next.

On March 20, G. W. Sargent, Chemist and Druggist, Wensington, W. Mr. Sargent will be remembered for the notoriety he acquired as a writer of objectionable letters, and as the defendant in an action in which Mr. Bottle, of Dover, sued him for libel. He was found unconscious behind his shop counter on Tuesday, March 19, and removed to St. George's Hospital, where he died the next day.

On March 20, William Canning, Chemist and Druggist, Birmingham. (Aged 83.)

On March 20, Walter J. Pridgeon, Chemist and Druggist, Hawkhurst. (Aged 57.)

On March 21, Phillips Spencer, Chemist and Druggist, The Grange, Upton. (Aged 58.) Mr. Spencer for a great number of years carried on a wholesale business in Low Friar Street, Newcastle-on-Tyne, but a short time ago he retired from the concern in favour of his manager, Mr. Dakers.
Patent Office Business.

No. 5197.—Apparatus for deodorizing fats and oils. March 19, 1896.

No. 5200.—Improvements in label holders. March 19, 1896.

No. 5306.—An improvement connection with photographic cameras. March 19, 1896.

Patents Published During March.

Precipitating gold, etc., from solution (MacArthur, J. S.).—The invention relates to the precipitation of gold and other precious metals from solution in potassium cyanide, by means of zinc. The presence of copper in the solution is found to render the precipitating action of the zinc slow, but the inventor claims that if the zinc be coated with spongy lead by immersion for about a minute in a solution containing about 1 per cent. of lead, this retardation does not occur. Finely divided lead or lead shot may also be employed, especially when mercury is present, but any other agent such as tin, iron, or carbon which is negative to zinc and induces an electric action may be used. No. 5184 of 1896.

Paraffin burner (Clerks, A. B. H.).—The apparatus consists of two face-plates fixed on a wooden back-piece and covered with a textile material. Through the covering pass a number of studs, those of each face being connected together by wires, and having connection with wires passing to a source of electricity. When the appliance is fitted to the body the electricity passes from one set of studs through the body to the other, and the arrangement is such that it may be moved from place to place or rubbed upon the body while the current is passing. No. 5238 of 1896.

Vessels for chemicals, etc. (Apps, A.).—The vessel or case has in the cover or elsewhere an indiarubber or other membrane which permits the contents to expand without leakage, although the vessel be full. No. 5892 of 1894.

Full bottles (Thompson, W. P., communicated by Lamprecht, R.).—The neck of the bottle and the hollow stopper, which is fixed at the top, are so shaped that, by inclining the bottle and turning the stopper, the pills pass singly through an opening near the bottom of the stopper into the interior of the same, from which they may be dropped out. The stopper may have a removable cap, and may then be used for retaining a number of pills. No. 9190 of 1894.

Artificial legs (Hosacke, W. R.).—The joints connecting the foot and the leg to the leg are so arranged by means of hinges, sockets, and indiarubber and other springs, that a life-like spring is given to those parts in walking. No. 15,009 of 1894.

Diet for the sick (Ferrier, O.).—The invention relates to means for digesting, fractionating, and condensing resins, scatoic and other fatty acids, alcohol and spirits, etc. The still consists of one or more horizontal or inclined cylinders divided along their length into compartments of graduated height so that the liquid passes gradually from one to the other and finally escapes. The liquid is kept in motion by

palettes, and the heating arrangements are such that the liquid is exposed to a gradually increasing temperature until the residue escapes. As regards the condenser, the vapours pass through an "analysing" made in a number of superimposed compartments in which the various fractions of the distillate condense. The compartments are filled with beds to expose a large condensing surface, and are each covered by a passage filled with a cold liquid, which, varying the boiling point of the fraction which it is desired to condense. No. 20,175 of 1894.

Bottle-stoppers, Securing (Rahdale, J.).—For preventing the screw-thread from opening the potion and other small dispensers, etc., the inventor uses a cap or cover consisting of two capsules, one of which fits over the other. On pressing down the outer capsule, claws on the other are caused to grip a flange on the bottle and over the cork, and by means of a pull-out, spring lock, etc., it may be prevented from being raised. No. 24,262 of 1894.

Reducing zinc blende, etc. (Roux, M. A. J., and Delmanco, J. M. A.).—The invention relates especially to such blends as contain silver. The finely divided blende is mixed with lithium or other lead oxide and fused is a retort or crucible. The reduced lead comes in with the silver and soap is drawn off from the molten. The residue which contains the zinc, is mixed with blast-furnace slag or other flux and fused while air, steam, or other oxidising gas is blown through. The zinc is converted into oxide and may be skimmed from the surface. No. 1322 of 1896.

Dental appliances (Lake, H., communicated by Methot, L. T. E.).—The invention refers to arrangements for operating dental instruments which require to be revolved by means of an electric motor. The instrument is carried in the hand, and is revolved by an endless cord worked by a motor fixed on a bracket on the wall of the room. No. 2023 of 1895.

Burners burner (Seel, C.).—The burner is fitted with a vaned wheel, which is rotated by the passage of the gas and which mixes the air and gas, and expels them in such a manner that a long cylindrical flame is produced. This burner is intended for ordinary use, but especially for "green lighters" or incandescent gas-burners. No. 346 of 1895.

Trade Marks Applied For.

No. 156,161.—"VÖRCKER."—Chemical substances used in manufactures, photography, or philosophical research, and anti-corrosives.—Louis Sinclair, Daydawn, Netherton, Hampstead, London. February 25, 1895.

No. 156,163.—"PARADISE BAY."—An intoxicating and stimulating beer. A bird of paradise on a bough. Chemical substances used in manufactures, photography, or philosophical research, and anti-corrosives, but not including any goods of a like kind to dyers. —Thomas Shaw, Street, Long Lane, Borough, London. January 26, 1895.

No. 156,594.—"SPIEPPON."—Chemical substances used in photography, or photographic research, and anti-corrosives.—Spies and Pond, Limited, 1 New Bridge Street, London, E.C. February 14, 1895.

No. 156,596.—"SPIERPON."—Chemical substances used for agricultural, horticultural, veterinary, and sanitary purposes.—Spies and Pond, Limited, 26, New Bridge Street, London, E.C. February 14, 1895.

No. 156,571.—"A.XA."—Medicine for animals.—William Henry Beach, East Castle, Bridgnorth, Salop. February 27, 1895.

No. 156,585.—"STAMA," with name and address of owner and other words and figures destructive to Stama for human use.—The Stama Mfg. Co., 54, Oxford Street, London, W. January 30, 1895. The essential particular is the word "Stama." No. 156,584.—"KESTERON" and device.—A key or key:..—Chemical substances and compositions of substances used in medicines and medicines, and in the manufacture of medicines.—Stephen Smith and Company, 78, Malt- bury Road, Bow, London, E. January 30, 1895.

SUPPLEMENT TO THE
Pharmaceutical Journal and Transactions.

LONDON, MARCH 23, 1895.

MARKET REPORT.

Chemicals and Drugs.

[The quotations here given are in all cases the lowest net cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the pharmacist. It is important that this should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.]

THE CHEMICAL MARKET.

THURSDAY, MARCH 21, 1895.

There have been but few changes in the Chemical Market since our last, and the amount of business done has been but small. Any alterations that have occurred have been for a fall. Citric acid continues firm but quiet at unchanged rates, whilst tannic acid has proved in steady demand, especially the foreign brands. Oxalic acid is in fair demand, whilst with regard to ammonium compounds, no improvement has been shown in sulphate, as it has presented a very weak market throughout, and close at a fall on last week's low rates. Carbonate of ammonia and sal ammoniac are unchanged. Chlorates are steady at the previous rates, whilst borax continues a weak market, the official rates being higher than in second hand. Copper sulphate is in fair demand at unchanged rates, this also applying to cream of tartar. Mercurials are unchanged, whilst quicksilver in second hands is fractionally easier. Pottas and soda compounds are all exceedingly quiet, the market in chlorate of potash especially being very weak.

ACID BORICUS.—Crystals are worth 30s., powdered, 31s.

ACID CITRICUS.—Quiet, but the quotations are unchanged. It is returned at 1s. 1½d. to 1s. 2d., according to quality.

ACID OXALICUS.—Supply and demand fairly balanced. It is still quoted 3½d. net, ex rails.

ACID TARTARIC.—There has been a fair amount of business done at unchanged rates, especially in the foreign brands. Quotations of English makers are still 10½d. to 11d. Foreign ditto, both powdered and crystal, 10½d.

AMMONIA SALT.—Sulphate: Very weak market since our last, and prices have still further fallen. At the close it is returned at 2½d. for grey 54 per cent. Carbonate: Unaffected by the dull tone of sulphate, and is still quoted to 3½d. to 3½d. Sal ammoniac: Unchanged, first quality is still returned at 36s., seconds at 37s.

Ashes are unchanged at steady rates. Prices returned are 40s. for Americans, with pots at 23s.

ASBESTIC.—The quotations are sufficiently maintained at 15s. for powdered white.

BLEACHING POWDER.—A fair amount of business has been done, the quotations, 8s. 5d. to 8s. 6d., still holding.

BORAX.—The demand continues dull. Syndicate prices are still 23s. for crystals, and 23s. powdered, but second-hand holders are selling 8d. per cw. lower.

COPPER SULPHATE.—In fair demand, without change. Quoted at 4½d. 6d. to 2½d. 10d., according to brand.

CREAM OF TARTAR.—Quotations are fully maintained at last week's rates, and a fair amount of business has been done. Finest French white Crystals are worth 65s. 6d., whilst the quotation for German Powder on the spot is 65s. 6d. to 66s.

MERCURIALS.—Unchanged. Quantities up to 26 lb. are still quoted at: Calomel, 2s. 9½d.; red precipitate, 3s.; white ditto, 3s.; corrosive sublimate, 2s. 6d.

POTASH COMPOUNDS.—The market is easy all round. Prussiates Unchanged, the quotations still being 8½d. Chlorate: The market continues very weak and little business has been passing at last week's minimum rates of 4½d. Bichromates: Unchanged at 4½d. to 4½d.

QUICKSILVER.—Importers' prices are still £5 10s. in second hands. It is fractionally lower at £5 9s. Saltpetre: Spot quotations for Bengal 8 per cent. are 12s. 6d., and it is steady at that rate. British refined is worth £2 6d. to £2 10s. 6d.

SODA COMPOUNDS.—Ch virtue Salts: 70 per cent. is worth £2 with 27 paid for 60 per cent. Crystals: Unchanged, at 35s. Bicarbonate: £7 5s. (London). Hypobromite: Steady, at £5 5s. in 1 cw. kegs (Liverpool).

THE DRUG MARKET.

THURSDAY, MARCH 21, 1895.

The drug sales were held to-day, but few changes of interest occurred. The tone of the market was generally dull, and a large proportion of the drugs offered were bought in. Aloes were in poor supply and sold fairly well. Buchu leaves were entirely neglected. A fair amount of business was done in seafordia and ammonium. Benzol was very dull. Calumba sold at extraordinarly low rates. Cardamoms were in large supply, and the majority found purchasers at good prices, some extreme quotations being obtained. Dragon's blood in seeds fetched fancy prices. Mony was not in large supply, but some good prices were obtained. Ipsomammas was largely offered, but little changed hands, although the prices realised show a decline. Eucalyptus oil was largely offered, but all was bought in. Wax was largely offered and some good figures were obtained. During the week, crude camphor has advanced considerably, and closes very firm. A corresponding advance in the refined articles probable. Cocaine also has far advanced from 18s. 9d. to 20s. 6d., and is very steady at that rate. Caffein is firmly held and in poor supply.

ACACIA.—Very quiet. In fair supply, but the majority of that offered was bought in. Out of a quantity of 60 per cent. eight casks sold at 50s. to 50s. 6d. for glazed palelum lumps. The remainder of this lot was bought in at 10s. to 15s. according to quality, and the品格 consisting of picked and sorts Turkey gum was all bought in; fine white picked gum at the rate of 12s. 10s. White Mogador gum was bought in at 20s., with Australia at 20s., three cases of good white gum sold without reserve at £2 10s., with yellowish lumpy at £2 15s. Good soft yellowish sorts sold at 70s.

ACONITE.—Fifteen bags Japan root bought in at 25s.

ALOE.—In but moderate supply. Of a parcel of twenty-five cases of Cape offered five were sold at 12s. to 15s. for ordinary dryness qualities, three more at 17s. 6d. subject. A parcel of sixty-nine bags of Scopolia offered were all bought in.

AMMONIUM.—In fair supply, but all bought in, the rates being 35s. to 36s. for mixed blocky and tears; and 45s. for slightly blocky.

ANIS.—Twenty bags ex. Oriental at Bombay sold at 25s. Forty bags of Cyprus seeds were bought in at 25s.

ARMATTO.—Bought in at 15½d. to 4½d., according to quality.
ANTIMONY.—Crude Japan was bought in at £13 10s.

ASEPTICIA.—Largely offered to-day, the majority being bought in.

BAKING.—In plentiful supply, mostly bought in. Seven cases Siamaco gum sold without reserve at 50s., to 52s. 6d. for mixed dark bloomy. Eight cases Semauro gum were bought in at £20 15s., after a bid of £10 had been made.

BROW.—A moderate supply of the long variety to-day, but all was bought in.

COLUMB.—Sold at very low rates. Eighty bags good bright washed root sold at the low price of 7s.

CARDAMOM.—There was a plentiful supply to-day, and the majority sold at good prices, as follows: Ceylon Mysore, medium to bold, fine pale, 5s. 7d. to 3s. 6d.; ditto fair colour, 2s. 9d. to 3s. 3d.; medium, good pale, 2s. 9d. to 3s. 3d. Wild Ceylon: fine bold, 2s. 9d. to 2s. 11d.; smaller ditto and darker, 1s. 10d. to 1s. 11d.

CAPPARIS.—Remains very steady, and is firmly held. Normally the manufacturers' prices remain as last reported, i.e., 1 cwt. lots at 15s.; 28 lb. at 15s. 6d., and smaller wholesale quantities at 16s., but it would be difficult to place an order at these rates, as there is no sport delivery.

CAMPHOR (crude) —Quotations show a marked change since our last report, a considerable advance having taken place. Chinese (Fomoss) camphor is to-day quoted at 105s. 6d. to 105s., c.i.f. and Japanese at 115s., c.i.f. distant shipment.

CAMPHOR (Refined) —Consequent upon the advance in the crude material, there is a very firm tone in the market for refined camphor, and an advance is extremely probable. At present, however, the quotations remain the same as last. German and English makes in bolls and flowers being returned at 1s. 5d. 4d. for 10 cwt. lots, with square at proportionate rates.

COCAL.—As was last week considered probable, the manufacturers have still further advanced their prices to 20s. 5d. for Angoracovette, and it is firmly held at that rate. This quotation is for 100 oz. lots, smaller wholesale quantities being returned at 20s. 6d.

COOKER.—Is steady at the unchanged rates of 12s. 3d. to 12a. 6d., second-hand holders quoting at 12s.

CASCARA.—Fifty-three bales of good bright bark were bought in at 20s., after a bid of 17s. 6d., thirteen bales sold at the rate of 15s. to 15s. 6d.

CICAROIA.—Sixteen seven Crown bark bought in bales at 11d. 9d. to 2d., with first-class, damaged, at 8d. Another parcel of twenty-three seven Crown bark sold at the rates of 5s. 6d. to 8d., with first quality at 11s. 6d.

COCA.—Bought in at 1s. 1d.

COLOMTH.—Five barrels fair, smallish Turkey apple sold at 11s. 1d. to 1s. 4d.

CURRY.—Of a parcel of 39 bags ten sold at 45s., the remainder being bought in at 50s.

CUTTLING.—Bought in at 2d.

DRAGONS BLOOD.—One case fine bright fiery in reeds sold at £12 10s. Good bright lumpy was bought in at £9 10s.

HONEY.—Ten cases Jamaica were bought in at 25s., with another case at 15s., and another case at 20s. A case of Australian honey sold at the same figure, and twenty cases of Californian at 41s.

IRELAND.—Largely offered to-day, but met with little demand. Rio (Brazilian): roots sold at 4s. to 4s. 3d. for fair anualuted root down to 3s. 9d. Cartagena (Columbia): root sold at 3s. 5d. for fair plump, first and second class damaged qualities.

JAP.—Ten cases of fair Vera Cruz bought in at 1s. 5d., that representing the limit.

JAPAN.—Sixteen bales sold without reserve at 25a.

KOLA.—Nuts sold to-day at 1s. 1d., with fair to medium at 1s. 6d.

MENTHI.—Is firm at an advance of 6d. Good white crystals are now quoted at 15s. 6d. spot, whilst forward rates are 14s. 6d. to 15s., c.i.f. terms, but there is hardly any offered for delivery.

MORPHINE.—Unsought at the nominal rate of 5s.

OILS (Essential).—Aniseed: A very firm market at advanced rates, with a tendency to go higher. It is now firmly held at £5. 2d. on the spot. Cassia: Steady, at unchanged rates, quoted at 5s. 9d. to 4s., according to percentage of cassia skypew. Peppermint: H. G. Bickham's brand is steady, at 5s. 6d. to 5s. 9d. Japan oil containing 40 per cent. of menthol is fairly steady at 6s. 5d. to 8s. 6d. Two cases of Cocky's Japan oil were bought in at to-day's sales at 7s. 6d. toisehined oil is firm at 7s. Lemon oil is firm, 1s. 6d. representing a fair quotation for a brand of guaranteed pure Lemon-gum, in fair demand at 1s. 6d. to 1s. 7d. Six cases of lime oil, offered without reserve, sold at 1s. to 1s. 9d. Clemene is mostly bought in, but five cases sold without reserve at 1s. 6d. one case reputed genuine olive oil was sold at 5d. subject. heis was bought in at 5s. Bergamot: Seven cases sold at reserve at 3s. 10d., but fine essence was bought in at 5s. Geranium: Seven pots E. L. oil were bought in at 3s. 6d. to 3s. 8d. Indian essential oils are very firm, and the prices will steadily maintained, especially oils of lemon, bergamot and oranges.

OILS (fixed) and SPIRITS.—Castor: Sixty cases white base oil were bought in to-day at 3s. 6d. Castor-oil OIl: The market is very weak. Best new non-compressing oil is worth £10 per barrel of 25 gallons, c.i.f. terms, whilst a fair quality is prime oil would be 100s. on the spot. Twenty-three cases of new Castor oil was offered to-day, and were bought in at 20s. to 25s. of old Nonfuhland oil were bought in at 5s. 6d. per barrel, the limiting being 4s. 5d. per gallon. Almond: The price is now advanced 1d. per lb., and English expressed oil is now quoted at 1s. 6d. Linseed: Earlier in the week a considerable fall occurred, but the tone is now steadier, and it is quoted at £2 6s 5d. Coconuts continues fairly steady at last week rates, and it is quoted at £1 15s. to £1 17s. 10d., according to brand. Olive-oil: Ceylon is quoted at £2 2s. 6d. Cochine, £2 15s. Ar- ritis, £2 2s. Rapese presents a very strong market. Rapeseed oil is now worth £2 5s. 6d. to £2 10s. Puritan: Being a poor donor and this is considerably lower, and American rape is now quoted at 22s. 10d. to 25s. Petroleous: Very low, at a advance. American oil is worth 5s. 6d. to 5s. 10d., with hose at 4s. 5d. to 5d. Petroleous Spirit, ordinary, 7d., deodorised 7½ to 7½d.

OPHIA.—A fair amount of business has been done at last week's prices. Quotations: Turkeys, soft shipping description 12s. to 13s. 6d.; best drygates' 10s. 6d. to 10s. 10d.; seconds 8s. 6d. to 9s. 6d.; Persian 11s. 6d. to 12s.

ORANGEPEEL.—Good bright thin cut Maltese peal sold at 9d.

POLGANAPPE.—Quotations are very well maintained, 9d. security continues inducing. Hydrocyanate and winner are worth 7d. to 8d. per gramme.

QUASSIA.—Sixty bags were sold at 67 per ton.

QUININE—Remains quiet, but the quotations are very steadily maintained. Brazilwick and E. & E. are quoted at 11½d. to 11½d., with little doing at these figures.

RHUBARB.—Dull of sale, although largely offered. Seed: Round small to bold, 1s. 9d. to 1s. 7d.; other qualities der 10d.

SARPAPULLA.—Jamaica sold to-day at 9d. Lime: Ten bales sold at 8s. 6d. to 8s. 6d. Rumbourough was bought in at 1s. 6d.

WAX (Japan).—Twenty-eight cases sold to-day at 2s 6d.

WAX (Carrube).—Bought in at 6d.

WAX (Bruce).—In good supply. Beachet E. L. wax was knocked down at 6s. 2d. 6d. subject. Australian wax: Seven cases mixed yellow, white and dark, sold at £7 10s. to 7s. 10d. Japanese wax, 40s. £2 7s. 6d.

WAX (Vomica).—Twenty-eight bags sold at 9s.

COTTON SEED.—Bought in at 32s.

ROSE WATER.—Twelve carboys sold without reserve at 2s 8d. gallon.

TAMARIND.—A parcel sold at the extraordinary price of 1d., which would hardly cover charges.
Late News.

ROYAL INSTITUTION.—The following are the lecture arrangements after Easter:—Professor George Forbes, three lectures on “Alternating and Interrupted Electric Currents”; Professor E. Ray Lankester, four lectures on “Thirty Years’ Progress in Biological Science”; Professor Dewar, four lectures on “The Liquefaction of Gases”; Dr. William Huggins, three lectures on “The Instruments and Methods of Spectroscopic Astronomy” (the Tyndall Lectures); Mr. Arnold Dolmetsch, three lectures on “Musical Instruments of the 16th, 17th, 18th, and 19th Centuries”: 1. English; 2. French; 3. Italian.” (With illustrations upon original instruments); Mr. Seymour Lucas, “Two Lectures on Picture Making”; Professor Edward Dowden, “Two Lectures on Elizabethan Literature: 1. The Pastoral; 2. The Masque.” The Friday evening meetings will be resumed on April 26, when a discourse will be given by Dr. J. Hopkinson, on “The Effects of Electric Currents in Iron on its Magnetisation;” succeeding discourses will probably be given by the Earl of Rosse, Veterinary-Captain Frederick Smith, the Hon. G. N. Curson, M.P., Professor Walter B. Raleigh, Mr. J. V. Pirie, Jones, Professor Alfred Corne, and other gentlemen.

GREENOCK PERSONATION CASE.—At the Greenock Sheriff Court, on Thursday, the sheriff issued an interlocutor in the case of Conner v. Calms, adhering to the judgment of the Sheriff-Substitute, with additional charge for the defender.

NEWCASTLE-ON-TYNE PHARMACY CYCLING CLUB.—A meeting of chemists and assistants was held on Tuesday evening, 19th inst., at 55, Northumberland Street, Newcastle-on-Tyne, for the purpose of forming a cycling club. There was a representative attendance, and Mr. T. Malby Clagge occupied the chair. It was decided to start the Newcastle-on-Tyne Pharmacy Cycling Club. The following office-bearers for the current year were elected:—President, Mr. John Bolam; Captain, Mr. John Shaw; Vice-Captain, Mr. J. As. Davidson; Secretary and Treasurer, Mr. A. Russell Bennett; Auditor, Mr. Geo. F. Manson; Committee, Messrs. Well, McCusker, and Wilson. Rules, etc., were drawn up and approved, and other preliminary business was transacted. Over twenty members were enrolled, and a vote of thanks to the Chairman terminated the meeting.

New Books and New Editions.

Publishers are invited to forward full particulars of new publications, including price.

THE SCIENCE AND ART OF SURGERY. By Sir John Eric Erichsen, Bart., F.R.S., LL.D., etc. Tenth Edition revised by the late Marcus Buck, M.S., M.B., and Raymond Johnson, M.B., B.S. Illustrated by nearly 1000 engravings on wood, two vols., price 48s. (Longmans, Green and Co., London.)

A POPULAR TREATISE ON THE PHYSIOLOGY OF PLANTS. By Dr. Paul Soraer. Translated by Professor F. E. Weiss, B. Sc., F.L.S. Pp. 266, and 48 illustrations. Price 16s. net. (Longmans, Green and Co., London.)

THE ELEMENTS OF PATHOLOGICAL HISTOLOGY. By Dr. Anton Wiechelsraum. Translated by W. R. Dawson. M.D. Pp. 473, with eight plates and a large number of illustrations in the text, some of which are coloured. Price 21s. net. (Longmans, Green and Co., London.)

AN INTRODUCTION TO THE PHILOSOPHY OF HERBERT SPENCER, with a Biographical Sketch. By William Henry Hudson (London: Chapman and Hall.)

THE SOURCES AND MODES OF DERIVED ENERGY THROUGHOUT THE UNIVERSE. By J. W. Heisinger, M.A., M.D. (Lippincott Company, Philadelphia.)

Personal and Trade Notes.

The Cerebos Salt Co., Limited, offer a reward of £10 for the most suitable motto or phrase, not exceeding ten words, to print on the reverse side of the “best circle” found in their tins of salt. Postcards, restricted to one from each person, must reach the Secretary, Cerebos Salt Works, Newcastle-on-Tyne, not later than April 9, and the result will be published in the rusty Graphic of April 23 and 30.

The Chemical Syndicate, Limited, has been formed, with a nominal capital of £5,000, for the purpose of acquiring a new process for manufacturing cyanide of potassium.

Messrs. Henry Marks and Sons, Ltd., sponge merchants, Houndsditch, have secured a new block of buildings adjoining their old premises, in order to cope with the demands of their increasing business.

E. Merck, of Darmstadt, and 4, Callum Street, London E.C., is now supplying crystalline emetine hydrochloride for the quick and convenient preparation of ippecacuanha wine (cf. Paul and Cowesley’s paper on “The Chemistry of Ippecacuanha,” ante, p. 693.)

Messrs. Wylays, Limited, Coventry, have forwarded a copy of their new priced catalogue of medical and pharmaceutical specialties. It now occupies 160 pages.

Messrs. Burroughs, Wellcome and Co. in their announcement referring to the death of the late Mr. S. M. Burroughs, state that the business of the firm will be continued as heretofore, and will be under the personal direction of Mr. H. J. Wellcome without any change in the firm’s name. They have retained Mr. W. E. Clay, Sudlow, general manager; Mr. A. Earl, F.C.S., manager of the works; Mr. W. H. Kirby, chief accountant and assistant general manager; Mr. W. Lloyd Williams, F.C.S., assistant manager of the works; and the other members of the general staff. Mr. Sudlow and Mr. Kirby are, as herefore, authorised by power of attorney to sign for the firm.
New Companies Registered.

Mear and Green, Limited.—Registered by A. Cox and Son, 10, St. Swithin's Lane, E.C, with a capital of £100,000 in £10 shares. Object, to acquire the business of manufacturers of and dealers in borax and borax acid, as hitherto carried on at Kidsgrove, and Tunstall, both in the county of Staffordshire, and at Connah's Quay, in the county of Flint, under the style of Mear and Green. With a view to the above, to adopt and carry into effect an agreement expressed to be made between S. Mear T. H. Green of the one part and this company of the other part, and to carry on business as refiners, distillers, and wholesale and retail manufacturers of borax and borax acid, and as manufacturing chemists in all its branches. The first directors—to be not less than three nor more than seven—are S. Mear, T. H. Green, A. Mear, and T. S. Green. Qualification, £500. Remuneration, £1 11s. 6d. each for each board attendance; chairman, £150 per annum.

Ellison and Mitchell, Limited.—Registered by J. Freeman, Dyson and Co., 26, Queen Street, Huddersfield, Yorkshire, with a capital of 18,000 in £10 shares. Object, to acquire the business of chemical manufacturers, as hitherto carried on at Kilnthurst, Yorkshire, by the firm of Ellison and Mitchell, and to develop and extend the same, and, with a view to such acquisition, to enter into an agreement with H. Ellison and others. The first directors—to be not less than three nor more than five—are H. Ellison, H. Ellison, jun., and G. W. Mitchell. Qualification, 10 shares. Remuneration to be fixed by the company. Registered office: The Don Chemical Works, Kilnthurst, near Rotherham, Yorkshire.

Diary of the Week.

[Notices for insertion under this heading should reach the Editor on or before Wednesday.]

Monday, March 25.

Imperial Institute.
House Dinner at 6.45 p.m. “Climbing and Exploration in the Karakoram-Himalaya” (Illustrated), by W. M. Conway, at 8.30 p.m.

Tuesday, March 26.

Royal Institution of Great Britain, at 3 p.m. “The Internal Framework of Plants and Animals” (Eleventh Lecture), by Professor Charles Stewart Institution of Civil Engineers, at 8 p.m. Ordinary Meeting.

Royal Photographic Society, at 8 p.m. “The Evolution of Photographic Objectives.”

Wednesday, March 27.

Imperial Institute.
Concert Dinner at 6.30 p.m. Ladies’ Concert at 8.30 p.m.

Chemical Society.
Anniversary Meeting, at 3 p.m. Annual Dinner at the Hotel Metropole, at 7 p.m.

University College (London) Chemical and Physics Society at 6 p.m. Ordinary Meeting.

Thursday, March 28.

Royal Institution of Great Britain, at 3 p.m. “Animism,” by Dr. E. B. Tylor.

Society of Arts, at 4.30 p.m. “Chemical and the States of the Hindu Kush,” by Captain F. E. Younghusband.

School of Pharmacy Students’ Association, at 7 p.m. “Dispensing Notes,” by various Members.

Friday, March 29.

Royal Institution of Great Britain, at 9 p.m. “The Structure of the Sugars and their Artifices Production,” by Professor H. B. Armstrong.

Saturday, March 30.

Royal Institution of Great Britain, at 3 p.m. “Waves and Vibrations” (Fifth Lecture), by Loni Rayleigh.

Geologists’ Association (London), at 3 p.m. Excursion to Hampstead.

Exchange.

[Notices of books, apparatus, etc., for exchange, exceeding thirty words, including name and address are inserted free, but must not partake of the nature of ordinary advertisements.]

Offered.

Pinder’s Rotary Pill-Coating Machine to take 1 lb. pill; also a 10-gallon copper still, with head and column. Send best cash offers to Dodd, Pharmacists, Ripon.

Notices to Correspondents.

“* * * Communications should reach the Editorial Department, 17, Bloomsbury Square, W.C, not later than the first post on Wednesday, if publication be desired in the next issue of the Journal; though prompt publication cannot always be guaranteed.

Matter intended for publication must be written in ink, on one side of the paper only, and be authenticated by the name and address of the writer; not necessarily for publication, but as a guarantee of good faith.

No notice can be taken of anonymous communications, and contributors are requested, as far as possible, to append their proper signatures rather than pseudonyms, a greater value being thus given to any opinions expressed.

Late Advertisements.

Assistants Wanted.

A QUALIFIED ASSISTANT required in a first-class house where several are kept. Must be a good conterman, accustomed to a high class trade. Apply, Y. Y. Z., care of Horner & Sons, Mitre Square, Aldgate, E.C.

Business for Disposal.

CHEMIST, DRUGGIST, extensively furnished. A 1 position.

Main thoroughfare, N.W. Returns £600 yearly, rapidly increasing being £400, or near offer, including about £350 stock. Good house. Rent £70, worth £100. Lease 14 years. Haines & Co., 16, Red Lion Sq., Holborn.

MARKET REPORT.

Chemicals and Drugs.

THE CHEMICAL MARKET.

THURSDAY, MARCH 28, 1895.

The chemical market has been very quiet since our last, and quotations have undergone but little change, remaining as last week with one or two exceptions. Citric acid is firmly held, but quotations are unchanged, whilst tartaric acid has been little inquired after. Oxalic acid is steady, whilst of the ammonium compounds sulphate remains a very dull market, and another decided fall has occurred during the week. Carbonate of ammonia and sal ammoniacs are unchanged. Borax remains a weak market, but holds itself steady, and at still lower already rates. Copper sulphate has been quiet, the cheaper brands having somewhat fallen. Cream of tartar remains very steady and in demand; supply: quite ideas are unchanged. Bicarbonate are unchanged, whilst quicksilver has shown a continued weakness in its demand, although importer's prices are maintained. Pottash and soda compounds are quiet at unchanged rates.

ACID BORICUS.—Crystals are worth 30s. 6d. powdered, 51s. Acid Citric.—Is firmly held, at unchanged rates. It is still quoted at 1s. 13½d. to 1s. 3½d., according to quality. Acid Oxalic.—No change has occurred, and a fair amount of business has been done at the quoted rate of 8s. 6d. to 9s. 6d. Acid Tartaric.—The market has been quiet, and quotations remain unchanged. English makers quote at 10s. 4d. to 11s. 4d. Foreign, 10s. 4d. to 13s. 4d. at 10½d.

AMMONIA SALT.—Sulphate: A very quiet market since our last, and prices have fallen still further. The closing quotation is 10s. 15½d. to 11s. 4½d. for grey 24 per cent. Carbonate: There has been a fair demand at last week's rates, quotations being 3½d. to 3½d. for 1s. ammoniac. Uralised, first quality being quoted at 3½d., with seconds at 3½d.

ASHER.—Rather quiet at unchanged rates. Americans is quoted at 1s. 13½d., for powdered white.

ARSENIC.—The supplies continue somewhat poor, and the price is fairly maintained at 1s. 5d. for 40-gram packages.

BORAX.—In very dull demand. The Syndicate prices are maintained, but it is stated that business is not to be had, whilst in second hands it is still rather high, and is quoted at 6s. 6d. per cwt. BORAX SULPHATE.—The market is dull. The cheaper brands are held steady, but the best quality is fairly well returned at 2s. 11½d.

CARBON OF TARTAR.—Last week's quotations are maintained, but only a small amount of business has been done at the quoted rates. Finest French white crystals are worth 6s. 6d., whilst German powder is quoted at 5s. 10d. to 6s. 5d.

MERCURIAL.—None supplied. Quotations up to 2s. 5s. have been quoted at:—1s. 2½d.; 2s. 9½d.; 6s. 8d. per cwt. less. POTASH COMPOUNDS.—The market is rather firm. Prussiate quiet at 35s. Chloride somewhat firmer. Sales in Liverpool have been made at 45s., whilst in London it closes steady at 45s. 6d. bicarbonate unchanged at 45s. 4½d. Quickclay.—Very. Importers' quotations are firm at 10s. 10d., but in second hands it is still high, and is quoted at 10s. 6d.

SALT PETER.—Bengal is quoted on the spot at 17s. 6d. for 3¾cwt. to 3 cwt., whilst for arrival, March-April, there are sellers at 17s. 9d. to 18s. 6d. Asphalt is worth 22s. 6d. to 25s. per cwt. Soda.—Soda Sulfate, 70 per cent. is unchanged at 24s., whilst 80 per cent. is quoted at 27s. Crystals are unchanged at 38s. 6d. to 40s. 6d. (London). Hypophosphite: steady at 26s. 5s. in 1 cwt. bags (Liv. 770). The Drug Market.

THURSDAY, MARCH 28, 1895.

There have been few changes in the Drug Market since the auctions last week, and only small sales have been made. Caesarea, nominally unchanged, but there is some spot delivery. Crude camphor, both spot and arrival, has been further advanced, and closes very firm, whilst refined camphor is unchanged, although an active demand is shown. Benzoin is still very firmly held at the advanced noted last week, and will probably see still higher prices. In phecaxian, some sales, both of Rio and Orthocresol are both sold at steady rates. Japol is easy, whilst colchicun is fairly held. Menthol is very steady at an advance. Morphine and codeine have both been lowered. Of the essential oils, e. g. oil, is as steady as ever. The prices of Benzoin, codeine, and menthol remain at the same figures as last week, and are not considered advanced, and are fairly held at the quoted rate.

CAFFEINE.—Continues very firm, as there are no quotations for spot delivery. Normally, quotations remain as last reported, whilst of the smaller quantities, 10s. 5s. to 10s. 6s., and smaller, wholesale quantities at 10s. 6d.

CAMPBELL (crude).—The market continues in a very uncertain state, and prices have been further advanced during the week. On the spot, Japanese campher is scarce at 12s. 5d. to 12s. 6d., whilst China is quoted at 12s. 6d. The quotations for arrival: Japan, March-April shipment, 12s. 6d. c.i.f., with Chinese, 10s. 5s. to 11s. 6d. c.i.f.

CERRUPOS (refined).—The expected advance in refined camphor has not materialised. It is steady at 12s. 0d. to 12s. 5d. and smaller. The prices of English refined and English refined still quote belles and Flowers at 11s. 4d. for 10 cwt. lots, with prices at proportional rates.

CHILLIES remain very quiet, without improvement. At the last sale Zanibar was bought in at 20s. 5d. to 22s., with Sierra Leone at 22s.

CLOVERS.—At the sales only a few bales of Zanibar is 1d., quality 5½c. Private sales of fair to good have been made at 20s. 5d. to 21s.

COCAINE.—Very firm at last week's quotations of 20s. 3d. for 100 cwt. lots, with smaller wholesale quantities still at 20s. 3½d. It is probable that this week's quotations will still be further advanced, as it is very firmly held at these rates.

COCONUT.—Quiet but steady. A few sales have been made at 12s. 5d. to 13s. 3½d. for 10 cwt. lots.

COQIUNTA.—Steady. Private sales of good Turkey apple have been made at the rate of 1s. 6d., and holders now ask 1s. 6d.

COPIA.—Marseilles is steady, at 1s. 7d. Peru balsam has been sold privately at 1s. 6d.

SPECCHIAMA.—Since the sales both Rio and Orthocresol have been in fair demand at steady prices, the previous quotations being full maintained.

JAPAN.—Remains quiet. Some business has been done privately in Fair China, at 1s. 6d.

BENGAL.—Cochin China is fairly firmly held. On the spot quotations nominally remain unchanged at 1s. 6d., but it cannot be brought under 10s. Forward rates are 10s. 5d. to 11s. 4d., c.i.f., and there is a very small offer at 10s. 5d.

MORPHINE.—Easy, as the reduced quotation of 4s. 7d. to 4s. 9d. nothing to quote for during the week. OILS (mouths).—Still trading at 6d. to 7d. c.i.f. terra. Oils: Very steady at an advanced of 6d. to 9d. It is today firm in 6d. to 7d. Oil is being sold to dealers at 6d. to 7½d. per cwt. OILS (fixed) a. J. O. Oils:—Cod liver oil: The market is very weak, and it is impossible to give a reliable price for new oil, which is quoted at 3½d. to 5½d. different rates. Linseed: A week marker, and quotations have been reduced. It is now returned at 10s. 12d. to 11s. 0d. Cod liver oil and sardine oil is somewhere around 11s. 6d. to 12s. Peppermint, H. & Co. Shear oil is steady at 10s. 0d. Eugenol. There are no sales to report, and the demand has altogether died out.

OILS (fixed) a. J. Oils:—Cod liver oil: The market is very weak, and it is impossible to give a reliable price for new oil, which is quoted at 3½d. to 5½d. different rates. Linseed: A week marker, and quotations have been reduced. It is now returned at 10s. 12d. to 11s. 0d. Cod liver oil and sardine oil is somewhere around 11s. 6d. to 12s. Peppermint, H. & Co. Shear oil is steady at 10s. 0d. Eugenol. There are no sales to report, and the demand has altogether died out.

PILOCARPINE.—Quotations for Hydrochloride and nitrate remain unchanged at 7½d. to 8½d. per cwt. per gramme.

Senna—Quiet. Fair root offers at 1s. 5d.

SOY.—Dull of sale. Fair Chinese offers at 10d.

QUINEE.—A small quantity have been done in the best German makes on the basis of 11½d. to 11½d.

PERRY (SALAM).—But little offered. It is held for 5s.

SHELLAC.—There has been no improvement in the price, and small sales only have been made. For arrival there are buyers of T. N. orange at 10s. 6d., c.i.f.
Modern Pharmaceutical Industries.

AERATED WATERS.

JEWSBURY AND BROWN'S NEW MANUFACTORY.

The gradual and continuous growth of the mineral water business of Messrs. Jewsbury and Brown has recently found expression in the erection of a new manufactory, which, we should judge, is unsurpassed for the purpose for which it is required. Towards the beginning of the century this firm began the manufacture of mineral waters at the premises, which they still occupy as a pharmacy, 113, Market St., Manchester. In consequence of the appreciation with which their goods were received, they had to remove to premises which were devoted solely to this branch of their business. Rather more than a quarter of a century ago they made another removal, from the same cause, to the establishment which they have just closed, at the corner of Grosvenor Street and Downing Street. As the taste for aerated beverages in recent years has become more popular, their trade has increased by leaps and bounds, and they have been compelled to erect the manufactory, of which, we think, a description will not be unacceptable to our readers.

On an admirable site at the north end of Ardwick Green, which is probably the largest open space in Manchester, a handsome building has been erected from the designs of Messrs. Horsfield and Son. It is in the Tudor style, and is built of red Rushton brick relieved with massive sandstone dressings. The main building has a frontage of one hundred feet and a depth two hundred and twelve feet to Charlton Place in the rear. At the south-west angle a fine tower rises to a height of ninety feet; this overlooks the Green, and, being situated on a natural elevation, commands very extensive views. In the base of the tower is the main entrance fitted with wrought iron gates of an appropriate and artistic design. Some idea of the size of the building may be obtained from the statements that it was over a year and a half in construction, and that it has a floor area of ten acres. It is designed in the form of an oblong of which the end in Charlton Place is closed by large gates giving entrance to a spacious yard in the centre of building. The yard is covered in by a glass roof supported on light iron girders, and is crossed by a covered-in gangway connecting the upper storeys of the two wings. In furnishing the premises everything has been provided and made to render them as nearly perfect as possible for the requirements of the firm. The west wing is set apart for the reception, cleansing, repairing and storage of "empties," and the east wing for the filling, storage, and dispatching of the bottled waters. On the ground floor of the "empties" wing the empty bottles and syphons are received and unpacked. As
Aerating Machines.

A large aerating machines are placed along one side of the spacious quadrangle, or so-called "room," and them the aerated waters are distributed to the various bottling machines. These latter are of various designs, the most interesting being the automatic ones which only require to be fed with bottles and corks, filled bottles being passed on to be wired and corked. The most ingenious contrivance is an automatic syphon filling machine, this is protected by a sent of this firm's. Only the finest grain tin is used for the pipes which convey the various waters. Block is not considered by Messrs. Jewsbury and Brown as sufficiently pure. The piping in the machine m alone must represent a considerable sum of money, as it forms a complete network overhead. At the top of the yard and contiguous to the boiler house is the gas generating room. It is here, if anywhere, that the test of cleanliness can be applied to a mineral water manufactory. In this instance there is not the slightest sign of failure. Perfect order and cleanliness reign. Here, again, is another piece of apparatus owned by the firm. The acid is regulated in its work by a contrivance which works automatically in conjunction with the gas holder. So slow and well regulated is the passage of the acid into the generators that there is no appreciable rise of temperature, and no sudden evolution of gas to cause undue pressure upon any part of the apparatus. In the syrup and solution rooms the same scrupulous cleanliness is manifested, the floor being thoroughly scrubbed and washed every day. Above this is the sugar store, from which the sugar is passed down "shoots" into the large jacketed pans in the syrup room. The syrup is then conducted by its own gravity into a large number of huge earthenware jars used for storage purposes. The flavoured syrups used for the waters are placed in large slate cisterns, from which they are automatically drawn off by the bottling machines on the ground floor. Here are also found three rows of large slate cisterns containing the various solutions—soda, potash, lithia, etc.—for feeding the aerating machines. The water supplied to Manchester is exceptionally good; but this notwithstanding, it is subjected to the most efficient system of filtration that has been devised. After being filtered by mechanical means it is passed through a battery of gravitation filters each having a capacity of 1,500 gallons; all suspended impurities, infusoria, bacteria, etc., are thus completely removed. From the machine room the full syphons and bottles are removed by an elevator to two different floors in the east, or "full," wing. The syphons are polished, labelled, examined by a responsible man, and packed into dozen cases. The cases are brought from the "empties" wing by way of the covered gangway. The bottles are examined and packed away in bins to be kept in stock at a fixed temperature during a certain time, in order that faulty bottles may be detected before being sent out. Upon the ground floor of the "east" wing is situated the dispatching department. It is elevated to the level of the drays and carts so as

MARKET REPORT.

Chemicals and Drugs.

THE CHEMICAL MARKET.

THURSDAY, APRIL 4, 1895.

[The quotations here given are in all cases the lowest net cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the trade. It is important that this should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.]

In the Chemical Market business has been very quiet since our last, and quotations practically remain unaltered, any changes representing for the most part a depression. Citric acid remains firm at the quoted rates, which are unaltered, whilst there are few inquires for tartaric acid, which is easy at the quoted prices. Of ammonium compounds, sulphate continues a very flat market, and closes at steadier rates than last week. Carbonate of ammonia and sal ammoniac are unchanged. Borax is quiet at unchanged rates, whilst arsenic and salis are firm. There has been a fair amount of business passing in sulphate of copper at unaltered rates. Cream of tartar is plentiful, and closes firm at the last quotations. Mercury is unchanged, whilst quicksilver is a steady firm in second hands. Potash and soda compounds are unchanged, with the exception of prussiate of potash, the quotations for which have been considerably lowered by the manufacturers.

ACID BORIC.—Crystals, 30a.; powdered, 31a.

ACID CITRIC.—Remains a steady market and business has been done at fully last week's rates. It is still quoted at 1s. 1½d. to 1s. 2d. according to quality.

ACID OXALIC.—No movement has occurred in this, and a fair amount of business has been done at the quoted rate of 5s. 4d. net to rest.

ACID TARTRIC.—Little business passing, and although quotations nominally remain unchanged, for the foreign brands of acid fractionally easier prices would be accepted. English makers quote at 10½d. to 11d.; foreign ditto, both power and crystal, 10½d.

AMMONIA COMPOUNDS.—Sulphate: Still presents a very dull market, and since our last quotations are somewhat easier. The closing prices for grey 54 per cent. is £1 10s. 9d. to £1 11s. 5d. Carbonate: Steady at the unchanged rates of 3½d. to 3½d. Sal Ammoniac: Unaltered, first quality being still worth 30s.; with power, 32½d.

AXE.—Steady at unaltered rates, American being quoted at 40s., with pot at 25s.

AURUM.—The supplies are still none too plentiful, and the quotation for powdered white remains steady at 15s.

BLEACHING POWDERS.—The quoted rate is still 5s. 6d., but there are not many inquiries.

BORAX.—Continues to present a weak market. Nominally, the prices are unchanged, 20s. for crystals and 21s. 4d. for powder, but it can be readily obtained from second-hand holders at fully 10 per cent. less.

 COPPER SULPHATE.—Steady. A fair amount of business has been done on the beats of £1 15s. to £1 20s., according to brand.

CREAM OF TARTAR.—A firmer tone prevails in this market, and last week's rates are maintained. Quotations for the finest white French crystals are 65s. 6d., whilst German powder is worth 65s. 6d. to 66s. on the spot.

MERCURY.—Unchanged. Quantities up to 28 lbs. are still quoted at: Colonial, 2s. 9d.; pure precipitate, 3s.; white ditto, 3s. 6d. corrosive sublimate, 2s. 6d.

POTASH COMPOUNDS.—A dull market. Permacite: The makers have reduced their prices from 9½d. to 9d. Chlorate: Fairly steady. Sales in Liverpool have been made on the basis of 43s., whilst the quoted rate in London is 45s. Bioklorinate is unchanged at 4½d. to 4½d.

QUICKSILVER.—Importers still return at £2 10s., and in secondhand it is a tripe firmer at £2 8s. 6d. to £2 9s.

SODA COMPOUNDS.—Common Soda, 70 per cent. is unchanged at £2, with 80 per cent. at £2 1s. (Crystals steady at 35s. bicarbonate, 27s. 5d. (London). Hypophosphite: steady at £2 5s. in 1 cwt. bags (Liverpool).

THE DRUG MARKET.

THURSDAY, APRIL 4, 1895.

The usual fortnightly drug sales passed off very quietly, and the general tone of the market was very dull. Aloea are generally firmly held; no Capo was offered to-day, and holders privately ask advanced prices. Buchu leaves sold fairly well at steady rates for good, bright, short leaves. A very large amount of nephostila was offered, of which a good proportion was sold at fairly steady rates. Bensoin was in fair supply, and some of the best grades fetched fancy prices. Ipecacuanha was in moderate supply, and a fair amount of business was done at fairly steady rates. Eucalyptus oil sold very cheaply when offered without reserve. Balsam is in good supply and steady prices were realised, especially for Macassar wax. The market for crude camphor still remains very uncertain, and spot quotations for the Chinese article have been further advanced, whilst for forward shipment there are no offers. The position of the various alkaloids is practically unchanged.

ACACIA.—A moderate supply only was offered to-day. Two casks fine white picked gum sold without reserve at £3. For Sardin sorts there were no inquiries, and all was bought in. A parcel of nine casks of Alidad gum was bought in at 45s. for fair mixed bright pale and amber.

ALOE.—No Cape was offered to-day. A parcel of 80 kegs of bright softish Soestrand aloes was bought in at 72s., whilst 30 boxes of fair Livvy Carsons were knocked down at 45s., subject to approval. A parcel of 300 gourds of Carsons was held for 72s. dark quality, with good bright Soestrand at 80s. A parcel of 216 bags of Carsons sold well at the rate of 14s. to 15s.

AMBER.—A fair amount was offered to-day, but no sales were effected. Bought in at prices varying from 50s. to 80s.

AMONIAC.—In good supply, but all was bought in at the following rates: Fair almons, slightly blocky, 50s.; mixing blocky and almons, 55s. to 65s.; other qualities, 30s. to 50s.

ANISEED.—Chinese star anise was bought in at 20s. Anisetto Simena.—Bought in at 35d. for fair bright seed.

AROMAT. WATERS.—At to-day's sales a parcel of French aromatic waters was again offered, consisting of rose, orange flower, and mallow. Water. All were again bought in at the rate of 5d. per lb.

ASPARAGUS.—A very large quantity, amounting to 661 pack ages were offered to-day, and met with a fair demand, at fairly steady rates. Mixed greyish and pinky black sold at 72s. 6d. to 80s. Other qualities 50s. to 65s.

BEETROOT — The market was quiet for beetroot to-day, four cases of ordinary seconds sold to-day at £6 10s., whilst fair
all fibrin does not develop a disagreeable odour, like most of the hemoglobin preparations. The "tabloidis" are not costly, being supplied in bottles of 100 at 1s. per bottle. The dose suggested is one or two thrice daily. Thymus gland "Tabloidis" consist chiefly of nuclei and nucleo-albumin. The general idea is that these substances increase the number of leucocytes in the blood and are, therefore, found to be of value in all lymphatic conditions. They have been especially useful in some forms of pernicious anaemia and leucocytosis. Dried Sulphate of Iron "Tabloidis" disintegrate readily when swallowed with a draught of water and afford a very pleasant and effective means for administering the salt of iron. "Zymine Tabloidis" and Compound "Zymine Tabloidis" are keratin-coated in accordance with the suggestion 16, well-known professor of therapeutics, it being the assumption that "Zymine," or the ferments of the pancreas, when taken by the mouth are digested and destroyed by the gastric secretion. These "tabloidis" are said to pass intact through the pylorus, and are quickly dissolved and rendered active in the alkaline secretion of the duodenum and intestinal canal. Ferrumxyonate of Zinc "Tabloidis" are made of such strength that one tabloid is dissolved in 1 oz. of water made up to the proper strength of solution for injection, or for gargling the throat in putrid conditions. Such a solution is said to be most effective in gleet. The salt is powerfully astringent, as well as antiseptic and germicidal, and for persons travelling abroad who are unable to carry large bottles of solutions they are said to be found most convenient and effective. The "tabloidis" may be dissolved in the barrel of an ordinary glass syringe full of water, as required. Medical Bag & Co., also announce that they have successfully produced a dried anti-diphtheritic serum of full potency, possessing the following advantages:—A full guarantee as to its keeping properties; it is not necessary to keep the bottles and is most convenient for use; and it dissolves readily in cold water, which, before being used, should be freshly boiled and sterilised. The contents of each tube equals 10 C.c. of normal anti-diphtheritic serum, and may be dissolved (for use) in 5 C.c. of water, sterilised by boiling. This will be found sufficient for one dose. The serum is prepared under the direct personal supervision of a well-known London bacteriologist, in strict accordance with the latest developments, ensuring a most powerful immunising serum, so that both for potency and freedom from septic influence the new product is beyond question. The Anti-Diphtheritic Serum Excisatum is supplied in tubes containing 1 gramme at 1s. each.

Company Business.

WILLIAM EPELEY AND CO., LIMITED.—Registered Manufacturers of Wollaston, London, E.C., with a capital of £10,000 in 25 shares. Object, to enter into an agreement with W. Epeley for the acquisition of the business of manufacturing chemist as hitherto carried on, and to continue the style of William Epeley and Co., at Chesterton, Staffordshire, as well as to take over and extend the same. The first directors—to be not less than three nor more than five—are H. Crutchley, J. Birk, and F. Creed. Qualifications, 100 shares. Remuneration to be fixed by the company.—Financial News.

Late Advertisements.

Assistants Wanted.

THOMAS G. STONHAM & SON, Maidstone, require a qualified assistant. Age about 24. Must have had experience in good-class Dispensing and Retail. Apply by letter, stating full particulars, age, height, and salary expected. Enclose photo, to be returned.

A T ONCE—Junior Assistant, steady and trustworthy, with good references, for a Preparing, Dispensing, and general Retail business. Address, with full particulars as to age, height, salary required, references, and enclosing photo, to E. G. Bayley, Chemist, Seaside Rd., Eastbourne.

MARKET REPORT.

Chemicals and Drugs.

THE CHEMICAL MARKET.

Wednesday, April 10, 1895.

[The quotations here given are in all cases the lowest net cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the pharmacist. It is important that this should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.]

Since our last, business in the Chemical Market has been rather more brisk, and there is a better all-round tendency, although prices have not altered to any considerable extent. Citric acid is quiet at unsaluted rates, whilst tartaric acid has been in better demand throughout the week, and the quotations for foreign brands show a slight advance. Of ammonium compounds, sulphate remains very dull, and quotations have fallen fully 5s. per ton since our last. Carbonate of ammonium and sal ammoniac are unchanged. Borax is still exceedingly quiet, and the same applies to sulphate of copper, in which the demand has recently slackened considerably. Phosphates are unsaluted, and arsenic is firm at steady rates. Cream of tartar is very firm, both French and German makes being in good demand, with a tendency to see higher prices. Importers have advanced the price of quicksilver, the quotations of second-hand holders being correspondingly raised; but mercurials remain unchanged at present. Polish and soda compounds are unchanged and quiet.

ACID CITRIC.—Has been a quiet market, and quotations are unchanged. The prices returned are still 1s. 15d. to 2s. 2d., according to quality.

ACID TARTRIC.—A very steady market, and quotations for the foreign brands are somewhat advanced, and will probably go higher. English makers' prices are unchanged, quotations being still 10s. 9d. to 11d.; foreign brands are returned at 10s. 9d.

AMMONIA COMPOUNDS.—Sulphate: Still remains a dull market with nothing doing at all, and prices have fallen from 5s. to 7s. 6d. further during the week. Grey 24 per cent. is now returned at £10 7s. 6d. Carbonate: Quotations are still maintained at 3½d. to 3½d. Sal ammoniac: Unchanged at 37s. to 38s., according to quality. All ammonium compounds are easy, and a fall is not improbable.

ASHERS.—Unaltered; American being steady at 40s., with pesos at 23s.

ARSENIC.—Is still scarce, and quotations are firmly maintained at 15s. for powdered white.

BLANC FIXE.—Still returned at 5s. to 6s. 3d., but there is not much business doing.

BORAX.—The Convention prices are maintained at the old rates, but second-hand holders offer at from 6d. to Is. per cwt. less than the makers, the quotations of the latter being, crystals, 20s.; powdered, 2½s.

COPPER BULLETS.—Quiet. The market is dull, quotations remaining, nominally, £1 15s. to £1 15s. 10d., according to brand, but lower prices may be expected shortly.

CREAM OF TARTR.—Has been in steady demand throughout the week, and quotations will probably be advanced to-day. The finest French white crystals are worth 6s. 6d. to 6s. 8d., whilst German powder is quoted at 6s. 6d. to 6s. 8d. on the spot.

MERCURIALS.—At present unchanged. Quantities up to 28 lbs. are still worth: Calomel, 2s. 9d.; nitrate of potash, 3s.; white arsenic, 5s.; corrosive sublimate, 2s. 6d.

FUSASE COMPOUNDS.—Generally quiet. Fusicides unchanged at last week's rate of 6d. Chlorate dull. Sales have been made in London on the basis of 4½d., but it is freely offered at that rate. Bichromate unchanged at 4½d. to 4½d.

QUICKSILVER.—Importers have advanced their prices to £11 5s. Second-hand holders, are correspondingly higher, and range from £11 5s. to £11 14s.

SODA COMPOUNDS.—Caucasic Soda: Dull of rate at £2 7s. 6d. per cent., with 60 per cent. quoted at £7. Crystals steady at 35s. Bicarbonate, £2 7s. 6d. (London). Hyposulphite: £2 5s. in 1 cwt. kegs (Liverpool).

THE DRUG MARKET.

Wednesday, April 10, 1895.

Owing to the proximity to Easter, there has been but little business doing in the Drug Market since the sales last week. Things continue very scarce and firmly held, and only small quantities can be had at any price. Crude camphor remains very firm; at present, however, there are few offers either spot or for delivery, and quotations are not very reliable. Refined camphor is still unchanged, although, of course, the present price of the crude article fully warrants an advance. Cocaine remains unchanged, but is firmly held at the quoted rate. A fair amount of business has been done privately in spicacanba, both Rho and Carthamnus root since the sales at fully steady rates Jalap is very easy, and freely offered at the quoted rate. Business in the opium market is dull, and this, of course, affects the various alkaloids, which are quiet at the previous rates. Menthol and peppermint oils are steady, and of the other essential oils, star anise is held at last week's rates, and will see higher prices, whilst cassia is very steady.

CAFFEINE.—None to be had for prompt delivery. In second hands, 22s. is now asked and then only small quantities are obtainable.

CAMPHOR (crude).—Remains very firm and no sales of Japanese are reported, whilst Chinese is quoted at 11s. 6d. to 12os. For shipment Japan is quoted at 13½d. c.i.f. April to May, whilst there are no offers of Chinese.

CAMPBELL (refined).—Although the present position of the crude outside fully warrants an advance, no move has yet been made, the English and German refiners waiting for one another to take the initiative.

CHILLING.—At the last sales Zanzibar sold at steady rates, and very dull business at 25s.; good bright at 29s.; Sierra Leone was bought in at 26s.

COVEZ.—Zanzibar was easy at the sales this week, when dark damp sold at 2½d. Picked Penang was brought in at 5½d.

COCAINE.—Last week's quotations of 20s. 5½d. per 100 oz. lots are unchanged, and it is fairly held at this rate.

COCHINHINA.—Moderate amount of business has been done privately in both black and silver at the rates of ls. 3d. to 1s. 4d.

COLOGNET.—Is easy at the last quotation of 11s. 6d. to 12s., and in second hands it is still offered at 11s. 6d.

COLCYNTH.—Is fairly held. Private sales of good pale Cypris have been made at 1s. 2½d., and there is a probability of an advance.

COPIRED.—Privately Murrumbat has been selling at 1s. 7d. with Parin and Bukin at 1s. 5d.

PECCANNA.—Since the last sales a fair amount of Carthamnus root has been sold at 3s. 7d. for slightly damaged root. Rio has been in fair demand privately at fairly steady rates.

JALAP.—Very dull of sale, and although for fair Vera Cruz 1s.
SUPPLEMENT TO THE PHARMACEUTICAL JOURNAL AND TRANSACTIONS. APRIL 13, 1895.

is asked, less would be in many cases be accepted; this is for old root. The new root is easy at reduced rates.

MENTHOL.—At the spot holders offer at from 15a. 6d. to 16a. Forward rates are 14a. to 14a. 6d., c.i.f. terms, April to May shipment.

CINNAMON.—Unchanged at 4a. 7d. to 4a. 9d. with small whole-clove quantities at 4s. 10d.

OILS (ESSENTIAL).—Star Anise: 1s. very firm. During the week sales have been made at the rate of 6s. 3d. on the spot, and in some instances as much as 6s. 6d. is now asked. For arrival it is quoted at 6s. 5d. to 6s. 8d., c.i.f. terms. Cassia is quoted at 4s. 7d., c.i.f. terms, while on the spot, 5s. 6d. to 5s. is asked for 75 to 25 per cent oil. Citronella is in steady demand at 1s. 1d. Lemon-juice: Dull of sale at 1jd. to 1jd 3d. Peppermint, H. G. Hoffmann brand is unchanged at 8s. 9d. to 10s. Japanese oil containing 40 per cent menthol is quoted at 8s. 5d. to 8s. 6d. with 2s. offered at 7s.

OILS (FIXED) and SPIRITES.—Olive oil is very steady, and from all accounts prices will be considerably advanced. During the week sales have been made at 15s., but 15s. is now asked. At 15s. at firm rates. Quoted at £19 15s. to £21 17s. 6d. on the spot. Guavi very firm, and prices have been advanced fully 1s. 6d. since our last quotations. Refined oil is now worth £17 15s. to £18 15s., according to brand. Cocoa-nut.—Oxen is very steady at £25 3s. Cocoa—25 10s. Mauritius: 25s. 5s. Ope is steadier, refined oil being worth £22 10s. Turpentine is very dull of sale, American spirit being worth 22s. 6d. on the spot. Holders have advanced their prices still further, as American is now quoted at 6d. to 6;5d., with Russian at 3s. 4d.

OPUS.—The market is dull, and a fall in the price is not improbable. Nominal quotations are:—Turkey, soft, shipping descriptions 12s. to 12a. 3d., best drogists, 10a. to 10s. 6d.; seconds, ditto, 8s. 6d. to 9s. 6d.; Persia 11a. to 11s. 9d.

PERU (Balsalm).—Is somewhat scarce, and is very firmly held at a considerable advance, 10s. now being asked.

QUININE.—The market is firm, but little business has been done. Some small sales of the best German makes have been made on the basis of 11l. 4d. to 11l. 7d.

SHELLAC.—At the sales on Tuesday, the demand was very poor, and little business resulted. Steady prices were realised for the amount which changed hands. For delivery, no sales have occurred.

Soy.—Dull of sale, and fre.ely offered at 10d.

Last Week's Drug Sales.

The following information is taken from Messrs. G. N. Scurratt and Co.'s Reports:

SINGAPORE PRODUCE.

CUBEB was again dull of sale, 114 bags, 7 cases, fair, to good quality offered and all bought in, also 15 bags moidony stalks, and 4 bags sittings.

DRAGON'S BLOOD—The demand has quite fallen off, 45 cases offered, comprising a good assortment of quality, but nothing sold.

CAMBOGE was also dull, and but little enquiry; 52 cases offered were all bought in.

GUM BENJAMIN SIAM, 38 cases offered, of which 1 case fine small to bold pale free almonds sold at 22s. 8d. and 3 cases pale bean and pea size, part blocky, at 21s. Samutro continues slow of sale. Of 197 cases offered only 24 cases sold; good seconds, rather brown at ends, 29s. 6d. ditto, a little baryk, 27s.; ditto, rather brown sides and ends, 26 10s.; middling, rather brown sides and ends (without reserve) £2 5s. 6d. to £5 7s. 6d. Palembang, 25 cases fair seconds, and 25 cases brown thirds, were bought in.

IGNATIUS' BEANS.—Five bags fair quality bought in at 3s.

Nutmeg Paste.—Eight cases offered and bought in at 3jd.

Oil Caperputa.—Thirty cases offered, and all bought in.

ACONITE, JAPAN.—Fifteen bags offered were bought in at 25s.

ANISEED STAR, CHINA.—Ten cases good quality were bought in at 77s. 6d., and 19 cases ordinary dark and broken at 30s.

ANTIMONY, JAPAN CRUDE.—Seventy-five cases offered, and all bought in at £21 15s.

Camphor has been in speculative demand, and business to some extent has been done on the spot, chiefly in China at 110s. to 115s., Japan, 117s. 6d. to 120s. To arrive sales have been made of China, March to May shipment, at 110s., and Japan 117s. 6d., c.i.f. terms. Thirty-five cases China in auction, 17 cases solid, old import, at 115s. reweighted.

CANTHARIDINE.—Five cases small to bold, part worn, bought in at 1s.

GALLS, CHINA.—Firmer market, with small sales privately at 53s. 6d. to 55s. more money now asked. No sales for arrivals to this market, but business is had for the done at the Continent at higher prices.

MUR. TONQUIN.—Dull market, 16 tuns offered and bought in.

OILS.—Aniseed: Quiet but firm at 6s. 3d. per lb. Cassia: Considerable sales at advancing prices from 4s. 6d. to 5s. Peppermint, Japan: Fifteen cases found and 16 cases menthol offered, and all bought in.

RHUBARB continues uninterruptedly dull, and of 12 cases offered only 20 cases sold. Shanze Rod: Of 49 cases offered 20 sold. Rod with some disintegration held for fair to good, trim fracture, about 1s. 2d.; reddish, 1s. 3d.; grey and dark, 1s. 1d. Flat ditto, ditto, with some rough pieces, about 1s. 2d.; red, 1s. 2d.; grey and dark, 1s. Round and Flat: One case pinky, 1s. 2d.; one dark, 1s. 1d. Cassia Root: Thirty-seven cases offered, and High Dried 54 cases; none sold.

Soy, China.—Twenty-five cases fair bought in at 1s. Japan, 18 cases sold without reserve at 5d. and 6d. per gallon.

VERMILION.—Five cases offered, and bought in at 2s. 6d. Wax.—(Vegetable) Japan: One hundred cases good squares bought in at 27s. 6d., best bid 28s.

BOMBAY PRODUCE.

ALOES SCOTHINK, BOMBAY.—Quite neglected, 61 bars offered, were all bought in; 23 cases very low black Moms, sandy and stoney, were withdrawn; about 10 bars Zansihar Hapatic in skins only, coarse and drowsy to good hard, were all bought in.

CARDAMOMS.—Seven cases fair Mangalore offered and bought in.

COLOGO ROOT.—One hundred and sixty-four bars offered, all bought in.

CUTTLE FISH.—35 lbs. small to bold, damp and discoloured were again offered and bought in. No bid made.

GUAVA.—Again quiet, and nothing doing; the ordinary stuff likely to fair grades and bought in.

GUM AMMONIACUM.—Thirty-nine cases and 1 bag offered, of which 6 cases, small to boldish pale free deep, part slightly run and rather seedy, sold at 31s., and 1 bag of dry blocky sittings at 35s.

GUM ASAFETIDA.—Recent heavy arrivals have seriously depressed the market and, as was to be expected, prices have given way considerably; of 353 cases and 56 boxes offered 235 cases and 33 boxes sold. The sales opened with a dull tone, the biding being very sluggish, and good to fine gum sold at a decline of 30s. to 40s. per cwt. and medium grades 10s. to 20s., while low quality went at full rates. Later, as more disposition showed to realise, prices further gave way, and fair to good gum was sold at a decline of 30s. to 40s. per cwt. on sales rates. Fine bold pale dry Alomony droop sold at 50s. to 110s.; ditto, slightly run, 100s. The three main classes of size at these prices. Fine size sale free drop, 40s.; good softish to clean dry grey and pinky block, 70s. to 80s.; softish slight sandy, 70s. to 75s.; later, 60s.; softish to very soft and rather sandy, 60s. to 65s.; little red, bright stone yellow, 60s. to 62s.; good fair grey and pinky block, dry and part hard, 60s. to 65s.; ditto softish, and rather sandy, 60s. to 62s.; later, red very fair grey and pinky, mostly block, some loose, fair, sold at 62s. to 60s.; fair to good grey and red bick, slightly bright and stone, 55s. to 45s.; good middle grey and pinky half loose, quarter block, part hard, and some little foul with matting, 27s. to 41s.; good middling 40
the pattern adopted in which a longer insulating surface is interposed between the conductors and the bearer. The Committee is also of opinion that it is desirable that means should be provided by which the conduits can be inspected throughout their length, so far as is necessary to detect incrustations on the insulators. The Committee did not consider it within their province to investigate the causes of the presence of coal-gas within the electric lighting conduits, but obviously that was the primary source of danger.

Parliamentary News.

In the House of Commons on Tuesday last, Mr. Powell-Williams asked the Home Secretary whether his attention had been called to a recent case of death caused by the explosion of a gas cylinder at Fenchurch Street Station, and to the recommendation of the coroner's jury that gas cylinders should be subjected to a Government test and should be stamped, showing that they were capable of resisting the pressure of the gases which they contain; and whether he would take steps, in the interests of public safety and of a large and growing industry, to carry out the recommendation of the jury.

The Home Secretary said he had received a report from an expert on the subject. He intended to invite a further expert inquiry. It was reported to him as most probable that the explosion was not due to an imperfectly welded cylinder, but was caused by the ignition of an explosive mixture which no cylinder would stand, however perfectly it had been tested. But he would request those who were to be consulted on the matter to inquire how far the Government test would be a safeguard, and he would carefully consider the suggestion thrown out by the hon. member.

Partnerships Dissolved.

[From the London Gazette.]

George Stephen Woolley, Hermann Woolley, Charles Andrew Johnstone, and Edward James Woolley, carrying on business as manufacturing and pharmaceutical chemists in Manchester, under the style of James Woolley, Sons, and Co. The business will be carried on by James Woolley, Sons, and Co., Limited, whom all debts due and owing by the late firm will be received and paid.

Henry Kellett and Walter Kellett, carrying on business as chemists and druggists at 87 and 99, Chapel Street, Salford, under the style of Henry Kellett, who will continue the business in his own name.

William Chapman and James Harrison, physicians and surgeons, of Garstang, Lancashire.

Henry Spicer, Edward Spicer, and Augustus Spicer, carrying on business as photographic material manufacturers at Surrey Row, Blackfriars, under the style of the Blackfriars Photographic and Sensitizing Company.

Marriage.

Company Business.

**NEWMAN AND OWSTON'S COLOUR AND CHEMICAL COMPANY, LIMITED.**—Registered by J. J. Ridley, 33, Old Broad Street, E.C., with a capital of £10,000 in 25 shares. Object, to acquire the business of colour and chemical manufacturers as hitherto carried on by Newman and Owston, and extended and extended. The directors are G. J. Newman and W. A. Owston, senr. Qualification not specified. Remuneration to be fixed by the company. Managing director, J. G. Newman, his remuneration as being such being 20 per cent. of the net profits.—**Financial News.**

**WANDSWORTH CHEMICAL WORKS, LIMITED.**—This company was registered on April 1 with a capital of £10,000 in 51 shares (750 pref.), to acquire and carry on the business carried on by a company of the same name, and to enter into an agreement with the said company and its liquidator. The number of directors is not to be less than three nor more than five; the first are F. G. Grieson, E. A. Haughton, L. Cunliffe, and E. M. M. Ewan-Smith; qualification, £100 remuneration, £50 each per annum. Registered by Sutton and Co., 3, and 74, Great Winchester Street, E.C.—**Investors' Guardian.**

**LEWIS AND BURROWS' DRUG STORES, LIMITED,** with a share capital of £200,000, divided into 50,000 per cent., cumulative preference shares, 60,000 ordinary shares, and 100 deferred shares of £1 each, has been formed for the purpose of acquiring and amalgamating under one general management eleven drug store businesses carried on in various parts of London and the suburbs. The purchase price of the leases, goodwill, stock, plant, and fixtures of the several businesses has been fixed at £250,000, which is to be paid as £235,000 in cash, as £15,100 in ordinary and deferred shares, and as to the balance of £15,000 in cash or shares, at the option of the directors. The 100 deferred shares are entitled to one-half of the profits after 10 per cent. has been paid on the ordinary shares. There are now offered for public subscription 25,000 preference and 51,000 ordinary shares.—**Financial News.**

JAYA FABRIC.—A company, to be called the "Java Fabric," is in course of foundation to deal in quinine and other chemicals in Burmah, and generally to afford assistance to the planters, who have been for some time in the hands of a ring of quinine merchants in Holland, who keep down the price of bark to starvation point, and run up the price of the finished article, which, during the last few years and largely owing to the quantity of quinine administered in the influenza period, has been a most profitable business. The planters, it appears, will bind themselves to sell the bark to the "Java Fabric" for a fixed period and at a price double that which the Dutch gentlemen have been giving. They will also retain the option of taking shares in the company.—**Financial Times.**

New Books and New Editions.

**OUR TEETH, BY VOOGHT DITCHAM, M.D.** (Ballière, Tindall, and Cox, London.)

**LEHRBUCH DER BIOLOGIE DER PFLANZEN.** Von F. Ludwig. 14 marks. (Eke, Stuttgart.)

**DIE CHEMIE DES CHLOROPHYLLS.** Von L. Marchlewski. 2 marks. (Voss, Hamburg.)

MARKET REPORT.

Chemicals and Drugs.

[The quotations here given are in all cases the lowest net cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the pharmacist. It is important that this should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.]

THE CHEMICAL MARKET.

THURSDAY, APRIL 18, 1895.

Business in the Chemical Market has necessarily been somewhat restricted during the last week owing to the holidays, but in most cases prices are well sustained, and in one or two instances advances have occurred. Citric acid continues a dull market at unchanged rates but tartaric acid is still in good demand at fully steady rates, and a further advance both of foreign and English brands is not unlikely. Of ammonia compounds, sulphate continues a very weak market and prices at the close are somewhat easier. Carbonate of ammonium and sal ammoniac is unchanged. Borax is a somewhat firmer, at unaltered rates, but sulphate of copper is very quiet at easy rates. Ashes and arsenic are unaltered at steady prices. Cream of tartar shows a very firm market, and bismuth has been very brisk both in French and German makes at an advance of fully 1s. for both powder and crystal. Importers' prices for quicksilver are unaltered, whilst in second hands it is offered at 6d. less. The advance noted last week has not affected the price of mercurials. Potash and soda compounds are unchanged.

ACID CITRIC.—Unaltered, but there has been no demand, and quotations are to a great extent nominal. The prices returned are still 1s. 13½d. to 1s. 2d., according to quality.
ACID ORMOC.—The price is maintained at 53½d. net ex rails.
ACID TARTARIC.—Has again been in brisk demand, and prices are well maintained. A further advance is not unlikely. English makers' prices are as yet unchanged at 10½d. to 11d., foreign brands being returned at 10½d.
AMMONIA COMPOUNDS.—Sulphate: The market remains as brisk, and prices are again easier at a fall of 2s. 6d. on last week's rates. Grey 24 per cent. is now returned at 8s. 10s. Carbonate: Unchanged at 35½d. to 35½d. Sal ammoniac: Prices are unaltered, first quality being worth 30s., with secondaries at 37½d. Ammon.—Steady at unchanged rates. Americans being worth 48s., with pots at 25s.
Aspic.—Best white powder is unaltered, and returns at the steady rate of 1s. 6d.
BLEACHING POWDER.—A fair amount of business has been done at the steady rates of 5s. to 5s. 3d.
BORAX.—The Convention prices are unaltered from the previous rates of 20s. for crystals and 21s. for powdered, but outside manufacturers continue to offer at 1s. to 1s. 6d. lower than the combination, and a fair amount of business has been done at these rates.
COPPER SULPHATE.—The market has been dull, and since our prices are somewhat easier. Quotations, which are more or less nominal, are now 14s. 15d., with 15s. 6d. asked for the best brands.
CREAM OF TARTAR.—The demand has continued very brisk, and prices have been considerably advanced. The best white French crystals are now quoted at 65s., whilst German powder is worth 8½d. on the spot.

THE DRUG MARKET.

THURSDAY, APRIL 18, 1895.

Since our last business in the Drug Market has naturally been somewhat limited, although some changes of importance have occurred. Advanced prices continue to be paid for caffeine, which is exceedingly scarce. In crude camphor there has been but little business, and quotations are, to a great extent, nominal, as there are no sellers; the refined article is unaltered. The makers of cocaine have lowered their prices 1s. per ounce, as our last. The opium market is dull, and the prices of the various grades have been still lower. Values of Hio and Carthamnus root have been made privately at steady rates. Balsam of Peru continues very scarce, and is held at advanced prices. Jalap remains dull of sale, whilst coloosynth and copals are steady. Of the essential oils anisised and cassia are quiet but steady at last week's rates, whilst menthol is unaltered. Salicyl is steady at unchanged rates. Of the various fixed oils and spirits, petroleum continues to advance in price, whilst turpentine has been a very steady market, and prices are moving up. In quintine the market is firm, but little business has been done.

CAFFEINE.—Since our last report small quantities in second hands have been sold on the spot at fully steady rates. For one parcel 21s. has been paid, and this would be now refused, holders asking 22s. 6d., and we believe this has been paid in some instances. For forward delivery, July-August 17s. is a fair quotation.
CAMPHOR (Crude).—There has been but little business done in the absence of sellers; still, the market remains firm at high prices; on the spot, the quotation for Japanese remains 125s., with Chinese at 117s. 6d. to 120s. For arrival there is no lack of demand; nominally, quotations remain at 127s. 6d. c.i.f. for Chinese, and 130s. c.i.f. for Japanese, both April-May shipment.
CAMPHOR (Refined).—No move has been made by the English and German refiners, and quotations remain at 1s. 5½d. for bales and in 10 to 20cwt. lots, with spaces at proportionate rates.
COVERS.—Quiet. There have been no sales of Zanibar for delivery. Prices are unaltered.
COCAINE.—The manufacturers lowered their prices on the 16th inst. by 1s. per ounce, and the present quotations are as follows: Hydrococaine, 100 oz. lots, 13s. 5d. to 100 oz. lots, 12s. 6d.; smaller wholesale quantities, 12s. 9d., with 1 oz. bottles 3d. per oz. extra.
COCHINEAL.—Steady. Both black and silver are worth from 1s. 5d. to 1s. 6d.
CODINIA.—The manufacturers have again reduced their quotations, and it is now worth 11s. to 11s. 6d. according to quantity.
COLOSTYRE.—Steady. Good pale Cyprus and Turkey have been selling at fully last week's rates.
COPAIX.—There has been sales of bright Mosambek at 1s. 7d. to 1s. 7½d. Balsam and Paez is steady at 1s. 4d. to 1s. 5d.
Diary of the Week.

[No.ices for insertion under this heading should reach the Editor on or before Wednesday.]

MONDAY, APRIL 22.

Society of Arts (Cantor Lectures), at 8 p.m.

TUESDAY, APRIL 23.

Royal Institution of Great Britain, at 3 p.m.

-Alternating and Interrupted Electric Currents-, by Prof. John F. Daniell of George F. Bezold.

Society of Arts (Applied Art Section), at 8 p.m.

-Art of Casting Bronze in Japan-, by William Gowland.

Institution of Civil Engineers, at 8 p.m. Ordinary Meeting.

WEDNESDAY, APRIL 24.

Geological Society of London, at 8 p.m.

An Experiment to Illustrate the Mode of Flow of a Viscous Fluid-, by Prof. W. J. Sollas.

-Supplementary Notes on the Statical Position of the Trolley-, by H. M. Bernard.

THURSDAY, APRIL 25.

Royal Institution of Great Britain, at 8 p.m.

-The Liquefaction of Gases-, by Prof. Dewar.

Society of Arts (Indian Section), at 8 p.m.

-The Coming Railways of India, and their Prospects-, by J. W. Parr.

Chemists' Assistants' Association, at 8.30 p.m.

-Essential Oils in their Relation to (1) The British Pharmacopoeia: (2) Trade-, by J. C. Umney.

Chemical Society, at 8 p.m.

-The Action of Nitroxy Chloride on Amides-, by Prof. Tilden and Dr. M. C. Forster.

-On a Property of the Non-luminous Atmospheric Coal Gas Flame-, by L. T. Wright.

-Di-ortho-substituted Benzoic Acids-, by J. J. Scibor

-Hydrolisis of Aromatic Nitrates and Acid-amides-, by J. J. Scibor

-Action of Sodium Etherylate on Deoxybenzoin-, by J. J. Scibor.

Liverpool Chemists' Association, at 7 p.m.

-Notes from the Dispensing Counter on some R.P. Preparations-, by H. O. Dutton.

FRIDAY, APRIL 26.

Royal Institution of Great Britain, at 9 p.m.

-The Effects of Electric Currents in Iron as in Magnetisation-, by John Hopkins.

Sheffield Microscopical Society, at 8.30 p.m.

Lecture, by J. H. Worrall.

Pharmacetical Society of Great Britain (North British Branch), at 8.45 p.m.

-Tetrazole Phosphates-, by George Corull.

-Note on Commercial Lined eat., by A. J. Day and W. B. Cowie.

SATURDAY, APRIL 27.

Royal Institution of Great Britain, at 8 p.m.

-English Music and Musical Instruments of the 18th, 17th, and 16th Centuries- (with illustrations upon original instruments), by Arnold Dolmetsch.

Geological Association (Travel Branch), to Exursion to Briggstock, Geddington, etc. Leave St. Pancras (Midland Railway) at 9 a.m.
MARKET REPORT.

Chemicals and Drugs.

[The quotations here given are in all cases the lowest net cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the pharmacist. It is important that this should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.]

THE CHEMICAL MARKET.

THURSDAY, APRIL 25, 1895.

Since our last, business in the chemical market has been generally somewhat improved, and some changes of interest have occurred. Citric acid remains steady at unaltered rates, but tartaric acid has again proved in very good demand, and, as seemed probable from our last report, both English and foreign brands have been advanced in price. Of the various ammonia compounds, sulphate is still a very dull market, and there have been considerable reductions, without, however, being accompanied by a reduction in the other ammonium compounds. Ashes and arsenic are unaltered at steady rates, whilst sulphate of copper is a dull market, at nominal prices. Cream of tartar is somewhat scarce and in good demand, and business has been done both in French and German makes at an advance of 1s. on last week's rates. The importers of quicksilver advanced the price on the 23rd inst. to 27s., and in second hands it is offered at 26s. 6d., consequently all mercurials were advanced 1d. per lb. on the 24th inst. Of the various potash compounds, prussiate is rather firmer, and chlorate has been steady at last week's rates, whilst permanganate is firm at unaltered prices. Soda compounds are unchanged.

ACID, CITRIC—Has been a quiet market at steady rates, and quotations are more or less nominal. It is still worth 1s. 3d. to 1s. 4d., according to quality.

ACID, OXALIC—Remains unchanged in steady demand at 2s. 3d. net ex rails.

ACID, TARTARIC—Continues a very firm market, and foreign makers have advanced their prices during the week, whilst English brands are held at the rate of 1d. Foreign acid, both in powder and crystals, is now quoted at 10s. 6d.

AMMONIA COMPOUNDS.—Sulphate: A very dull market, and prices have further declined 1s. 6d. since our last. At the close grey 24s. per cent. is quoted at £2 12s. 6d. Carbonate unchanged, but very quiet at 3s. 5d. to 3s. 7d. Sal ammoniac in dull demand at the nominal rates of 8s. for first quality, with seconds at 7s. 6d.

ASHES—Unaltered, American being steady at 40s., with pots at 23s.

ARSENIC.—Supplies are still but small, and best powdered white is firm at the rate of 15s.

BENZOILE.—Steady at unaltered rates; 50 per cent. is worth 1s. 0½d., with 90 per cent. at 1s. 1d.

BLEACHING POWDER—Has been in steady demand at the unaltered rates of 5s. to 5s. 6d.

SULPHATE OXALIC—Second-hand holders continue to offer at 1s. to 1s. 1½d. lower than the Convention prices, which are unchanged from the last rates of 20s. for crystals, with 21s. for powdered.

CREAM OF TARTAR.—The demand has continued very brisk, and prices have advanced 1s. more since our last. On the spot German powder is worth 65s., whilst the best while French crystals are quoted 75s.

MERCURIALS.—Consequent upon the further advance in quicksilver, makers of mercurials yesterday made an advance of 1d. per lb., and the current quotations for quantities up to 25 lbs. are now as follows: Calomel, 2s. 1d.; red precipitate, 3s. 1d.; white precipitate, 3s. 1d.; white nitre, 2s. 6d.; corrosive sublimate, 2s. 6d.

POTASH COMPOUNDS.—In somewhat improved demand. Prussiate is firmer at 8d. to 9½d., Chlorate, steady. Business has been done both spot and forward in London and Liverpool at the rate of 4¾d. Bichromate unchanged at 4½d. to 4¾d. Permanganate steady. Small crystals offer at 5s. 6d. to 5s. 8d.

QUICKSILVER—In first hands the prices have been again advanced, and it is now offered at £2 5s., whilst second-hand holders ask £2 1½s. 4d.

SALPETER.—On the spot Dungal is steady at the unaltered rate of 17s. 6d. for 8½ to 5 per cent., whilst for arrival April to June 17s. 6d. has been paid. British refined is worth 22s. 6d. to 23s. 6d.

SODA COMPOUNDS.—Caustic soda: Unchanged at £3 for 70 per cent., with 60 per cent. at 21s. less. Crystals: £2 10s. 6d. at 30s. Bicarbonate: 27s. 6d. (London). Hypophosphite: 6s. 3½d. in 1 cwt. kegs (Liverpool).

THE DRUG MARKET.

THURSDAY, APRIL 25, 1895.

In the drug market business seems now to have fairly settled down again, and during the last week has been fairly satisfactory. At the same time, some important changes have occurred, of which brief mention will be made. Extreme prices continue to be paid for cedrine on the spot whenever obtainable in second-hand. For crude camphor there are no offers on the spot, whilst for arrival steady prices are asked. There has been no movement in refined camphor. The manufacturers of cocaine have again lowered their quotations 1s. per oz. since our last report. Balsam of copaiba is very steady, and advanced rates have been paid, holders now asking still higher rates. This applies also to Peru and Tolu balsam, both of which are held for advanced rates. Jalap is at present very easy, but advanced prices are not unlikely. Colocynthis and buchu have been selling privately at steady rates. In ipecacuanha a steady amount of business has been done, especially in Carthagena root. The opium market is steadier owing to somewhat unfavourable reports as to the crop, and the various opium alkaloids are unchanged. Of the essential oils, advanced prices continue to be paid for Frankincense. This applies also to Peru and Tolu balsam, both of which are held for advanced rates. Petroleum has seen advanced prices during the week, but at the close is a quiet market, and quotations are again falling. Col- der oil remains very steady, and higher prices may be expected. Shellac is a firm market, and the same applies to quinine, for the best brands of which advanced prices have been paid.

BUCHU.—Sales privately of fair round green leaves have been made at the rate of 3½d.

CAFFEINE.—High prices have been paid for small parcels in second-hand; whenever obtainable, 25s. to 27s. have been readily paid, and it is doubtful if it could be bought now under 30s.

CAMPHOR (crude).—On the spot there are no offers of either Japan or China, and nominally quotations remain at 125s. for Japanese, with China at 112s. 6d. to 115s. For arrival Japan offers do not exceed 120s. 6d. c.i.f., and China at 100s. to 102s. 6d. c.i.f., both April to June shipment. From China, a brisk market is reported, with steadily advancing prices, 108s. c.i.f. being the present quotation.
CAMPHOR (refined).—Unchanged, and quotations still remain at 1s. 5d. per lb. for balls and flowers for 10 cwt. lots, with squares at proportionate rates.

CASCARA.—Fair quality bark offers privately at 18s. to 20s.

CLOVES.—Quiet but steady. For delivery June to August August, 10s. 9d. has been fairly well at 9s. 9d.

COCA LEAVES.—Rather scarce. A parcel of fine Ceylon leaves will be offered at the next drug sales.

COCAINE.—The price has again been reduced by the manufacturers, the current quotations now being as follows:—For 100 oz., or more, 18s. 6d., from 25 to 100 oz. lots under 25 oz. 19s. 9d. These quotations are for Cocaine in tons; 10s. bottles are charged 3d. per oz. more.

CODEINE.—Remains quiet at last week's rates of 10s. 9d. to 11s. 6d. according to quantity and brand.

COLOCYNTH.—Good pale Turkey balls have been selling at the steady rate of 1s. 8d.

COPAIBA.—Advanced and in steady demand. Sales of cloudy to bright Maranhons have been made at 1s. 6d. to 1s. 9d., and holders are now asking 1s. 10d. whilst forgood bright Maranhon, of Peruvian character, 1s. 6d. has been paid, and even 1s. 7d. is asked.

ICARUS (MAURITANIA).—Sales privately have been made at fully advanced rates. This especially applies to Carthageno root, of which several samples have been sold at 3s. 7d., at the steady rate of 3s. 6d. for slightly damaged goods.

JALAP.—Quiet. Holders are asking 1s., but offers of 11d. would probably be accepted for fair Vera Cruz. For arrival it is quoted at 9d. c.i.f. agent.

KENNY.—Steady at unaltered rates. Holders ask 15s. 6d. to 16s. on the spot.

MORPHINE.—Remains at the decline noted last week, the quotations being 4s. 5d. for 1000 oz. lots, and 4s. 7d. for smaller wholesale quantities.

OILS (ESSENTIAL).—Star anise: Very firm; on the spot sales have been made at 6s. 3d. to 6s. 4d., and as much as 6s. 6d. is now asked. For arrival it is quoted at 6s. 5d. c.i.f. terms. Cassia: Remains very firm, and has been paid during the week for oil containing 20 to 25 per cent. cinnamon aldehyde. For arrival it is firmer, the quotations being 4s. 6d., c.i.f. terms. Citronella: Very steady and firmly held. During the week 1s. 1d. to 1s. 5d. has been readily paid. For arrival it is quoted at 11s. 6d., c.i.f. terms. Lemon-grass: Dull of sale at 1s. 6d. Peppermint: H. G. Hotchkiss' oil is quiet at 9s. 9d. Japanese oil containing 40 per cent. of menthol is steady at 8s. 6d., whilst domestic is quiet at 6s. 7d. Menthone: Steady at 5s. 6d. per cwt.

OILS (FIXED).—Warm weather firm, but the market is now quiet. The closed quotation is 5s. 6d. per cwt.

PEPPERMINT.—Firm. The closed quotation is 5s. 6d. per cwt.

PETROLEUM.—A further advance on the previous quotations, but no sales have been made above 5s. 6d. per cwt.

POTASSIUM CHLORIDE.—Remains firm at 5s. 6d. per cwt.

SALICIN.—Is very steady at unaltered rates, makers' quotations being 8s. per 1 cwt. lots, with 28 lbs. at 8s. 6d.

SKEWEG—Fair root has sold privately at the steady rate of 10s. 9d.

SHELLAC.—Extremely firm, and holders are very reluctant to part, except at higher prices. Small sales privately of Second Orange, on a basis of 10s., for reds 17s. At 10s., a quantity of 100 lbs. to Mr. C. G. Turner sold at 10s. per cwt. for cask qualities, ordinary Seconds Botton at 10s. to 10s. 6d.

SOY.—The market continues firm, and small sales of fair China have been made at 1s.

TULIP (BALSAZ).—Steep. As a rule this business has been done at 1s. 4d. to 1s. 5d., but to no great extent, as holders are not very anxious to sell at these rates, and as much as 1s. 3d. is asked.

WAX (JAPAN)—In steady demand at 2s. 6d. to 2s. 7d. for the spot good squares. For arrival April to May shipment it is quoted at 2s. 6d., c.i.f. terms.

Late News.

ELECTRICITY FOR HEATING AND COOKING.—Mr. R. E. Crompton, President of the Institution of Electrical Engineers, read a paper on April 24 on "The Use of Electricity for Heating and Cooking" at a meeting of the Society of Arts, which was held in the rooms of the society, John Street, Adelphi. Mr. W. H. Preece was in the chair. Mr. Crompton said it was up to the present time the utilisation of electrical energy for the purposes of heating and cooking had been regarded by the public, and even by many who had technical knowledge, as impracticable and too costly; but that so far from this being the case, heating and cooking by electricity had really advanced to a highly useful and practical stage. Having declined slightly the manner in which the heat was generated and the various inventions which were necessary before the result could be attained, Mr. Crompton dealt with the subject of expense. The first idea, even of a skilled engineer, would be that the process would be too expensive, but those opinions were based on an insufficient knowledge of the economy—or rather extraordinary want of economy—in cooking as carried on at present by the ordinary kitchen grate. It is not too much to say that in many kitchens not more than 2 per cent. of the heat units of the coal burnt was utilised for cooking purposes, while with a properly arranged griller, heated by electric means, fully 60 per cent. of the heat energy was utilised in the meal. Mr. Crompton concluded by expressing the opinion that there was no reason why in a few years to come quite a majority of the users of electric light should not do all cooking operations of the nature of roasting, stewing, and frying by electrical means. The paper was illustrated by means of the various devices used for generating the heat, and of cooking utensils, many of which were in actual use, including gas rings, frying-pans, and an oven. —Daily News.

The Royal Commission on Tuberculosis—the British Medical Journal—publishes a summary of the report of this Commission as follows:—The Commission was appointed in July, 1890, to inquire into "The Effect of Food Derived from Tuberculous Animals on Human Health." The two main lines of inquiry were to determine (1) the circumstances under which the meat and milk of tuberculous bovines were liable to convey tuberculosis to those who consumed these articles of food, and (2) how far ordinary processes of cooking could be proved to render innocuous meat and milk, proved under the first head to be dangerous. The Commissioners point out that the danger is real. They say that the actual amount of tuberculosis disease among certain classes of food animals is so large as to afford to man frequent occasions for contracting tuberculosis disease through his food. As
to the proportion of tuberculosis acquired by man through his food or through other means, we can form no definite opinion, but we think it probable that an appreciable portion of the disease of tuberculosis in man is obtained through his food. The recognition of tuberculous disease during the life of an animal is not wholly unattended with difficulty. Happily, however, it can, in most cases, be detected with certainty in the udders of milk cows. Provided every part that is the seat of tuberculous matter be avoided and destroyed, and provided care be taken to save from contamination by such matter the actual meat substance of a tuberculous animal, a great deal of meat from animals affected by tuberculosis may be eaten without risk to the consumer." The following are the final conclusions of the Commissioners: "Ordinary processes of cooking applied to meat which has got contaminated on its surface are probably sufficient to destroy the harmful quality. They would not avail to render wholesome any piece of meat that contained tuberculous matter in its deeper parts. In regard to milk, we are aware of the preference by English people for drinking cows' milk raw, a practice attended by danger, on account of possible contamination by pathogenic organisms. The boiling of milk even for a moment would probably be sufficient to remove the very dangerous quality of tuberculous milk." Heat does not penetrate a joint as completely as it should, and it is obvious that the more thoroughly it is done through the less chance is there of contamination. As to milk, which is credited not only with a good deal of tuberculous, but with half the scarlet fever that exists, there seems to be a simple and easy mode of procuring absolute safety. All milk used in the family should be boiled, or it should be brought to within a dozen degrees of boiling point. If this were universally done a large amount of disease would be stopped at once.

**SALE OF EMBROCATION WITHOUT MEDICINE STAMP.**—On April 23, at Liverpool, John Kirby Pilkington, veterinary surgeon, Fox Street, was summoned by the Inland Revenue authorities for selling a medicine for human use without having a revenue stamp affixed to the bottle. It was stated that the defendant sold embrocations for the use of animals and human beings, both being almost of the same consistency. The embrocation bottles for human use were not stamped, but as the shipment of the embrocation, which was stated, was frequently bought by human beings for personal application, was not stamped. A fine of 40s. and costs was inflicted.

**THE SALE OF POISONS.**—The feelings of the Newcastle Daily Leader appear to be hurt, if one may judge from the following effusion in its issue of the 23rd inst., which refers to the case reported on page 954 of this week's Journal:—"The Pharmaceutical Society of Great Britain has been playing the great grandmother to some purpose for some time, and there was an illustration of it at Newcastle County Court yesterday. A chemist's apprenticeship was fined £5 for selling a bottle of chloroform which contains a little poison, in the belief that it was a patent medicine. Whether he might have sold it safely if he had been what he thought it was not appear, and probably is not known, so mysterious are windings of the law and of practice. The offence seems to have been a pardonable one. The sale of poisons has been hedged round with restrictions in respnce to the clamour which arises when some poor creature succeeds in poisoning himself with too much ease that the life of a chemist is made a misery to him. And the satire of the whole business is that the poisoning of oneself is as easy as lying."

**ROYAL BOTANIC SOCIETY.**—The Second Spring Show at the Gardens of the Royal Botanic Society last Wednesday if possible beat the record; the Flowers of the New World and the Azaleas make a fine show. The flowers are so exceptionally beautiful, that it would be injudicious to draw comparisons. A charming group of azaleas was exhibited by Barrett, gardener to Mrs. Thornton. The queen of flowers was represented in various colours and new forms. Charles Turner's azaleas were the most remarkable for variety of colour. Orchids, begonias, daffodils, and everlasting flowers were all well represented. A magnificent white rhododendron, in Veitch's group, was especially remarkable, but it is out of the range of possibility to do justice to all the growers.

**PHARMACEUTICAL ENTERPRISE IN NEW YORK.**—In connection with the annual meeting of the National Wholesale Drugists' Association, held at New York last October, the publishers of the Pharmaceutical Era have just issued a large engraving containing the portraits of nearly two hundred members who attended this interesting meeting. The portraits will be valuable for variety of character. The engraving is long and over 2 feet wide, and is a very creditable production.

**The Late Robert Fitch.**—The Athenaeum says that Mr. Robert Fitch, F.S.A., who died at his residence, Woodlands, in the suburbs of Norwich, on the 14th inst., was a man who made a reputation for himself as an antiquary and geologist by his own sagacity and force of character without any of those social or educational advantages which are regarded as necessary conditions of success in life. Born at Ipswich, October 21, 1802, he was sent to the grammar school of his native town, where he acquired a smattering of Latin and Greek, and was apprenticed to his father, a chemist, in the business of the town. After serving his time he became an assistant for a few years in a shop in London, and in 1827 removed thence to Norwich, where he entered into partnership with his brother-in-law, Mr. Chambers, and where for the next sixty years he continued to serve behind the counter with the utmost regularity till some five or six years ago, when his health began to break down. To the last he might be seen any day wearing his large white apron and sitting on his customers as if he had no other thought than about small gains. Yet as early as 1844 he had been elected a Fellow of the Geological Society, and was already known as a vigilant and accomplished collector. His remarkable quick eye and a sound judgment. When the Norfolk and Norwich Archaeological Society was founded in 1843 Mr. Fitch was one of the original members. In 1849 he was elected a member of the committee, he became honorary secretary in 1859, and treasurer in 1872. This latter office he continued to discharge till five years ago. His collections were chiefly confined to objects of local interest, but they were very varied. He was in frequent communication with some of the most eminent men of science and antiquaries. In 1888 he was appointed a magistrate for the city of Norwich and at the time of his death was the oldest magistrate on the bench. In 1887 he served the office of sheriff. He discharges the office of honorary curator of the museum, and drew up a catalogue of the antiquities gathered together by himself. In his advancing years to retire from business, he executed a deed of gift by which he presented his antiquarian and geological collections to the Norwich Museum, taking upon himself the cost of the expenses of moving which are preserved and exhibited to the best advantage of visitors, and that he directed that these should be kept together in a room adapted for their reception and be called the "Fitch Collection."
Exchange.

[Notices of books, apparatus, etc., for exchange, not exceeding thirty words including name and address, are inserted free, but must not partake of the nature of ordinary advertisements.]

WANTED.

'Pharmaceutical Journal,' February 23, 1895.—Full price will be paid by the Secretary, 17, Bloombury Square, London, W.C.

Books.—'Practi and Vine's Botany,' 'Ganot's Philosophy,' 'Will's Analysis and Materia Medica,' Atfield and other major books, latest editions. Condition and price to Floyd, Chemist, Haverhill.

'British Medical Journal' for January 6, 1894. Full price will be given. Pharmaceutical Journal office, 17, Bloombury Square, W.C.

OFFERED.

Books.—'Women' by Dr. Graily Hewitt, 3rd Ed., 10s. 6d.; Allingham's 'Diseases of the Rectum,' 7s. Both contain numerous engravings, and are new.—J. Allen, Chemist, Plymouth.

Company Business.

Pritchards, Limited.—This company was registered with a capital of £20,000 in 21 shares to carry on the business of dispensing and family chemists, wholesale druggists and drysalters, manufacturers and packers of druggists' sundries and proprietary articles, sauce and pickle manufacturers, etc., also to enter into an agreement with John Pritchard, of 71 and 73, High Street, Cheshunt, Herts. The first subscribers (who each take 1 share) are:—J. Pritchard, chemist and druggist; J. G. Pritchard, manager; Mrs. M. A. Pritchard, Miss M. M. Pritchard; W. Pritchard, clerk; Mrs. J. E. H. Pritchard, H. B. Tierney, Mrs. J. A. Tierney.

Edward Aspinall, Limited.—Registered with a capital of £15,000 in 21 shares. Object, to acquire the business of a manufacturer of cosmetics, soaps, and other proprietary articles as now carried on by H. E. Aspinall, and to develop and extend the same.

Homoea Company, Limited.—This company invites subscriptions at par for £19,900 of 6 per cent. debenture stock, being the balance of an issue of £25,000, of which £5700 has already been subscribed. The company was established in February last, and the debenture stock is now issued in order to provide funds for paying off a charge of £5000, and for extending and developing the business of the company.

Late Advertisements.

Business for Disposal.

Druggists' Sundries.—The Excise of late George Scriven, Brierley Hill, are prepared to open negotiations for Disposal, as a going concern, of Medical Glass and Sundries Business and Goodwill; established 1856; only about £5,000 capital required. Apply, by letter in first instance, to G. Scriven, Chartered Accountant, Victoria St., Nottingham.

Assistants Wanted.

Assistant and Apprentice wanted.—In-door Assistant (qualified preferred), age about 23, for permanent situation. State full particulars, salary required, also enclose photograph (if convenient) which will be returned. Wanted also as Apprentice a well-educated youth, about 16, who has passed Preliminary Examination. Comfortable home. Gorbelle, Chemist, Sittingbourne.

Diary of the Week.

[Notices for insertion under this heading should reach the Editor on or before Wednesday.]

Saturday, April 27.

Pharmaceutical Cricket Club v. Crown C.C., at Kasing. Train from Paddington at 1:50 p.m. Monday, April 22.

Society of Arts (Cantor Lectures), at 8 p.m.

"Recent American Methods and Appliances Employed in the Metallurgy of Copper, Lead, Gold, and Silver" (Second Lecture), by James Douglas.

Tuesday, April 23.

Royal Institution of Great Britain, at 3 p.m.

"Alternating and Interrupted Electric Currents" (Second Lecture), by Prof. George Forbes.

Institution of Civil Engineers, at 8 p.m. Ordinary Meeting.

Wednesday, May 1.

Royal Institution of Great Britain, at 5 p.m. Annual Meeting.

Royal Society. Soirée.

Society of Arts, at 8 p.m.

"Deviations of the Compass." by Prof. A. W. Reinold.

Edinburgh Pharmacy Athletic Club, at 9:15 p.m. Annual General Meeting.

Thursday, May 2.

Royal Institution of Great Britain, at 3 p.m.

"The liquefaction of Gases" (Second Lecture), by Prof. Dewar.

Chemists' Assistants Association, at 8:30 p.m. Annual General Meeting.

Lincoln Society of London, at 8 p.m.

"The Distribution of Plants on the Southern Side of the Alps," by the late John Ball, with an Introduction by W. T. Thesilton Dyer.

School of Pharmacy Students' Summer Concert, at 7 p.m.

Friday, May 3.

Royal Institution of Great Britain, at 9 p.m.

Edinburgh Chemists' Association, at 9:15 p.m.

"Dispensary Notes," by William F. Hay.

"Ergot," by John Harris Burns.

Saturday, May 4.

Royal Institution of Great Britain, at 3 p.m.

"Music and Musical Instruments of the 16th, 17th, and 18th Centuries," with illustrations on orignal instruments (Second Lecture), by Arnold Dolmetsch.

Personal and Trade Notes.

The Liquor Carnis Company, advertizing to the subject of the purchase of their business and patents by the managing director, Mr. Shepperson, in August last year, the legal formalities in connection with which transfer have now been concluded, write to say that, of course, the business remains in precisely the same condition as before the purchase, with the same title, the same offices and manufactory, the same management, and the same staff.

Mr. John Buchanan, chemist and druggist, of Cullens, N.B., has removed to 71, High St., Leven, having purchased the business of Mr. Robert Johnston, chemist and druggist. Mr. Buchanan had resided in Cullen for eleven years and had gained during that time great respect. He had for the last few years held official civic positions in the burgh, first as councillor, then as dean, then as junior bailie, and latterly as senior bailie.

At a meeting of the Crickhowell Board of Guardians held on the 8th inst., Mr. J. P. Hughes, of Abercarn and Crickhowell, was appointed dispenser and drug contractor to the Crickhowell Union for the next six months. At a meeting of the District Council held on the same date, Mr. Hughes was also appointed, conjointly with Mr. Harris, to supply the council with disinfectants.
SUPPLEMENT TO THE
Pharmaceutical Journal and Transactions.

LONDON, MAY 4, 1895.

MARKET REPORT.

Chemicals and Drugs.

[The quotations here given are in all cases the lowest net cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the pharmacist. It is important that this should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.]

THE CHEMICAL MARKET.

THURSDAY, MAY 2, 1895.

There have been but few changes in the chemical market since our last report. Cream of tartar continues a very firm market, and advanced prices have been paid; whilst tartaric acid has been selling at fully steady rates. Sulphate of ammonia is still very flat, and has again declined in price. Copper sulphate is rather firmer. Fuller details will be found below:

ACID CITRIC—Has been in fair demand throughout the week at previous quotations. It is still worth 1s. 11d. to 1s. 3d. according to quality. ACID TARTRIC—The price of this acid has been in full accord and steady at 1s. 3d. per lb. at all stations.

AMMONIA SALTS.—A flat market generally, and although the sulphate is the only compound which has declined in price during the week, a general reduction is not improbable. Carbonate—Remains dull of sale at 8s. 3d. to 8s. 4d. Liquor:—Unchanged at 8s. to 8s. 4d. Murata—Quotations at the nominal rate of 9s., for first quality, with 7½ per cent. asked for seconds. Sulphate—Continues to fall in price, and grey 5 per cent. is now quoted at 2s. 10d.

ASHES.—There has been a steady sale for both American and native ashes; quotations being, however, unchanged, the former being still worth 40s., with pots at 55s.

ANTHRACITE.—No change is to be noted, and best powdered white is still worth 15s.

BENZOL.—Fifty per cent. is easier, and is now quoted at 1s., whilst 90 per cent. is fairly steady at 1s. 1d.

BERRING POWDER.—Has been in good demand at fully steady rates. On the spot from 27 to 27½ 10s. has been paid, whilst in Liverpool it is quoted at 27 to 27½ 5s. f.o.b. or on rails.

BORAX.—No change has occurred, and Convention prices are maintained at 20s. for crystals, and 30s. for powder. Second-hand holders continue to offer at 1s. to 1s. 6d. less.

CARBONATE OF SULPHUR.—A fair amount of business has been done at steady rates, especially in the better brands, but the improvement is only likely to be temporary. It is quoted at 21s. 10d. to 22s. 10d., according to brand.

CARBON OF TARTRIC.—The market continues exceedingly firm, and business has been brisk at an advance of 1s. on last week’s rates. German powder is now worth 65s. on the spot, whilst 67s. has been paid for the best white French crystals.

CARTRIDGE.—Quotations remain unchanged at the advance notified last week, Colomei being worth 2s. 10d.; red precipitate, 8s. 1d.; white ditto, 8s. 1d., and corrosive sublimate, 2s. 6d.

COPPER SULPHATE.—Unchanged, the market being quiet. Bichromate is steady at 4s.4d. to 4s. 6d. Chlorate, quiet at 4s. 4d. in London, whilst in Liverpool it is quoted at 4s. 4d. to 4s. 6d. f.o.b. Permanganate unchanged, small crystals offering at 52s. 6d. to 55s. Prussiate, fairly steady at 9s. to 9s. 4d.

QUICKSLIVER.—Unaltered. Importers maintain the price at 27, whilst second-hand holders offer at 26½ 10s. 6d.

SALT PETERS.—A steady market. Bengal is firm at the unaltered rate of 17s. 9d. for 2cwt to 5 per cent. on the spot, whilst for arrival, May to June, sales have been made at 17s. 3d. British refined is still worth 22s. 6d. to 23s. 6d.

SODIUM COMPOUNDS.—Generally quiet and unaltered. Bicarbonate, 27 5s. (London). Caustic 70 per cent., uncharged at 28, whilst Caustic 60 per cent. is worth 21 1s. 6d. Crystals steady at 30s. Hyposulphite, 25 5s. in 1 cwt. bags (Liverpool).

THE DRUG MARKET.

THURSDAY, MAY 2, 1895.

The amount of goods offered at to-day’s sales was so large that a postponement until to-morrow was necessitated in order to complete them. Details of the various articles are given below:

ACACIA.—A fair amount was offered, but met with no demand. Turkey sorts were bought in at 65s., and picked white gum at 65s.

ACEREBUS.—Only a small quantity was offered to-day, and was all bought in at the following rates:—East Indian (Soozo) trine at 70s. to 75s. for fair, soft brown of good aroma, and Carvano at 45s. for fair brown.

ACABERIS.—The best quality goods sold to-day at 60s. per cwt. for ordinary grey of fair aroma.

AMMONIAC.—None was sold to-day. A parcel consisting of 57 cases was bought in at rates ranging from 50s. 6d. for good bold, partly mixed, down to 27s. 6d. for small white gum mixed with seeds.

AMMWOOD.—Thirty bags Spanish was bought in at 33s. AMMOTHORUM—Remains quiet. Twenty bags of fair bright Madras seed were bought in at 3s. 3d. to 4d.

ARECA NUTS.—Out of a parcel of 44 bags, 4 sold at 10s., the remainder being bought in at 12s. 6d.

ARAPIUM.—A large amount was again catalogued, amounting to nearly 600 cases. Out of the first lot consisting of 150 cases, one only sold at 65s. for good pinkish block, rather earthy and soft.

ASON.—Largely offered to-day. The best qualities of Bismarck gum sold at £21 for fine hard pale loose almonds; £20 5s. 6d. to £25 5s. was paid for small drop, partly blocky, and 45s. common grey and brown sifting. Bold, fine hard pale gum was bought in at £23. PENANG: Ten cases of glassy seconds sold at 77s. 6d. Sumatra met with good demand, and 22s. 6d. was paid for good seconds, fairly packed; 26s. 10d. for medium seconds, half-packed sides; 6 cases of dull thirds, with fair centres sold at 82s. to 89s. 6d.

ALUM.—The supply to-day was only small, when 10 packages were offered, all of which were sold at the steady rate of 8s. 4d. for good round green leaves, somewhat stalky.

APE.—Sales of small parcels have been made at the rate of 25s. to 27s., always in second-hand, and it is fairly bought whenever obtainable. For delivery, July to August, it is selling at 23s. to 24s.; also in second-hand.

CUMMINS ROOT.—Entirely neglected. Brownish sorts, rather wormy, were bought in at 11s., the remainder, consisting of fair yellow, was bought in at 36s.

CAMPHOR.—After fluctuating considerably earlier in the week, the market in crude China is very firm at steadily advancing rates, but business is somewhat limited owing to the firmness of holders. Spot sales are mostly confined to China for which 117s. 6d. has been
paid, 116s. having been bid and refused. For Japan there are no offers, and quotations remain nominally at 126s. For arrival sales in China have been made at 110s. to 112s. 6d. c.i.f. April to June steamer.

CAMPHOR (Refiners).—Quotations still remain unaltered at 1s. 10d. per 100 lb. exporters in 10 cwt. lots, with mortgage at proportionate rates.

CANNABIS INDICA.—Twenty-three robbins were offered. Of these ten sold at 2½d. for fairish green, stalky tops, the remainder being bought in at 8d.

CANTHARIDIN.—Five cases of medium Chinese flies were bought in at 11d. to 1s. 4d.

CARAMBOL.—Ten kegs were bought in at 1s. 5½ per cwt.

CARDAMOM.—Largely offered to-day, and met with a fair demand. The prices obtained were as follows:—Ceylon-Mysore: Medium to bold pale plump 2s. 10½d. to 3s. 6d.; fair sized pale to medium ditto 2s. 5d. to 2s. 9½d.; small to medium white 2s. 2½d. to 2s. 8½d.; dull and split, 1s. 11d. to 1s. 6d. Sekele were in good demand at 1s. 9d. to 2s. Ceylon-Malabar, small to medium sold at the steady rate of 1s. 6d. to 1s. 9d.

CASCARA SAGRADA.—One hundred and twenty-five bales were offered to-day, but were all bought in at from 18s. 6d. to 20s. for fair quality bark.

CHINESE RHubarb supply only; 10 bales of small silvery quills were bought in at 55s., and 29 barrels of sifting at 80s.

CASSIA FISTULA.—Thirty packages of medium size sold at 1s. 6d. to 1s. 8d.

CINCHONA.—A moderate amount was offered to-day, and South American Calisaya was bought in at 9½d. to 1s. Red bark at 4s. Java at 1s. and Maracacbo at 1s. 2½d. A parcel of 40 sersums of Crown bark met with a good demand, but not sold, at 11½d. with 6d. to 6d. paid for first class damaged.

COCAINE.—Remains at the reduction noted last week, quotations being still as follows:—For 100 ozs. or more, 1s. 8½d. to 2s.; for 10 ozs. 1s. 6d.; for lots under 10 ozs., 1s. 9½d.; for Cocaine in tins, 1-oz. bottles being charged 9d. per oz. more.

CODINE.—There has been no further reduction, and quotations remain at 10s. 9d. to 11s. 9d., according to quality and brand.

COLOCYNTH.—In very moderate supply, and the scarcity continues. 4 cases of small broken Spanish were bought in at 1½d. to 1s.

COPIA BALSAM.—At to-day's sales 3 casks bright Moramian were bought in at Is. 9d. to Is. 10½d., and 9 cases of Balsa at Is. 6d.

COXINDER BIRD.—East Indian seed continues plentiful: 4 cases were bought in at 11½d.

CURARE.—The supplies are only moderate, and it was all bought in. Good berries from Singapore are held at 52s. 6d. to 55s.; medium ditto for 45s.; and muddy stalks and root for 35s.

DRAGONS BLOOD.—The supply was only moderate. One case of Singapore was sold at 27s. for fine lumpy, and the remainder was bought in at 25½s. 6d. for dull hard sours, to 21½s. 6d. for bold gum of good fracture.

ERGOT OF RYE.—At auction to-day all the Spanish offered was bought in at 8½d.

GALLS.—Turkey were in fair supply, and a moderate amount was sold at 40s. to 45s. Two cases of white galls sold without reserve 25s.

GAMBoge.—In good demand. Ordinary gum dull, and partly blocky sold at 25 5s. to 27s.

GUAIACUM GUM.—Bought in at 3s.

HONEY.—Jamaica with fair demand at 20s. 6d. to 27s. 6d. Australian was all bought in at 21s. to 28s., whilst choice New Zealand was bought in at 40s.

IPESCUANHA.—A few bales of Carthagoena (Brazilian) root were bought in at 5½d. to 3s. 6d. for very ordinary damaged root, the remainder was bought in at 3s. to 3s. 6d.

JABORANDI.—Seven bales of very mixed leaves, with a large amount of stalk, were sold without reserve at 1½d. to 2½d.

JALAP.—A parcel of eighty-two bales sold freely at very low rates from 6½d. to 9d., according to quality and condition.

JASMINA.—A small quantity of fair quality West Indian were sold in at 1s. 6d. The remainder was all bought in at 1s. 4d. to 2s.

LIQUORICE ROOT.—Fifteen bales unsold Persian root sold in at 5s., the remainder was bought in.

MENTHOL.—Remains very firm, and on the spot 18s. is asked for good white dry crystals.

MORPHINE.—Remains quiet at unchanged rates, 1,000 oz. quantities sold in at 4s. 6d. and 4s. 7½d. for smaller quantities.

MYRRH GUM.—An average amount was offered to-day, when 5 bales of ordinary to very good pickings sold without reserve at 2s. 5d. to 2s. 7½d. Good native picked gum was worth 90s.; good sort, 55s. to 60s.

OILS (Essential).—Star Anise: very firm, and 6s. 5d. has been paid during the week, 6s. 6d. being now in many cases asked for. Atto arrival, 6s. was asked for, although 6s. 5d., c.i.f., continues to be the quotation, this will probably be further advanced. Bay leaf: one case Dudge and Oldicott's oil was bought in at 10s. Bergamot: 4 cases were bought in to-day at 3s. 9d.

Cassia: Remains very steady, and 5½ continues to be paid on the spot for oil containing 70 to 75 per cent. cinnamic aldehyde. For arrival is again firmer, and is now quoted at 4s. 6d. c.i.f. Citronella: Remains firmly held at 1s. 2d. at which rate sales have been made on the spot. For arrival it is quoted at 1s. 1d. to 1s. 1½d. c.i.f. Clove: English oil remains dull of sale at 2s. 5d. to 2s. 6d. Eucalyptus: 16 cases were bought in to-day at 1s. 9d. 16 cases at the same price and condition were also bought in. Lemon. Four doupers sold without reserve at 9d. Lemon Grass continues dull of sale at 1½d. Lime. Five cases bought in at 8s. Nutmeg, bought in to-day at 3s. Pepper: high at 29s. 10d. H. D. & Co. and others' were bought in at 1s. 6d. to 1s. 8½d. nominally. Japanese oil containing 40 per cent. of menthol is fairly steady at 8s. 6d., whilst dementholised oil is unchanged at 6s. 6d. Rose, sold to-day at 1½d. and settling at 1d.

OILS (Fixed) and Spirits.—Cod Liver: Finest non-congealing new oil continues to be quoted at 140s. per barrel of 25 gallons. Twenty-five barrels of Newfoundland oar were bought in to-day at 6s. 4d. per gallon. Cottonseed remains steady at unchanged rates, 1 quan- tified oil being still £18 to £19, according to brand. Cocos.—Quiet. On the spot Ceylon is still worth £23; Cochín, £24 10s. to £25; Mauritius, £25 nominally. Lecarced: A steady market, both on the spot and for delivery. The spot quotation for barrels remains at 230 3½s. 6d. to 250 5s. Roaph steady, refined oil being still worth £25 10s. Turpentine slow of sale. American spirit on the spot is now quoted at 25s. to 53s. Petrolium: In contrast to the recent boom the market is now quite sluggis, and American oil is quoted at 9d.; water white at 9d., with Russia at 7½d. Petroleum spirit: Americans 7½d. to 7½d. at Marseilles.

ORIUM.—The demand for good quality Persian continues, and 18s. has been paid during the week for fine quality. For other varieties, prices remain practically unchanged. Turkey.—Soft Shipping descriptions 1½s. to 1½s., whilst Druggists' opinion is nominally set at 10s. to 10s. 6d. for good qualities, with seconds at 9s. to 9s. 6d., but there are no enquiries.

ORIS Root.—Firmly held. To-day best selected Florence was bought in at 30s. to 35s., with sorts at 70s. to 75s.

NUX VOMICA.—In good demand at 5s. 6d. to 6s. per cwt.

QUININE Sulphate.—Has continued a very firm market. Since last week a large amount of business has been done in the best German makes at advanced rates, the principal item being a sale of 50,000 ounces of £3 ½s. and Brunsvick, most of the former, for the Japanese market at 1s. For October Delivery there are sales of H. & R. still at 3d., and Auerbach at 1s. 4d.

REUBARBS (Chinks).—Bold round Canton was bought in at 1s. 6d., flat ditto at 1s. 6d., medium round at 1s. 5½d., small ditto at 1s. 3½d., and Shamsa at 1s. 2½d. A few cests of Canton sold at 10d. to 11½d.

SARRASAMILLA.—Lima Jacobins sold briskly to-day at 9d. to 10d.

SARACAGHANT.—A parcel of 17 bags was offered low, when six were sold for 35s., and one for 32s.

WAX (Bees).—Jacobins: Sold at 28 7s. 6d. to 28 18s. Madagascar: In good demand at 2½ to 2½s. 6d. Aurum: Sold steadily at 27 10s. to 27 12s. 6d. Zambesi: £20 to 2s. 6d. to 27s.
Last Week's Gum Sales.

Messrs. G. N. Souratly and Co. report on last week's Gum Sales as follows:

**Gum Araraum.**—At the monthly auction held yesterday, the supply of East Indian kinds brought forward was less than at any previous sale this year, comprising in all 1224 packages (about one-third of which was Ferreta Insoluble, for which there is at present no demand). The tone of the sales was dull throughout, and in all only 261 packages sold, including 38 cases Ghatti disposed of previous to auctions. Of other descriptions, 401 packages were offered, the bulk of which was bought in, only 33 packages Turkey sorts and 7 bags Australian selling under the hammer. Prices generally show little or no alteration, excepting Turkey berberis, which declines.

The assortment consisted of:

**Amrak Kurrachree.**—Drop of the better kinds; nothing sold; middling reddish sold at 82s. 6d. Ordinary, 35s.; brownish peas size, 32s. Pickings fair to good, red, 25s. to 27s. 6d.; dark, 22s. Siftings sold pale grains, 30s.; fair pickings, 29s. Ordinary dust, 21s.

**Amrak Cawpore.**—Good palish drop, 35s. to 35a.

**Amrak Brown.**—Fair to good; fair drop, 28s. 6d. to 27s. 6d.

**Ghati.**—50 cases sold previous to auctions; 10 cases good pale and amber drop sold at 35s.

**Oomrah.**—Fair quality, 52s. 6d.

**Madras.**—Only 3 packages dark pickings; part blocky, sold at 35s.

**Aden.**—Pickled pale and amber, 46s.; ditto slight, spotty, and barking, 40s.; good sorts, 38s.; fair, 36s.; siftings, 32s.

**Bombay.**—One case fair small, 23s.; 2 cases middling, 30s.

**Persian Insoluble.**—Quite neglected; no bids made.

**Turkey Sorts.**—Pale and amber, fair part hard and dusty, 55s. and 54s.; brownish dusty, 47s. 6d.; picked, good, hard, clean, 62s. to 63s.

**Senegal.**—Barberry and Cape all bought in.

**Australian.**—Seven bags very good pale red frosted, dusty, sold at 33s. 6d.

**Gum Olibanum.**—Seven hundred and sixty-nine cases Bombay offered; 109 cases sold. Drop, good pale (two cases only), 32s. 6d.; garblings, good part blocky, 17s.; fair, 11s.; ordinary, 8s. 6d.; low barking, 8s. 6d. Siftings, fair, 11a. 6d. to 12a.; ordinary, 10s. 6d. Aden sorts, 73 barrels offered; 6 lib. fair dusty sold at 12a.

Late News.

**Chemists and the Early Closing Bill.**—At the sitting of the Select Committee of the House of Commons on Sir John Lubbock's Shops (Early Closing) Bill, on Wednesday, Mr. A. C. Wootton, editor of the Chemist and Druggist, said that Liverpool being one of the three towns selected as most likely to represent the interest of the drug trade in the United Kingdom generally on the subject of early closing, voting cards were sent out to 206 firms of chemists and druggists in that city, asking whether they approved or disapproved of the principle of the Bill before the committee, a copy of which was also forwarded for their consideration. Of the replies received 106 were in favour of the Bill, ten against it, and three were neutral. The replies from the two other towns, Birmingham and Brighton, were largely in favour of the Bill. He thought the provision permitting drugs to be sold for medicinal purposes after hours would meet any public inconvenience which might otherwise arise.

**Midland Pharmaceutical Association.**—A meeting of this Association was held at the Mason College on Thursday, the 25th ult.—Mr. Alfred Southall in the chair—when Mr. F. H. Alcock opened a discussion on the Renaissance of the Pharmacopoeia. As time, however, did not permit of an adequate consideration of the various points brought forward, it is hoped to resume the discussion at an early date.

**Company Business.**

**The Chemists' Co-operative Society, Limited.**—Capital, £500,000 in 100,000 7 per cent. cumulative preference shares, and 100,000 ordinary shares of £1 each. Objects, to carry on the business of wholesale, retail, manufacturing, and export chemists and druggists on the co-operative principle. The company has entered into a contract for acquiring 40 Establishments, the net profits from these in the current year are estimated to have amounted to £111,905, and has also agreed to purchase 36 other businesses, subject to the net profits being certified to be not less than £11,000 per annum, and it acquires certain leasehold premises. The purchase price is fixed at £122,500, payable as to £70,000 in cash and £52,500 in shares at the price of 21s. per share. There are now offered for subscription 75,000 preference and 75,000 ordinary shares at a premium of 1s. per share.

**Weston and Company, Limited.**—This company was registered with a capital of £20,000, in 21 shares, to carry on the business of chemists, druggists, drysalters, patent-medicine and proprietary-article manufacturers and vendors, mineral and aerated-water manufacturers and merchants, etc. The 1st, 2nd, 4th, etc., (after the 1st) premium (on the first premium share) are: C. T. Weston, chemist and druggist. Mrs. C. T. Weston, M. Weston, solicitor, B. Lambert, cashier, T. J. Clarke, chemist and druggist, William Wyles and Albert Wyles, boot-factors. Registered without articles of association.

**Personal and Trade Notes.**

Dr. W. H. Symons, F.I.C., Examiner of the Pharmaceutical Society, having successfully passed the Apothecaries' Hall, the Royal College of Surgeons, and the M.D. examinations, has also been successful in passing the recent Durham University Examination for the Diploma of Public Health.

The proprietor of the Crystal Palace John Bond's Gold Medal Marking Ink, announces that in future every purchaser of a 1s. bottle will be presented with an improved linen stretcher, in addition to the voucher for a rubber stamp.

The chemical works of Mr. Josiah Hardman at Melton, near Stockport-Trent, were on Monday night destroyed by fire. The damage is estimated at over £3000.

Mr. E. A. Holloway, of the London Drug Stores, Frest Street, Torquay, has taken the premises at 60, Union Street, lately in the hands of Messrs. Weight and Co., and will open them in the course of a few weeks, prior to which a large quantity of Bayliss and Co.'s stock, remaining from the late sale, will be sold by auction.
Exchange.

[Notices of books, apparatus, etc., for exchange, not exceeding thirty words including name and address, are inserted free, but must not partake of the nature of ordinary advertisements.]

WANTED.

PETROLEUM OIL PUMP, with Glass Measure wanted. State price and full particulars to Hulme and Co., Chemists, Oldham.

'British Medical Journal' for January 8, 1894. Full price will be given.—Pharmaceutical Journal office, 17, Bloomsbury Square, W.C.

'Pharmaceutical Journal,' February 23, 1894.—Full price will be paid by the Secretary, 17, Bloomsbury Square, London, W.C.

BOOK.—Landolt’s 'Text Book on the Polariscopes.'

—W. W. Wil1, 1, St. Agnes Place, S.E.

MICROSCOPIC OBJECTIVE 1 or f-inch, by good maker. State lowest price to 'Bond,' 77, Nether Edge Road, Sheffield.

OFFERED.

Pindar’s New Rotary Pill Coater and Sifter, cost 75s., equal to new; take 80s. cash.—Rudd, Pharmaceutical Chemist, Ripon.

LABEL CABINET.—Hold about 200 varieties, slips, etc., instantly found and taken; nothing to wear up or go wrong; greatest convenience to druggist. 8s. —W. Hindle, Chemist, Gorleston, Grt. Yarmouth.

BOOKS.—The Diseases of Women, by Dr. Graily Hewitt, 3rd Ed., 10s. 6d.; Allingham’s 'Diseases of the Rectum.' 7s. Both contain numerous engravings, and as new.—J. Allen, Chemist, Plymouth.

Terms for Advertisements in the Pharmaceutical Journal.

Advertisements of Assistants Wanted, Apprenticeships, For Sale, Partnerships, Businesses for Disposal, Businesses Wanted, and Premises to Let are charged as follows.—Fifty words or less, 8s. 6d. Each additional ten words, 6d. Advertisements of a general character are inserted at 4s. 6d. each for seven lines (50 words) or less, and each additional line of seven words, 6d.

Advertisers are requested to observe that late prepaid Advertisements received before 5 p.m. on Thursday of each week, are inserted on the last page of the 'Supplement.'

All Advertisements, except for the 'Exchange' column, must be sent to the Office, 5, Serle Street, W.C., where replies to prepaid Advertisements may be addressed, and will be re-directed free of charge.

Advertisements of Assistants seeking Engagements will be inserted Free of Charge, if not exceeding 30 words (inclusive of address), and if received before 10 a.m. on Thursday.

Postal Orders should be made payable at Lincoln’s Inn, W.C., to Street Bros. Cheques should be crossed "London Joint Stock Bank."

Late Advertisement.

Assistant Wanted.

WANTED at once, a Temporary Manager, to take charge for a month or so. Must be qualified, and preference would be given to one who has some knowledge of Postal (not telegraph) duties. W. F. C. Key, 6, Nugent Terr., Abercorn Place, St. John’s Wood.

Diary of the Week.

[Notices for insertion under this heading should reach the Editor on or before Wednesday.]

SATURDAY, MAY 4.

School of Pharmacy Students’ Association.

Botanising Excursion to Hadley Woods. Leave King’s Cross (suburban) for High Barnet at 1.44 p.m.

Pharmaceutical Cricket Club v. Hadley C.C., at High Barnet. Leave King’s Cross at 1.44 p.m.

MONDAY, MAY 6.

Society of Arts (Cantor Lectures), at 8 p.m.

"Recent American Methods and Appliances Employed in the Metallurgy of Copper, Lead, Gold, and Silver" (Third Lecture), by James Douglas.

Society of Chemical Industry (London Section), at 8 p.m.

"The use of Hot Air in Drying," by C. C. Hutchinson.

"The Estimation of Alkaline Salts in Fire Clay, Manures, etc.," by A. Cameron.

[From the London Gazette.]

James Morris and George Morris, carrying on business as Patent Medicine Vendors, at 33, West Street, Leicester, under the styles of Morris and Co. Debts will be paid and received by James Morris.

William Sanderson and Ralph Brown Annies, carrying on business as Wholesale Druggists, Sky Store, General and Provision Merchants, at Sandown and Cardiff. The business will be carried on by and under the name of Ralph B. Annies.
Pharmaceutical Journal.

FIFTY-FOURTH YEAR OF PUBLICATION.
A Weekly Record of Pharmacy and Allied Sciences.

The Official Organ of the PHARMACEUTICAL SOCIETY
of GREAT BRITAIN, and the oldest Journal
addressing Chemists and Druggists,
Circulating in the United Kingdom, France, Germany,
Austria, Italy, Russia, Switzerland, Canada, the
United States, South America, India,
Australasia, South Africa, etc.

Editorial Office: 77, BLOOMSBURY SQUARE, W.C.
Publishing and Advertising Office, 6, SERLE STREET, W.C.

PUBLISHED WEEKLY, PRICE FOURPENCE.
AN AVERAGE OF 7,000 COPIES PRINTED WEEKLY.
ANNUAL SUBSCRIPTION, INCLUDING POSTAGE, 10s. 6d.

In addition to being the sole periodical publishing full
and complete reports of the transactions of the Phar-
maceutical Society and of the British Pharmaceutical
Conference, the JOURNAL records the proceedings of phar-
maceutical and other scientific societies throughout
the country, and chronicles all important advances in phar-
macy and allied subjects in this country and abroad.
Reviews of new scientific and technical works form an
important feature in the JOURNAL, and its pages are also
open for the discussion of matters of importance to British
pharmacists generally, as well as for the purpose of sup-
plying special information desired by subscribers.

The JOURNAL is supplied from the Publishing Office,
5, Serle St., Lincoln's Inn, W.C., post free for twelve
months to any address throughout the world, on receipt
of remittance for Ten Shillings and Sixpence.

Special Issue of the Journal.

The PHARMACEUTICAL JOURNAL of May 26 will con-
tain a full report of the FIFTY-FOURTH ANNUAL MEETING
of the Pharmaceutical Society, the result of the
Election of Council
for the ensuing twelve months, and a Special Report of
the Annual Dinner. As this issue will therefore possess
a special interest to pharmacists, a copy will be sent to
Every Chemist in Business
in England and Wales, Scotland, and Ireland, whose
address can be ascertained. The number of copies sent
out on this occasion will exceed
11,000.
Advertisements for the Special Issue should be sent
without delay to the Publishing Office,
5, Serle Street, Lincoln's Inn, London, W.C.

Trade Notes.

THE SANITAS COMPANY (LIMITED) entertained some
two hundred members of the Sanitary Inspectors' Asso-
ciation at the works at Bethnal Green, on Friday,
April 28.

THE LIQUOR CARNIS Co. announce that many sug-
gestions have been received concerning the size of the neck
of their "Malt-Carnis" bottle, which is not considered
wide enough, it has been decided to put on the market a
distinct and new size to retail at 1s. 9d., the neck of the
bottle of which admits of a teaspoon.

Personal Notes.

PROFESSOR HUXLEY, who is but slowly recovering from
a severe illness, celebrated the seventieth anniversary
of his birthday on Saturday last.

Mr. T. H. W. IDRIS has been appointed a member of
the General Purposes Committee of the London County
Council.

Mr. Thomas Bateson, of Kendal, who is a candidate for
a seat on the Pharmaceutical Council at the pending
election, will be remembered as a candidate on two former
occasions, when he received a large number of votes.

Mr. A. S. Campkin, of Cambridge, another candidate,
occupied the last place on the list at the last election.

Mr. Octavius Corder, of Norwich, appears as a candi-
date for the first time, having for a number of years served
on the Board of Examiners for England and Wales, from
which position he retired last year. Mr. Corder was
President of the British Pharmaceutical Conference at
the Nottingham Meeting in 1898.

Mr. A. L. Savory, of New Bond Street, W., a member
of the well-known firm of Savory and Moore, has not
formerly accepted nomination for office.

Mr. G. S. V. Wills, of the Westminster College of Phar-
macy, stood for election some years ago, but was not
returned.

Partnerships Dissolved.

[From the London Gazette.]

Jacob Humphries and George Alexander Weall, Manu-
facturing and Wholesale Chemists, Druggists, and Dry-
sellers at Adolphus Street, Bradford, under the style of
Humphries and Co. Debts will be paid and received by
G. A. Weall, who will continue the business on his own
account.

William John Goodwin, Harry Orton Goodwin, and
Harold Goodwin, formerly carrying on business under
the style of the Church Street Attered Water Co.

Kilner Brothers, Glass Bottle Manufacturers at
Thornhill Lees and Conisborough, Yorks, and King's
Cross, London, so far as regards Tom Kilner.
Modern Pharmaceutical Industries.

THE MANUFACTURE OF CASTOR OIL.

A DESCRIPTION OF MITCHELL'S COLD PROCESS.

The manufacture of castor oil not having been hitherto attempted in this country, it has been thought that some description of the process employed by the British Castor Co., Ltd., would be of interest to readers of the Journal.

The system hitherto in use at the centres of this industry involves, first of all, the separation of the husks from the kernels, which are then heated and moulded into cakes and placed in horsehair bags or cloths and submitted to pressure, which is almost invariably obtained by manual power in India. In Marseilles and other centres of Europe where castor oil is manufactured, hydraulic pressure is usually applied. In the case of East Indian oil, the total oil taken from the seed is usually extracted at one operation; but where hydraulic pressure is employed it is found more economical to press twice, and by this means extract a larger percentage of oil from the seed. The Calcutta mace from castor crushing contains about 20 per cent. of oil, whereas by the other systems it is considerably less than half that amount. This mode of manufacture has many objectionable features, being complicated and unnecessarily expensive, and most injurious as regards the quality of both the oil and the cake so produced.

The system adopted by the British Castor Co., Ltd., at their works, which are situated in Elenton Street, London, S.E., has been introduced by their consulting engineer, who has invented and patented most of the apparatus employed. Gunnerat seed is exclusively employed for the preparation, both of the medicinal and the lubricating oils, so as to ensure a uniform product, as it is the only variety which can readily be obtained free from admixture.

The first floor of the building is used as a granary, and here the seed is carefully sifted, so as to get rid of any extraneous matter. It is then loaded into a movable hopper which forms part of the larger horizontal hydraulic press situated on the ground floor. When the press boxes are open the seed is discharged through the aperture at the bottom of the hopper, and fills the boxes. A water-motor then operates the press, and then the oil is expressed, falling upon a movable plate and into drains provided for its reception along each side of the press. From these sources it flows into a linen strainer, which separates the crushed seeds which have escaped from the press, and then into an adjacent tank. Here, when it reaches a certain level, the stopcock of a vacuum pipe in connection is opened, and the oil is immediately drawn through a system of pipes into a cylinder on the first floor in another part of the building, whence it passes down into the first filter, which takes out all mechanical impurities. Thence it is drawn into another cylinder adjacent to the first, one being empty while the other is full, and so on. At this stage it may be noticed that the oil is perfectly clear and bright. However, in order to get rid of any mechanical impurities it passes from the second cylinder into a second filter, whence it is drawn into the bottling machine. As a final precaution, it is again filtered before being run into the bottle. This apparatus, which has been patented by Mr. Mitchell, is admirably adapted for the purpose, and, as a vacuum is formed in the bottle while it is being filled, the oil and the heated bottles are at once detected. The temperature both of the filling and bottling rooms is kept uniform day and night.

It may here be remarked that the system of filtration is throughout entirely mechanical, no chemicals being employed in any part of the process. In the case of the oil, these cloths, of a special kind of twill are arranged in each filter. The plant has been erected about four months only, and medicinal oil is expressed during the first half of the week, the press being afterwards used for the extraction of lubricating oil from the residue; but from the press forward the two varieties of oil pass through their respective systems of pipes and refining plant so as to avoid any possible contact between them. Shortly, however, the two varieties of oil will be made continuously, a separate press being provided for each. The press takes a charge of 3 cwt. of seeded castor at each operation, the liquid oil expressed from the press being cold drawn; the temperature of the press-room averaging 45° F. This is of interest, in view of the fact that very little, if any, of the so-called "cold drawn" castor oil at present on the market is properly so termed. The oil, in all its stages of manufacture, has a simple bland taste, resembling olive or almond oil, in marked contrast to the nauseous taste usually associated with it. The press takes a charge of 3 cwt. of seed at each operation, the largest press expressing the medicinal oil being about seventeen minutes. An important feature of this system of vacuum filtration is that from the time the oil leaves the collecting tank until bottled it is never exposed to the natural moisture of the oil is dispersed mechanically.

After the seed has undergone the first pressure, whereby half of the available 44 per cent. of oil has been collected for medicinal purposes, the residual cake is again subjected to the same treatment. This takes out an additional 10 per cent. of oil, finally leaving about 5 per cent. in the marc. The second product goes through a similar process to the first, except that it is only filtered once, and that three instead of four cloths are employed for the medicinal oil fraction. It is used exclusively for lubricating purposes, as a matter of fact closely resembles the medicinal oil, but has a slightly nauseous taste. The marc left after the second extraction is at present entirely used for horticultural purposes under the name of "Foodite." Analysis shows it to contain 77-29 per cent. of nitrogen, equivalent to 8.34 per cent. of ammonia.

Mr. Mitchell was engaged in the manufacture of castor oil in India for some twelve years, and the process was now employed by him exclusively the best result of his experience in the different oil-producing centres. Calcutta alone there are more than 200 mills engaged in crushing castor oil seed, but the system there employed, as already explained, is not yet subject to submitting it to pressure. However, a mill is being erected there in which Mitchell's process has been adopted. The advantages claimed for crushing the whole seed are that the cake is much less costly, and that there is no danger of internal pressure, such as is liable to occur when the kernels only are submitted to pressure.

Obviously this system of extraction is applicable to many other seeds besides castor. In fact it has been tried with extremely satisfactory results, and in this instance, after about 27 per cent. of oil had been extracted by cold pressure, the seed was but little altered in appearance, and would doubtless be very useful in the state for cattle food, the expense of making it into oil being unnecessary. Besides this, several purposes for which it could with advantage be used pharmacologically, suggest themselves. The most important economic use of the seed, however, is as a source of oil, and the extraction of this is clearly and simply demonstrated at the works of the British Castor Co., Ltd.

MICROBES AND FOOD.—Now an editor of a leading medical journal comes out with a note of warning in the use of bread and butter. It seems the germ is there. Some years ago we began rolling off articles of diet because the bacteriologist discovered microbes. He kept on discovering, and we kept on rolling, till we got down to bread and butter. Now we have some microbes. The grave dilemma confronted us; stop off more and say, eat germs. We have begun to eat germs. We find that good diet; our weight is increasing, disease resists, along with the stale microbes are the beneficiaries, the happy bacteria that eat germs. Take them for breakfast, get all to be fed, and there is no need of avoiding them. —"Patent Medicines Journal."
Company Business.

DAVIES AND EVANS, LIMITED.—Registered by Barnard, Regge, and Jopp, 7, St. Mildred's Court, Poslsey, E.C., with a capital of £100,000 in 21 shares. Object: to adopt and carry into effect any agreement expressed to be made between J. Brillmayer of the part, and this company of the other part, and generally, to carry on business as oil, colour, and Italian warehousing, hardware, wine, spirit and beer merchants, warehousemen, manufacturers of and dealers in aerated and mineral waters, drysalter and picklers, manufacturers of and dealers in glass, china, earthenware, tea, sugar, coffee, tobacco, jams, preserves, patent medicines, disinfectants, brushes, baskets, bags, etc. The directors are to be elected by the signatories. Qualification, £250. Qualification of share-holders £500. Remuneration: Chairman, £400 per annum; ordinary directors, £200 per annum each.—Financial News.

QUELINE BITTERS MANUFACTURING COMPANY, LIMITED.—The Quiline Bitters Manufacturing Company, Limited, Llandudno, have just published their seventh annual report and balance-sheet. From these, it appears that the net profit for the year to March 31 amounts to £1012 13s. 6d., which, together with the balance of £534 10s. 8d., make a total of £1557 4s. 2d. An interim dividend at the rate of 5 per cent. per annum was paid in October, 1893, amounting to £443 15s. 9d., and the interest on calls paid in advance amounted to £55 15s. 3d. From the balance of £1021 10s. 2d., the directors recommend a dividend at the rate of 5 per cent. per annum for the six months ending March 31.

WAKEFIELD'S NATURAL HEALTH MEDICATION COMPANY, LIMITED.—Registered with a capital of £2500 in 21 shares. Object: to enter into an agreement with William Wakefield and J. Linfoot, both of Leeds, Yorkshire, for the acquisition of the Under-taking of the Psychopathic Dispensary, now carried on at 78, North Street, Leeds, and to carry on the same. Managing director, W. Wakefield. Registered office, 78, North Street, Leeds.

CHARLES MIDGELEY, LIMITED.—Registered with a capital of £3000 in 21 shares. Object: to carry on the business of wholesale and retail chemists and druggists, dentists, etc., at 23, St. Ann's Square, Manchester, or elsewhere. The directors are C. Midgeley, F. Murdock, and H. O'Hanlon. Qualification not specified. Remuneration to be fixed by the company.

CROAD AND BROWN, LIMITED.—Registered with a capital of £20,000 in 21 shares. Object: to acquire the business of crushers and grinders of linseed, cottonseed, etc., and as oil, coal, and manure merchants, hitherto carried on at Bridgewater under the style of Croad and Brown, and to develop and extend the same. Registered office: The Docks, Bridgewater, Somersetshire.

FRAZER JOSEPH WATER COMPANY, LIMITED.—Registered by John Hart, 22, Great Winchester Street, E.C., with a capital of £6000 in 21 shares. Object: to acquire the business now carried on by Francis Joseph Water Co., to acquire mineral springs, to manufacture, sell, and deal in mineral and mineralated waters, etc.

MEDICAL HERALDISTS' DEFENCE UNION, LIMITED.—Registered by A. M. Wilson, County Court Chambers, Bank Street, Sheffield, as a guarantee company, with a membership of 500, each of whom is liable for the sum of £2 in the event of winding up. Object: to support and protect the character and interests of medical herbalists practicing in the United Kingdom, and to promote honourable practice, and devise means whereby the public may be enabled to distinguish between the legitimate practice of medical herbalism and the practices of those who simply trade on its honoured name to its detriment and injury. The control of the business lies in a council, consisting of a president, three vice-presidents, treasurer, secretary, and a committee of four duly-qualified members of the union, to be elected annually.

MEDICAL ELECTRICAL INSTITUTE.—This company was formed last October to take over the business hitherto carried on by the Medical Battery Company, Limited, which went into liquidation in November, 1893. The capital was agreed at £75,000, of which, £50,000 ordinary shares were to be issued as fully paid to the shareholders of the old company, and £25,000 preference shares were to be issued to the creditors of that company. At the meeting of the creditors and contributories now held before Mr. C. J. Stewart, the Official Receiver, no resolution was moved for the appointment of a liquidator, and the matter was left in the hands of the chairman, to be wound up in the usual manner. The accounts filed under the proceedings showed unsecured debts £1363, other liabilities £648, loans on debenture bonds £9440, and preferential claims £1156. The assets are valued at £6000, and are covered by the debenture bonds, the deficiency to the creditors being £6630. In reply to a creditor, the chairman said there was no prospect of any dividend being paid on the unsecured claims, which included a sum of £200 in respect of directors fees. Nothing whatever has been received by the directors.

FERRY'S POWDERS, LIMITED.—This company was registered with a capital of £20,000, in 21 shares (£10,000, 10s. per cent. cumulative preference, and 100 founders'), to purchase, or otherwise acquire, the business of Thomas Child, at 22, Wellington Road, Leeds, carried on under the style of "Ferry & Company," dealing in and selling two patent or proprietary medicines, known as "Ferry's teething-powders for children" and "Ferry's pills," and a wholesale and retail chemist and druggist and dentist, and also to enter into an agreement with the said Thomas Child.

HALVIA, LIMITED.—Registered with a capital of £10,000 in 21 shares. Object: to carry on business as chemists and druggists generally, and to enter into an agreement, made April 22, with J. B. Halterow, to manufacture and deal in a certain registered medical preparation known as "Kest Halver," also to become elected by the signatories to the memorandum of association. Remuneration to be fixed by the company.

MORPHINE IN SOOTHING SYRUP.—Certain preparations (sic) known as soothing syrups, run their unfortunate course apparently with the ambition of drawing strong observations from the mouths of coroners and juries, whereas it is plain they should attend wholly and solely to the mouths, etc., of little suffering babies. Hence their misfortune. Not a word can be said here in defence of a soothing syrup containing eight times the quantity of morphine stated, which recently killed a child Worcesters. In the case quoted the maker's name did not transpire at the coroner's inquest, but until the contrary is proved, it certainly looks like the work of a clumsy substitutor.—Patent Medicines Journal.
SUPPLEMENT TO THE PHARMACEUTICAL JOURNAL AND TRANSACTIONS.

[May 11, 1866.

1st, 5d. is in some cases asked. Lemon-grass: Namely 1 1/4. Peppermint: H. G. Hotchkiss' oil is dull of sale at 2s. 6d. Japanese oil contains menthol, which is steady at 8s. 6d., with bromidised at £6. 6d.

Oils (fixed) and Spirits.—Lime-seed: Very firm, and advanced advances have been paid, the closing quotation being £20 12s. 6d. In barrels on the spot. Cotton: Lower; £17 15s. to £18 10s. is the present quotation for refined oil, according to brand. Coco-nut, easier. Ceylon is quoted at £22 15s., Cochín £24 15s., Mauritius £28 1s. 6d. Rice: Frimmer. Refined oils worth £22 10s. to £23 15s. Turpentine: Lower and dull of sale. American spirit is in no style, 10d. on the spot. Petroleum quiet. American oil is quoted at 6d., Water white 8d., and Russian 5fd.

Oil (Cod-liver).—Much firmer, and holders are now asking 10s. to 10s. 6d. per barrel of 25 gallons for fine new non-congealing oil.

Opium.—Persian continues in good demand, and holders are firm. During the week 12s. 6d. has been paid for quality. Turkey opium remains quiet, soft shipping descriptions being quoted nominally at 11s. 9d. to 12s., best druggists', 10s. 6d. to 10s. 11d., seconds ditto, 9s. 6d. to 9s. 10d.

Peru (Balsam).—Selling privately 9d. 6d. c.i.f. terms. Quinine.—Quiet, but steady, and no sales of importance were occurred. B. & S. and Brunvick are quoted at 1s. 6d.

Santonin.—The present price is 5s. 4d. per lb.

Shellac.—Sales privately have been but steady rates. At the auctions on the 7th inst., no business AC., with 10s. paid for glassy unworked. Button was done in Second Orange. Garnet sold at 10s. 6d. for worked Ceylon £11 11s., ordinary ditto, 10s. 6d., and cayide wide at 11s. 6d.

Soy.—Steady. Fair China sells at 1s.

Tolu (Balsam).—Steady. Little business has been done privately, holders asking 1s. 6d. per lb.

LAST WEEK'S DRUG SALES.

The fortnightly drug sales last week being so heavy as to necessitate an adjournment, were completed on Friday, the 8th inst., when the following prices were realised:

Aloe.—Curacao: The moderate amount offered sold freely at fully steady rates. Prices—good bright liver, 41s. to 40s.; dark to fair, part Caspey, 11s. 6d. to 13s. 6d. Barbados quiet. Five boxes good liver, mostly or less, exported sold at steady rates. Ceylon-Muore: Fine medium, fair to good bright, sold at 21s. 6d. to 24s. Socotrine was all bought in.

Ammoniacum.—Nine bags small, slightly blocky, seedy gum sold at 29s.

Asafetida.—Dull of sale. Of a total of 750 cases offered, 85 sold at the following prices: Fine free medium pale almonds, partly blocky, 25s. 6d.; good hard pinkish, slightly blocky, 20s. to 25s.; ditto somewhat earthy, partly grey and soft, 60s. to 65s.; down to 20s. for low blocky.

Benzoin on the whole fairly steady, but the prices obtained were irregular. 51am. Dull of sale; sales sold at 50s. Sumatra, bold pale almonds, per cent, sold at £2 12s. to £2 17s. 6d. Palembang, very ordinary fourths sold at 19s.

Buchu.—Very steady, 15 bags of good bright round green leaves, sold at 35s. to 35½d.

Calumbra Root.—One hundred bags of very small sorts, somewhat wormy, sold at 7s. to 7s. 8d.

Cannelka Alba.—Ten bales of good quality, small to bold bark, sold at 24s.

Cardamoms.—Prices were generally somewhat easier, but kept steady 21s. Ceylon—Medium, fine medium to bold pale, 2s. 11d. to 3s. 8d.; good medium, 2s. 9d. to 2s. 11d.; medium, dull to pale, 2s. 6d. to 2s. 8d.; small ditto, 1s. 9d. to 1s. 11d., down to 1s. 2d. Ceylon-

Malabar: Bold to medium, pale, 1s. 10d.; small to medium, brownish, 1s. 6d. to 1s. 8d., down to 1s. 2d. Tellicherry: Fair brown, 1s. 9d. Seed, 1s. 11d. to 2s. 1d.

Cascara.—Sixty-four bales of ordinary small brown chips sold at 22s. 6d. to 37s. 6d.

Cuttlefish.—Ten cauls fairly quality sold at 1½d.

Dragons Blood.—Two cases fair lump, partly dull Singapore gum sold at £8 15s.

Elemi Gum.—In good demand. Thirty-four cases sold at 81s. for good white gum, down to 36s. 6d. for ordinary yellowish and discoloured.

Gamboge.—Easier. Seventeen cases sold; medium pipe of fair fracture, partly drossy and slightly damp, at £8 12s. 6d.; dull to bright pickings, £2 8s.

Honey, Jamaica.—Sold freely at 22s. to 26s., with 1½d. paid for dirty, somewhat thick.

Ippecuana.—Rio (New Granada), in fair demand and the ordinary grades of root fetched 2d. to 2d. 6d. more per lb. than at the last sales. Prices:—Good bold plug pipe of 15s. 9d. to 16s. 1d.; thin fair, 2s. 4d. to 2s. 5d. Cartagena (Columbia), good light first class damaged, 3s. 6d. down to 2s. 10d. for ordinary third class ditto.

Rubarb.—Sold at fully steady rates. Ceylon, fair small flat sold at 10d. to 11½d.; good small round 11½d. to 12½d. High dried medium, 10d. Shenzenii, medium flat, three fourths pinky fracture, 1s. 10d.

Sarsaparilla.—Jamaica: Pale native sold at 8½d.; damaged, 7d. Lima Jamaica: Good bright, second to first class damaged, 8d. to 11½d. Honduras, 8½d. to 1s.; fair damaged ditto, 11½d.

Senia.—Very firm. Good bold green Tinoscella have sold at 8½d. to 9d.; ordinary to fair yellowish, 9d. to 3½d.

Wax (Bees).—Jamaica: Sold at £8 7s. 6d. to £21 15s. for fair to good yellow. Madagascar: Very firm. Good bright sold at £7 7s. 6d. to £7 10s. 0d.; ordinary dark, £7 15s. Australian: Four cases sold at £7 7s. 6d. to £7 17s. 6d. Mozambique: Mixed yellow and grey sold at £21 17s. 6d.

Terms for Subscription to the Pharmaceutical Journal.

The Pharmaceutical Journal circulates amongst Pharmacists in Great Britain and Ireland, France, Germany, Austria, Italy, Russia, Canada, the United States, South America, India, Australasia, South Africa, etc., etc., and is therefore specially adapted for all Advertisements to the Drug Trade at home and abroad. The average number of copies printed weekly is 7,000.

The Annual Subscription, commencing at any time and including postage to any address throughout the world, is 10s. 6d.

For the convenience of subscribers, a table showing the sums payable in Foreign Currencies for one year's subscription (including postage) is appended:

Market Report.

Chemicals and Drugs.

[The quotations here given are in all cases the lowest net price for bulk quantities, and often the articles noted have to be sorted in order to suit the requirements of the pharmacist. It is important that this should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.]

The Chemical Market.

Thursday, May 9, 1895.

The most important points of interest in the chemical market during the past week are briefly as follows:— tartaric acid remains very firmly held, whilst the prices of cream of tartar have been further advanced. Sulphate of ammonia has fluctuated somewhat, but at the close is steady, and advanced prices are probable. Full details of particulars of interest are given below:

Acid, Citric.—The demand has been fairly steady about any alteration in the quotation. Prices are still at 1s. 1d. to 1s. 2d. per lb., according to quality.

Acid, Oxalic.—Has been selling steadily at the last quotation of 3/-d. net ex rails. 

Acid, Tartaric.—A very firm market at fully steady rates. English manufacturers quote at 11d., whilst most brands of acid, both in powder and crystals, are quoted at 10s. 6d. to 11s. 6d. per lb.

Ammonia Salt.—The market generally is steady, and advanced prices for sulphate are probable. Carbonate changed at 3/-d. to 3/-d. Liquor remains last week's quotation of 3d. to 3/-d. Sal ammoniac quiet at the lesser rates of 3s., for first quality, with seconds at 3/-d. Sulphate: Earlier in the week it touched £3 7s. 6d., but the close in the market is very firm, and 27 1/2s. has been old for grey 24 per cent.

Antimony.—Still falling, and the current quotation is now 1s. 1d. per lb.

Arsene.—Are unaltered. Sales of American have been steady at the steady rate of 40s., with pots at 32s.

Arsenic.—The scarcity continues, and best powdered grade is still quoted at 15s.

Benzole.—Fifty per cent is unaltered, the quotation being 1s. 60d. to 1s. 6d. per lb. 

Bichromate of Potash.—The steady demand continues at advanced rates. On the spot the quotation remains at £7 10s. 6d., and in Liverpool at £7 2s. 5d. f.o.b., or on rails, the price.

Borax.—A quiet market at unaltered rates. Syndicate rates are 20s. for crystals and 32s. for powder, but in small hand orders it is quoted at 1s. 6d. less.

Copper Sulphate.—Dull of sale. The best brands are generally quoted at £5 10s. 6d., with others at prices ranging upwards from £4 15s.

Cream of Tartar.—A very firm market at advanced rates. German makers have advanced the price of 50 lbs. from 60s. to 70s. on the spot, whilst 65s. is paid best white French crystals.

Diacetonic Acid.—Unaltered. Quantities up to 25 lbs. are quoted at 13s. 9d. per lb.; 25 lbs. to 50 lbs., 12s. 6d. per lb.; 50 lbs. to 100 lbs., 11s. 9d. per lb.; and 100 lbs. or over, 11s. 6d. per lb.

Herbal Drugs. —Importers' prices remain whilst in second hand orders it is quoted at 32s. 6d. per lb. 

Morphine.—Again lower, in sympathy with the other opium alkaloids, the current quotation now being 4s. 6d. per lb. for 1000 oz. lots, 4s. 6d. for smaller wholesale quantities. 

Salpetre—Steady. Bengal 3½ to 5 per cent. is unaltered at 17s. 6d. on the spot, whilst for arrival May to June, sales have been made at 17s. British refined is worth 22s. 6d. to 23s. 6d.

Soda Compounds.—Unaltered. Bichromate, 2s. 6d. London. Caustic, 79 per cent., £2, with 60 per cent., £1 less. Crystals, 38s. Hypomuri phosphate, 26s. 5d. in 1 cwt. bags (Liverpool).

The Drug Market.

Thursday, May 9, 1895.

The most interesting feature in this week's Drug Market has been the continued advance in crude camphor, which has advanced by leaps and bounds since our last report. The bulk of the business has been in the Chinese variety, and prices are still continually on the rise. Full details are given below:—

Caffeine.—Famine prices are still paid for this in second hands, whenever offered. For small lots, 27s. has been paid during the week, for spot delivery.

Camphor (Crude).—As above mentioned, the prices have been enormously advanced this week, and continue to rise. The closing quotation given last week for China for arrival was 110s. to 112s. 6d., c.i.f., April to June shipment. Since then the principal items have been 4000 cases at 107s. 6d. to 112s. 6d., c.i.f., and 1500 cases at 117s. 6d. to 118s. 6d., c.i.f., April to June shipment. Yesterday 137s. 6d., c.i.f., was paid, and 140s. 6d., c.i.f., asked. Arrival sales of 800 parcels of Japan near at hand, were made on Monday at 132s. 6d., and April to June shipment, 127s. 6d., c.i,f., but since then the prices have advanced proportionately to Chinese, and it closes at 137s. 6d., c.i.f.

Camphor (Refined).—A move has at last been made by the English and German refiners, the prices being advanced 2d. per lb. on the 7th inst. The current quotations are now:—1s. 7d. for bells and flowers in 10 cwt. lots, with squares at proportionate rates.

Cloves.—Quiet. Quotations for Zanzibar are more or less nominal, and remain easy at 2½d. for June to August delivery.

Coca.—A good demand exists for good quality leaves, both Truxilio and Ceylon, which have been selling freely privately, at 1s. 2d. to 1s. 3d. for Ceylon leaves, with 10d. to 1s. paid for fine broken Truxilio leaves of good green colour.

Cocaine.—Quotations remain unchanged as given in our last report.

Codine.—The manufacturers have again lowered the price by 6d. per oz., and the current quotations are now 10s. 3d. to 10s. 9d., according to quantity and brand.

Colocynthis.—Very firmly held, and the scarcity of the better qualities continues. Good pale Turkish apple sells readily privately at 1s. 10d., and 2s. is now asked.

Copaiba.—Little business has been done privately, but it is very steady, good Maranhao being worth 1s. 6d. to 1s. 10d., whilst for bright balsam, of Para character, 1s. 7d. is asked.

Ipecacuanha.—Sales privately of Cathaerga root have been made at the steady rate of 3s. 6d. for first-class damaged root.

Jalap.—There is a firm tendency in the market, and holders ask 11d. for good Fera Cross root. A considerable amount will be brought forward at the next drug sales.

Menthol.—Rather quiet; 5s. 6d. would be accepted on the spot. For delivery the quotation is 14s. for good white dry crystals.

Morphine.—Again lower, in sympathy with the other opium alkaloids, the current quotation now being 4s. 6d. per lb. for 1000 oz. lots, 4s. 6d. for smaller wholesale quantities. 

Crystals: 2s. per oz. more.

Oils (Essential).—Star anise: No change has occurred, and 6s. 5d. has been paid during the week on the spot. Nominally the quotation remains at 6s. 6d. Cassia: A shade easier, 4s. 9d. to 5s. being asked on the spot for 75 to 90 per cent. oil. For arrival it is quoted at 4s. 7d. to 4s. 8d., c.i.f. terms. Citronella: Remains very steady; 1s. 2d. has been paid on the spot during the week, and
Exchange.

[Notices of books, apparatus, etc., for exchange, not exceeding thirty words including name and address, are inserted free in this column. They should bear post-cards, addressed 'Editorial Department, 17, Bloombury Square, W.C.' and must not partake of the nature of ordinary advertisements.]

WANTED.

'PHARMACUTICAL JOURNAL,' February 23, 1895.—Full price will be paid by the Secretary, 17, Bloombury Square, London, W.C.

OFFERED.

'CHEMIST AND DRUGGIST,' 8½ years (unbound), and 3 years bound, only one number missing. 18 year British and Colonial Druggist, four numbers missing. Offered wanted.—Bircham, Chemist, Lincoln.

BOOKS AND APPARATUS.—Attfield, Ewennis 'Chemistry,' 'B.P. and Additions,' Muter's 'Chemistry,' Muter's apparatus, cost 12s. 6d.; half published price, or £1 lot. Splendid condition.—Stack, 40, Broadway, Kettering.

Marriage.

DAND—HALL.—At Queen's Road Presbyterian Church, on the 2nd inst. (by licence by the Rev. John Tadhope), Arthur, youngest son of the late H. R. Dand, Wigton, Cumberland, to Sallie, third daughter of William Hall, Anfield, Liverpool, and Mount Pleasant, Loch Maben, N.B.

New Books and New Editions.

[Publishers are invited to forward full particulars of new publications, including price.]

DIRECTIONS FOR LABORATORY WORK IN BACTERIOLOGY. B. F. C. Now, Sc.D., M.D. (George Wahr, Michigan, U.S.A.)

OBJECT LESSONS IN BOTANY. By E. Snegurov. (Jarrold and Sons, London.)

LABORATORY GUIDE FOR THE BACTERIOLOGIST. By L. Frothingham, M.D.V., 60c. (W. B. Saunders, Philadelphia, U.S.A.)

DIE PRAXIS DES CHEMIKERS. By Dr. F. Elsner, Parts 4, 5, and 6. M. 1.25 each. (Leopold Voss, Hamburg and Leipzig.)

DIATHERAPIE FUR AERZEIT UND STUDIENDE. By Dr. F. Schilling. (J. F. Bergmann, Wiesbaden.)

Late Advertisements.

ASSISTANTS WANTED.

JUNIOR. Age about 21. Must be a good Dispenser and accustomed to a good Retail. Apply, personally, between 9 and 11 a.m. THOMAS GREENWICH, 26, New St., Dorset Sq., N.W.

AN energetic ASSISTANT. Must be well up in his business. Apply, stating age, salary required, photo, and full particulars, E. C. ASHFORD, Gold St., Northampton.

Diary of the Week.

[Notices for insertion under this heading should reach the Editor on or before Wednesday.]

SATURDAY, MAY 11.

Pharmaceutical Cricket Club v. St. Margaret's, at Twickenham. Train from Waterloo, 6.45, ar. 2.15. School of Pharmacy Students' Association.

Botanical Excursion to Hondon. Leave King's Cross (Metropolitan) 3.2 p.m. (Midland Train).

MONDAY, MAY 13.

Society of Arts (Canter Lectures), at 2 p.m. Recent American Methods and Appliances Employed in the Metallurgy of Copper, Lead, Gold, and Silver (Fourth Lecture), by James Douglas. Royal Geographical Society, at 8.30 p.m. A Journey on the Upper Euphrates, by D. G. Hogarth, Esq.

Journeys in the Peninsula of Baluchistan," by J. L. Myres, Esq.

TUESDAY, MAY 14.

Royal Institution of Great Britain, at 3 p.m. Thirty Years' Progress in Biological Science, by Professor E. Ray Lankester. Royal Photographic Society, at 8 p.m. The Cyclograph (Illustrated), by A. H. Smith. The Changes that Platinum Prints are liable to, by Chapman Jones.

Royal Colonial Institute, at 8 p.m. Ordinary Meeting. Institution of Civil Engineers, at 8 p.m. Ordinary Meeting. Edinburgh District Chemists' Trade Association, at 9 p.m. Annual Meeting. Election of Office Bearers, etc.

WEDNESDAY, MAY 15.

Royal Microscopical Society, at 8 p.m. On the Anatomy of Nyclostomus ovatus," by W. C. Boonanet. A New Microtome for Cutting," by Dr. A. Buse. Some Details of the First Nuclear Division in the Pollen-Mother-Cells of Lilium martagon, etc., by Miss Ethel Sargent.

Western Chemists' Association (of London), at 8 p.m. Discussion on the Present Phase of the Patent Law.

THURSDAY, MAY 16.

FRIDAY, MAY 17.

Royal Institution of Great Britain, at 9 p.m. Robert Louis Stevenson," by Professor W. Rayleigh. Edinburgh Pharmacy Athletic Club, at 7 p.m. The Swimming Section of above Club will meet a Corporation Bath to decide a four lengths' handicap race for two prizes. Entries to be sent to P. Walsh, 53, North Bridge, not later than Wednesday 15th inst.

SATURDAY, MAY 18.

Pharmaceutical Journal.

Fifty-Fourth Year of Publication.
A Weekly Record of Pharmacy and Allied Sciences.

The oldest Journal addressing Pharmacists.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australasia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.
Publishing and Advertising Office, 5, SERLE STREET, W.C.

PUBLISHED WEEKLY. PRICE FOURPENCE.
AN AVERAGE OF 7,000 COPIES PRINTED WEEKLY.
ANNUAL SUBSCRIPTION, INCLUDING POSTAGE, 10s. 6d.

In addition to being the sole periodical publishing full and complete reports of the transactions of the Pharmaceutical Society and of the British Pharmaceutical Conference, the JOURNAL records the proceedings of pharmaceutical and other scientific societies throughout the country, and chronicles all important advances in pharmacy and allied subjects in this country and abroad. Reviews of new scientific and technical works form an important feature in the JOURNAL, and its pages are also open for the discussion of matters of importance to British pharmacists generally, as well as for the purpose of supplying special information desired by subscribers.

The JOURNAL is supplied from the Publishing Office, 5, Serle St., Lincoln's Inn, W.C., post free for twelve months to any address throughout the world, on receipt of remittance for Ten Shillings and Sixpence.

Special Issue of the Journal.

The Pharmaceutical Journal for next week will contain a full report of the FIFTY-FOURTH ANNUAL MEETING of the Pharmaceutical Society, the result of the Election of Council for the ensuing twelve months, and a Special Report of the Annual Dinner. The Supplement of the same issue will be enlarged and contain a special article on Photographic Matters, as affecting chemists and druggists, together with photographic formulae, etc. A copy of the JOURNAL will be sent to Every Chemist in Business in England and Wales, Scotland, and Ireland, whose address can be ascertained, as well as to others interested in pharmacy. The number of copies sent out on this occasion will exceed 11,000.

Advertisements for the Special Issue should be sent without delay to the Publishing Office, 5, Serle Street, Lincoln's Inn, London, W.C.

Trade Notes.

The Chemists' AERATED AND MINERAL WATERS Association, Limited, supplies its products through chemists only, and up to the present 3000 have joined the Association.

The Liquor Carnis Co., 50, Holborn Viaduct, E.C., offers a new preparation called "Shepperson's Meat Juice," described as "a preparation of beef juice which has its albumin in a perfectly raw condition, rich in nutriment and extractives, and one that is free of direct absorption." Miniature samples are supplied for physicians, and two ounce bottles are retailed at 1s. 6d. each.

Bronchi-Fume is the registered title of a remedy for asthma and bronchial affections generally, prepared by Mr. W. A. Manning, Wylde Green, near Birmingham. The powder appears to contain oxalate, stramonium, and other ingredients, the fumes from which have a beneficial effect in diseases of the respiratory organs.

Personal Notes.

Mr. Francis Galton, F.R.S., is to receive the honorary degree of Doctor of Science at Cambridge.

Mr. F. W. Short, Assistant to Professor Atfield, and Secretary to the School of Pharmacy, will shortly take up the appointment of chemist to Messrs. W. J. Bush and Co.

Professor J. Reynolds Green, M.A., Sc.D., Dean of the School of Pharmacy, is one of the selected candidates for admission to the Royal Society.

Dr. P. Dangare has been appointed Professor of Botany to the Faculty of Sciences at Poitiers.

Mr. E. J. Millard has been elected a Fellow of the Royal Microscopical Society.

Mr. Thomas Greenish, who has just retired from the Pharmaceutical Council, has left England upon a visit to Malta for the benefit of his health.

Mr. S. W. Fairchild, of the firm of Fairchild Bros., and Foster, manufacturing chemists, New York, and President of the New York College of Pharmacy, is at present in England.

Mr. Thomas Tyler (of Thomas Tyler and Co., Stratford), has been nominated President of the Society of Chemical Industry. He was the first metropolitian secretary, fourteen years ago, and succeeded Mr. David Howard as Chairman of the London section.

M. Villiers has been appointed to the newly-created chair of analytical chemistry at the Paris Ecole de Pharmacie.

Prof. Guignard, of the same school, has been nominated Chevalier of the Legion of Honour.
MARKET REPORT.

Chemicals and Drugs.

[The quotations here given are in all cases the lowest net cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the pharmacist. It is important that this should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.]

THE CHEMICAL MARKET.

THURSDAY, MAY 16, 1895.

There have been several changes of interest in the chemical market since our last report. Tartrate is still very firm, and prices have been further advanced, whilst cream of tartar has also been a very steady market at higher rates. Sulphate of ammonia has been steadily rising, and is likely to continue to do so. Importers of quicksilver have raised their prices, and this movement has been followed by a similar advance in mercericals. Full details are given below:

ACID CITRIC—Has been in fairly steady demand at unchanged rates. It is still quoted at 1s. 13d. to 1s. 2d., according to quality.

ACID TARTRIC—Throughout the week has been in good demand at advanced rates. English manufacturers now quote at 11s. 4d. to 11s. 9d., whilst foreign brands of acid, both regular and powder, are worth 11d. to 11½d.

AMMONIA SALTS—Generally a firm market. Carbonate remains unchanged at 3½d. to 3½d. Liquor: Steady at 3d. to 3½d. Salt ammoniac: The quotation for first quality is unchanged, whilst with seconds at 3½d. Sulphate has been steadily advancing throughout the week, and still higher rates are probable. Grey 24 per cent. is now worth 2½d. per lb., which shows an advance of 10s. over last week’s closing rate.

ARSENIC—Selling steadily at unaltered rates, American being still worth 40s., with pots at 32s.

ARSENIC—No change is to be noted, and best powdered white remains at the quotation of 18s.

BENZOIC—Fifty per cent. is unchanged, the quotation being 1s. 90 per cent. is, however, lower, being also quoted at 1s.

BLEACHING POWDER—The steady demand has continued at unaltered rates, 27 to 27½ per lb. being the price in London, whilst in Liverpool it is quoted at 27 to 27½ per lb. f.o.b. or on rails.

BORAX—Still a dull market, and Convention prices are unchanged from 20s. for crystals, with powder at 21s., whilst in second hands it offers at 1s. to 1s. 6d. less.

COPPER SULPHATE—Sales have somewhat improved, although the prices are unaltered. Quotations range from 4½d. to 5½d. per lb., the latter price being paid for special brands.

CREAM OF TARTR—A very strong market at an advance of fully 2s. German makers’ quotations for powder on the spot are now 72s., whilst 70s. is the price for fine white French crystals.

MERCURIALS.—In consequence of the advance in quicksilver, the manufacturers raised the prices all round by 1d. per lb. on the 15th inst. The current quotations are now—Calomel, 2s. 11d.; red precipitate, 3s. 3d.; white precipitate, 3s. 2d.; corrosive sublimate, 2s. 7d.

PHOSPHOR—Unchanged, wedges being quoted at 2s., with sticks at 2s. 1d.

QUICKSILVER—Importers raised their quotations on the 13th inst. by 5s., and their price is now 27s., whilst in second hands, 27½s. is asked.

SALTPEPER.—Bengal, 2½ to 5 per cent. is quiet at 17s. 9d. on the spot. British refined is worth 22s. 6d. to 23s. 6d.

SODA COMPOUNDS—Unaltered. Barcarbonate, 27s. 5d. London, whilst in Liverpool it offers at 26s. 15s. 70 per cent. dull, sold at 25s., with 50 per cent., 21½ less. Crystals, 38s. Hyposulphites, 26s. 5s. in 1 cwt. bags (Liverpool).

THE DRUG MARKET.

THURSDAY, MAY 16, 1895.

The drug sales passed off very quietly to-day, there being few inquirers for many of the goods offered. Full details are given below:

ACACIA.—A fair amount was offered to-day, but met with little demand. Soudan sorts were in at prices ranging from 60s. to 65s. Four bales of Turkey sorts sold without reserve at 80s. to 90s. Picked gum from Trieste was bought in at prices ranging from 21s. to 21½ per cwt. Carnation (Japanese).—Fifteen bags of fair root were bought in at 25s.

ALOE.—Cape aloe remain firm. A parcel of 35 cases sold freely at 20s. to 22s. for broom seconds to good bright hard.

AMBROSE.—Curacao, 56 gourds, were bought at 21s. 6d. for dull, liver brown, whilst fair brown liver sold at 43s. Sootochrome was bought in at 70s. to 75s. for good soft brown of fair aroma.

AMBERGUS.—Only two bins were offered to-day, and they were bought in at 60s., a bid of 46s. 6d. being refused for greater quantity.

AMMONIACUM.—Five cases mixed seedy block, scented with asafetida, sold at 24s. The remainder of that offered was bought in at 40s., for seedy mixed gum part blocky.

ARUM.—Thirty bags of fair quality Spanish seed from Alicante was bought in to-day at 33s.

ANNATTO SEEDS.—In good demand, and higher prices were paid. Three bales Cocominata seed sold to-day at 4s. 6d., whilst a parcel a good bright Madras sold at 45s. 4d. to 4½d.

ARECA NUTS.—Bought in at 13s. 6d.

ARJUNA.—375 cases were offered again to-day, but met with no demand. The prices obtained were as follows: Pure grey almonds, mainly from 18s. to 20s. per cwt., partly blocky almonds, 77s. 6d. to 80s., good pinkish mixed blocky and drossy, 77s. 6d. to 80s., soft greyish and pinkish block, 35s.; and from 25s. to 15s. for ordinary gum.

BEZINO.—Sumatra: Seven cases of small almondy seconds, slightly false packed, sold at 27s. 7d. a cwt. Palmsang: Second, was bought in at 40s., and blocky thirds at 82s. 6d. Siamese and Penang gum was all bought in at steady rates.

BERRIES (YELLOW).—A parcel of fine new berries were all bought in at 70s. to 90s.

BUCHU.—Good bright round green leaves were bought in at 50s. to 64d., and the long variety at 6d. to 8d. A parcel of ordinary yellow short leaves sold freely at 2½d. to 3d. for 100.

CAFFEINE.—The scarcity continues, and it is said that 30cwt. has been bought for the next parcels in second hands. To-day two 7½ lb. lots of Whittens make were bought in, the price being 27s. 6d.

CALUMBA ROOT.—A parcel of ordinary mixed root, slightly worry, sold to-day at 7s.; fair to good bright yellow washed root was bought in at 32s. to 30s.

CAMPHOR (Crude).—Since our last report, prices have steadily advanced, and for arrival May to July shipment, 147s. 6d. to 162s. c.i.f., has been paid, with Japan at 150s. c.i.f. From Persia, an excited market is reported, and quotations are 172s. 6d. c.i.f., to-day. Japanese was bought in at 170s., and a portion of another parcel was sold at 160s.

CAMPHOR (REFINED).—On the 13th inst. English and German refiners again advanced their quotations for refined camphor, and current rates are now 1s. 96d. for bales and flowers in lots of not less than 10 cwt., with squares at proportionate rates. To-day 2 casks of German was bought in at 19s. 4d. a cwt. in London.

CANELLA ALBA.—Four bales of good small bark were bought in to-day at 32s.
CAITHBRIDGES.—Five casks of Russian flax were bought in to-day at 3s., whilst a parcel of somewhat dusty Chinese flax were also held, the limit being 1s. to 1s. 1d., according to size.

CARADONAS.—A large proportion of the caradonas offered to-day formed part of a cargo of the s.s. Powderdown from Ceylon, and had been damaged by water and smoke to varying extents. The prices obtained were 7d. to 9d. 6d., according to size and condition for Ceylon-Maori. Many for Ceylon-Mysore were small to medium, pale pulp, 8s. 6d. to 2s. 7d.; small to medium discoured, 1s. 6d. to 1s. 7d., down to 1s. 6d. for small dark split. Seed sold at 1s. 10d. to 1s. 11d. Ceylon-Maori, 13s. 6d.; for lots under 55 cwt., 17s. 9d. These quotations are for Cocaine in tins, 1-oz. bottles being charged 3d. per oz. more.

Coca.—Three bales of broken Trullio leaves of good colour were offered to-day. The best of the parcel was made up of four bales of first and good second, and the third and second class a-damaged sold at 9s. 6d. and 7s. 6d. respectively.

CASCARA SAGRADA.—To-day 89 bags were bought in at 17s. to 18s. 6d. for medium quality bark.

CASCARILLA.—Fourteen bales of small silvery bark were bought at 5s. 6d.

CAYMANS.—9 boxes were bought in at 100s.

CICHOREA.—A parcel of 43 boxes Crowns bark sold freely at rates ranging from 7d. to 11d., with 4s. 1d. to 8s. 6d. paid for first-class damaged.

CODININE.—Prices remain at the reduction rate noted last week, the quotations being 10s. 6d. to 10s. 9d., according to quantity and brand.

COLOSTHY.—Three cases of small broken Spanish were bought in to-day at 1s. 1d. Good qualities remain scarce.

COLUMNIA.—Bahia balsam of good bright colour sold today at 1s. 6d.

COURIER SEND.—East Indian seed was bought in to-day at 6s. 6d. per cwt.

CURBIES.—Entirely neglected. Good berries from Singapore were bought in at 55s. to 60s.; medium ditto, 45s.

CUVARounded.—Dusty Mallee seed sold without reserve at 3s. 6d. The remainder was bought in at 5s. 6d.

CUTTLIFEE.—Bought in at 2s. for small to bold, somewhat dull.

DRAGOON BLOOD.—Neglected. Two cases of fair Singapore bower, somewhat dull, were knocked down subject at £25 5s. The remainder was all bought in at the rates of £12 5s. to £15 for fine grade in seeds; ordinary bright to dull black 20 d. down to £6 10s.

ELESH GUM.—Lower. Twenty cases sold at 2s. 6d. to 27s. for somewhat dark, dirty gum to fair ditto.

ESPINOS OF E.R.—Ordinary quality Russian sold today at 9d. to 6d., whilst for Spanish Engot sold without reserve, 7d. to 7s. 6d. paid for wormy quality.

GALBANUM sold at 1s. 6d.

GAMMAGE.—Good blocky gum sold at 27 10s., whilst 25 17s. 6d. were paid for small, rather dull pieces, with split fracture.

HORSE.—A large amount offered, but there was no demand. Califronia was bought in at 4s.; Australian at 56s. to 26s.; Jamaica sold at 22s. subject, for dirty, somewhat thick.

IPPECACUANHA.—There was a good demand for lower grade of 20s. (Brazilian) which sold freely at 8s. 6d. to 8s. 11d. for ordinary damaged root. The fine or better very firm, as much as 4s. 11d. being paid for pulp, sound root. The bulk of the best root was bought in at from 4s. 6d. to 5s. 6d. Carthamaya is very firm, and 8s. 2d. to 8s. 3d. was paid for first-class damaged root.

JALAP.—Sold freely. A parcel of 67 bales were all sold at prices ranging from 9s. 6d. for fair sound Vera Cusas, down to 8s. 6d. to 8s. 7d. for mouldy, more or less damaged, and wormy.

KAMALA.—Three cases were bought in at 11d., the limit being 10d.

KING.—A box of East Indian gum was bought in at 230s.

KOLA.—All bought in at prices ranging from 1s. 6d. to 1s. 6d.

LITHIA CARBONATE.—Ten packages were bought in at 8s.

MORPHINE.—Unchanged, the current quotations being 4s. 6d. for 1000 co. lots, and 4s. 5d. for smaller wholesale quantities, with correl. 2d. per oz. more.

MYRRH.—Good clean siftings were sold at 51s., ordinary ditto 30s., pickings 20s.

NUX VOMICA.—Medium grey Bombay seed sold at 8s., with 2s. 6d. to 3s. 6d. paid for damaged.

OILS (ESSENTIAL).—Aniseed : Steady at unchanged rate, 6s. 6d. to 8s. 6d. for 1s. 10s. to 1s. 15s. on the spot. Bergamot : Four cases sold without reserve at 8s. Cajeput : Bought in to-day at 2s. 6d. Canphor : Bought in at 30s. Cassia : 8s. 6d. to 8s. is still asked for 7s. to 9s. per cent. Oil. Cardamom : Sold in to-day at 2s. 6d. Citromella : Very steady, and 1s. 6d. has been paid on the spot during the week. Lemon Grass : Namishly 1s. 6d. It was bought in to-day at that rate. Gorse : Bones sold in at 20s. Red pepper Demerara : Unchanged at 6s. 6d. H. G. Hotchips' oil is steady at 9s. 9d. to 10s. Japanese 40 p.c.o. Unaltered at 8s. 6d. Rose : Bought in at 4s. 6d.

OILS (FIXED) AND SPIRITS.—Finest new non-congealing oil is now worth 11s. 6d. on the spot per barrel of twenty-five gallons. Lineced steady, but quiet at unaltered rates, £2. 12s. 6d. being the price in barrels on the spot. Rapse : A dull market. Refined oil is still worth £2 10s. to £22 10s. on the spot. Terpenins : Very firm at advancing quotations. American : Spirits are to-day worth 22s. 6d. on the spot. Petroleum : Deader. American is quoted at 6s. 4d., water white, 8d. to 8s. 4d., and Russian, 5s. 6d. Spirit : American, 5s. 6d. to 8s. 6d. deodorised, 8s. 6d. to 9d.

OPPUM.—Steady prices continue to be paid. Persian, for which 12s. 6d. has been paid during the week for good quality. Turkey opium is dull of sale, and soft shipping descriptions are quoted nominally at 11s. 6d. to 12s. best druggists', 14s. to 16s. 6d.; seconds ditto, 9s. 6d. to 9s. 6d.

ORANGE PEE.—Coarse cut dark Malta peel was bought in at 6d., and fine cut bright, of good aroma, at 9d.

ORES ROOT.—Florentine : Best selected was bought in at 85s., with sorts at 72s. 6d.

QUININE SULPHATE.—There have been no sales of importance, and business is slow owing to the advanced prices asked. There are offers of 1s. 6d. for B. & S. or Brunswick, but holders ask 1s. 0d. To-day 5000 ozs. was bought in, a bid of 1s. 0d., not being forthcoming.

SABARAPILLA.—Good Lima Jamaica sold at 1s. 6d. to 1s. 8d., with Paraguay at 1s. 11d.

SHELLAC.—A very firm market at advanced prices. At the auctions on Tuesday no T.N. Orange was offered, and Garnet and Button were mostly bought in. All the Second Grades sold, the prices being £2 14s. to £2 15s. for good sale free A.D., and 2s 11d. to 2s 14s. for bright cased DJ. Privately 195s. has been paid for fair T.N. Orange and 180s. is now asked, whilst for A. C. Garnet 112s. has been paid, and 100s. for OCC.

SINGA ROOT.—Bought in at 1s. 6d., the bid being 1s. 6d.

SNAKE ROOT.—Bought in at 2s. 6d.

TAMARIND.—West Indian sold at 21s. to 24s., with East Indian at 7s. 6d.

WAX.—In fair demand only. Zanzibar, sold at £2 7s. 6d. Dull bleached Madras, £2 13s. San Domingo, £2 15s. to £7. Madagascar £2 7s. to £7 7s. 6d.
Exchange.
[Notices of books, apparatus, etc., for exchange, not exceeding thirty words including name and address, are inserted free in this column. Submitted should be written on post-cards, addressed "Editorial Department, 17, Bloomsbury Square, W.C.4," and must not partake of the nature of ordinary advertisements.]

OFFERED.
CHANGING BOX.—AAdam's plate, cost 50s., also 50 coloured photographic lantern slides; exchange either or both for 2 plate or 4 plate apparatus, or with without lens.
—Green, 355, Wandsworth Road, S.W.
—Barnett and Forrest's Soda-Water Machine, 12 size, equal to new, price 21s. —Apply to R. H., 1, Southwick Street, W.

New Books and New Editions.
[Publishers are invited to forward full particulars of new publications, including price.]

Die Schmerztherapie der Diabetiker. By Dr. Adolf Baumann. (August Hirschwald, Berlin.)

B. Bradshaw's Dictionary of Bathing Places and Climatic Health Resorts. With a map, price 3s. 6d.

Field-path Eamles among the Surrey Hills. By W. Miles. (B. E. Taylor and Son, London.)

Electrical Homes and Electrical Shops. By S. F. Walker. (Whittaker and Co., London.)

Chemists and their Wonders. By F. M. Holmes. 1s. 6d. (S. W. Partridge and Co., London.)

Company Business.

* * * * *

Disinfector Company, Limited.—Registered by John Monroe, 11, Nelson Street, Commercial Road, E., with a capital of £9000 in 25 shares. Objects: To carry on business as manufacturers of, and dealers in, disinfectants, liquid, powder, tablets, etc., acids, soaps, chemicals, etc.

Late Advertisement.

Open Street.—To Chemists and others. To be disposed of, owing to the death of the proprietor. Near Blackfriars, S.E. Been carried on by late proprietor for about 20 years. Easy terms. Medicus, 1, George St., Mansion House, E.C.

Diary of the Week.
[Notices for insertion under this heading should reach the Editor on or before Wednesday.]

Saturday, May 18.  
Pharmaceutical Cricket Club v. Burgess, Burbidge and Co., at Willesden. Train leaves Euston at 3.15 p.m. School of Pharmacy Students' Association.  
Botanical Excursion to Willesden. Train from Euston 2.15 p.m.

Monday, May 20.  
Medical Society of London.  

Tuesday, May 21.  
Pharmaceutical Society of Great Britain, at 8 p.m. Annual Dinner at the Whitehall Rooms, Euston Metrópolis.

Royal Institution of Great Britain, at 3 p.m. "Thirty years Progress in Biological Science" (Second Lecture), by Professor E. Ray Lankester.  
Royal Photographic Society, at 8 p.m. Apparatus for Process Photography, by William Gamble.  
Institution of Civil Engineers, at 8 p.m. Ordinary Meeting.

Wednesday, May 22.  
Pharmaceutical Society of Great Britain, at 11 a.m. Annual Meeting.

Geological Society of London, at 8 p.m. Evening Meeting.

Nottingham and Notts. Chemists' Association, at 4 p.m. Annual Meeting at the Masonic Hall, Goldsmith Street.  
Discussion on the "Shops (Early Closing) Bill." Thursday, May 23.

Royal Institution of Great Britain, at 3 p.m. "The Instruments and Methods of Spectroscopic Astronomy," by Dr. W. H. Huxley.

Friday, May 24.

Linnean Society of London, at 3 p.m. Anniversary Meeting.

Saturday, May 25.  
Royal Institution of Great Britain, at 8 p.m. "Picture Making" (Second Lecture), by Seymour Lucas.

Geologists' Association (London). Excursion to Goring. Leave Paddington at 10.2 a.m.

Partnerships Dissolved.
[From the London Gazette.]

William Borrow Trigch and William Bowden, chemists and druggists, 206, Edgeware Road, W., carrying on business under the style of William and Bowden. Debts will be received and paid by W. B. Trigch.  
* * * * *

Edward Worsell and Arthur Edward For, chemists and druggists, 23, Parson's Street, Banbury.  
* * * * *

Frank Iliffe and William Iliffe, surgeons, Derby.  
* * * * *

Samuel Kennedy and Samuel Arthur Stoddart Kennedy, physicians and surgeons, 23, George St.reet, Harewood, W. Debts will be received and paid by Samuel Kennedy.  
* * * * *

Buckley Brooks and Harry Edgar Casser, carrying on business as chemists and chemical agents under the style of B. Brooks and Co., 13A, Exchequer Street, Cheapside, Manchester. The business will be carried on by Buckley Brooks under the same style as heretofore.  
* * * * *

Thomas Henry Duckworth and Samuel Wright, carrying on business at A. Herriot Street, Oldham, as manufacturers and sellers of all kinds of water manufactures and ale and porter bottles, under the style of Duckworth and Wright.
PHARMACEUTICAL JOURNAL

SUPPLEMENT

LONDON, MAY 25, 1895.

Pharmaceutical Journal.
Fifty-Fourth Year of Publication.
A Weekly Record of Pharmacy and Allied Sciences.

The oldest Journal addressing Pharmacists.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.
Publishing and Advertising Office, 5, SÆRLE STREET, W.G.
PUBLISHED WEEKLY, PRICE FOURPENCE.
AN AVERAGE OF 7,000 COPIES PRINTED WEEKLY.
ANNUAL SUBSCRIPTION, INCLUDING POSTAGE, 10s. 6d.

In addition to being the sole periodical publishing full and complete reports of the transactions of the Pharmaceutical Society and of the British Pharmaceutical Conference, the JOURNAL records the proceedings of pharmaceutical and other scientific societies throughout the country, and chronicles all important advances in pharmacy and allied subjects in this country and abroad. Reviews of new scientific and technical works form an important feature in the JOURNAL, and its pages are also open for the discussion of matters of importance to British pharmacists generally, as well as for the purpose of supplying special information desired by subscribers.

The JOURNAL is supplied from the Publishing Office, 5, SÆrle St., Lincoln's Inn, W.C., post free for twelve months to any address throughout the world, on receipt of remittance for Ten Shillings and Sixpence.

PHOTOGRAPHY FOR CHEMISTS.

An exhibition of photography is now open at the Imperial Institute, and whilst by no means so representative as it should be, a very good idea can be gained from it of the numerous ramifications of this art-science and the many sciences to which it has become a most valuable handmaid. Taking, for example, astronomy, the assistance rendered by photography is not to be despised. If an expert and keen-eyed observer takes his seat at the eye-piece of the telescope he will see more at the first moment than is possible by any continued observation, from the simple physiological fact that the retinal nerves become fatigued, whereas if instead of the retinal surface the sensitive plate is presented to the telescopic image the chemical or electro-chemical action which takes place is cumulative, so that at the end of one minute the photographic retina, if we may call it so, will see sixty times the amount of detail or stars that it did at the first second of observation; and 5000 times the number of stars at the end of the first hour. Beyond this also is the important point that the factor of the personal equation, which obviously is with different observers by no means constant, is totally eliminated. It may of course be said that there is what may be termed a “personal equation” with a photographic plate, but this is a far more measurable quantity than the human factor, and that we have not yet reached the complete valuation of the photographic factor is due to a lack of serious study on the part of those whom it most concerns, but this is now engaging the attention of the most advanced of experts. As an example of photography applied to utilitarian arts as opposed to an abstruse science, reference may be made to the preparation of line and half-tone blocks for the reproduction of originals, both drawings and photographs. The oft-repeated cry that photo-mechanical processes have killed wood engraving, whilst not strictly true, has at least sufficient truth in it to cause several well-known and long-established wood engraving firms to file a petition in bankruptcy or else embark upon capital in photography. Nor is it an exaggeration to state that many of our serial publications literally owe their birth and present existence to photography.

The pharmacist may possibly wonder what value photography may be to him, and this is not a difficult question to answer. To the apprentice and student it may be a valuable means of instruction, or from correctly prepared photographs he may learn the actual appearances of materia medica and microscopio specimens, so that he can recognise the same when he meets with them in the shop or in the examination-room far more readily than the wood-cuts or drawings which adorn the pages of our textbooks are alone available. After having successfully run the gamut of the examiners, and blossomed out into a full-blown pharmacist, photography may well be turned to commercial purposes, and from its enthusiastic devotees some of the burdensome rent, rates, and taxes may be gleaned. An amateur photographer is as a rule the most enthusiastic, ever ready to spend money in new apparatus, in new plates and printing papers, in photographic literature; but to successfully deal with the trade it is necessary to understand photography, and a chemist is surely far from being the man, above all others to successfully cope with the exact science of photography, and the man to take as an adjutant to his business the supply of photographic chemicals and apparatus. To the more advanced chemist who has taken up photography as a hobby as a relief from or adjunct to business, photography becomes a valuable handmaid, as well-prepared photo-micrographs are infinitely superior to any hand drawings by camera lucida, etc. Photography may also be utilised by the advanced chemist and analyst for obtaining undeniable records of characteristic absorption or line spectra. The process will not only find his work rendered easier and more entertaining to his students by the projection of lantern slides of diagrams, equations, and microscopic specimens, but as this can be done in almost full daylight, there is no need to trouble about having the room darkened. Even chemical experiments can be projected on to the screen in actual operation, and the formation of a precipitate, the characteristic coloration or shape of a crystal, can be far more readily grasped by the student when seen on an eight-foot screen, than
in the small test tube in the demonstrator's hands; whilst knowledge thus gained through the channels of eye and ear is far more likely to be of lasting benefit than in any other way. That this has been recognised by several of our large universities is possibly a well-known fact, and that even the Board School has adopted the lantern for its advanced evening classes is surely a sign that it is a subject not to be lightly dismissed.

Putting on one side, however, the utilitarian applications of photography, it may well serve as a relaxation for the tired and overworked pharmacist. For by a thorough change of thought, by inducing him to make excursions, by giving him an object for his walks or an amusement and purpose in his holidays, it will become a keen fascination and total relief from the worries and cares of everyday business. The necessary outcry at first is but small, and care and patience are all that are necessary, whilst the various manipulations, involving the handling of exact quantities of chemicals which to the untrained and popular mind seem so difficult, are a matter of course to the practical chemist.

To the scientific chemist there is in photography a vast field for experimental work and for original investigations, and many opportunities for gaining fame and more solid rewards; for photography may yet be considered in its infancy, and the best known men, or at least some of them, are practical and practical only from long experience. They are able to do what they do, and speak with authority, from the practical standpoint, but from the purely scientific side there are very few who can speak with authority, or who can bring to bear upon the consideration of any subject the necessary scientific training or chemical knowledge, and photography is to a great extent a science based on purely chemical grounds. Commencing with this week it is proposed to present the readers of the Journal with a series of practical articles on photography as an adjunct to the ordinary business of a chemist, including formulae and practical directions for working, from which may be gleaned not only the necessary information how to compound the special solutions, but also how to actually take photographs. As a further help queries upon all matters connected with photography will be answered with care and interest, even for any special preparations for which there may be a demand or seem a likely chance of pushing.

THE SALE OF PHOTOGRAPHIC REQUISITES.

There can be no doubt that the sale of photographic requisites is a lucrative business when properly managed, and chemists are, or readily can adapt themselves to be, the tradesmen best fitted to handle them. The amount of business to be done in this line will naturally depend upon the kind of neighbourhood of which any individual chemist may be the centre. It is quite possible even at the present time to find districts containing not more than two or three amateur photographers, and perhaps the number has not materially increased. In such a locality it would pay a chemist quite as well, probably much better, to fill his pharmacy with safety bicycles or perambulators. But in the larger provincial towns, especially at seaside or other health or pleasure resorts, there is fine scope for a paying addition to a chemist's business, providing he has the time, room, and one or two other desirable qualifications.

Amongst these latter may be mentioned a certain amount of practical knowledge on the subject of photography by the chemist himself. This is by no means difficult to obtain. But it must be practical—the chemist must be able to do his own exposing, developing, printing, etc., and then with the experience of his previous scientific and technical training he will soon be in a position to give advice and assistance to the amateur who, in the earlier days of his photographic career, is continually in some desperate trouble or other. Many of these troubles arise from careless and incorrect preparation of the solutions required in the processes, and as a matter of fact there are chemists who have never sold or used a camera in their lives who do quite a nice little trade in simply making up the needed solutions—a department of dispensing worth looking into, which, saving the amateur much time and trouble, will be well patronised by those who are too busy or too lazy to do their own compounding.

It should, however, be mentioned that no attempt should be made to preserve the composition of the solutions as a priceless secret. Photographic literature, both serial and textbook, is so copious now that the amateur can be very successfully assisted. The amateur photographer of to-day is of the new school, and must know what his solutions are composed. Not that it will be necessary to print the actual working formula on the label, but as an example of what is meant, the following may serve:

Pyrogallol Developer.

Every fluid dram contains 6 grains of pure pyrogallol combined with a sulphite to prevent its from scaling.

John Smith, Pharmaceutical and Photographic Chemist, 146, Bellevue Park, Newtown.

Free dark-room for the use of customers.

This may serve as a model on which to found others, and in succeeding articles formulae will be given for preparing such solutions.

It is also well that the chemist should be able to show some of his own work (providing he can produce something worth showing), ticketing it as "taken with such and such's 10s. 6d. landscape lens," or "with the £4 4½ instantaneous set," and so forth. The chemist who can turn out a fairly good landscape photo, especially if it is in or near some show place, can work up a profitable trade in the sale of "photos of the district," apart from the sale of apparatus and chemicals.

The chemist who is also an amateur photographer will of course have a dark-room, which can be used on occasion by those of his passing customers who may require it, but even if he is not, a dark-room is almost a necessity. The chemist himself will know what room, closet, or even cellar, will best suit his purpose, but failing all these he might build one of black twill made light-tight with jelly fabric, stretched on a light wooden frame and placed in a corner of the shop. It need not take up much room, and outside may be so fitted with shelves, books, etc., for showing photo or other light goods, that its real nature is not at first apparent to the uninitiated.

To a great extent the size of the dark-room will depend upon the work that is to be done; it is frequently the case that many chemists keep a dark-room merely for changing plates in, and this is usually when they themselves do not photograph. Others, again, have sufficiently commodious rooms for developing. When a dark-room has been fitted up a note should at once be sent to the editors of the Amateur Photographer, 1, Creed Lane, London, E.C., and Photography, Hertford Street, Coventry, stating whether the room is for changing only or for developing as well. It both these offices a register of dark-rooms is kept, and many are the applications these gentlemen have to reply to for the addresses of local dealers and dark-rooms.
The question as to "free" or "charge" for dark-room use is a vexed one, but this can well be got over by stating prominently "free use of dark room to customers for changing plates." This may lead of course to a question of how much the customer must spend, but that can without doubt be left to the good taste of both parties. To strange visitors a charge of 5d. should be levied for changing, whilst in all cases a charge of 6d. or 1s. per hour should be made for developing, exclusive of chemicals. A very good plan, particularly at the seaside, is to offer the customer the free run of the dark room both for changing and developing, for say 5s. per week, or half this sum for changing only. This will of course, apply to migratory customers only, but for local amateurs it is preferable to give them free run of the place in the hope that the oftener they visit the shop the more likely they are to buy.

The nature and amount of the initial stock will depend upon the possible resources of the neighbourhood, but as a general working rule take this advice: "Buy for 1-pl. and 4-pl. customers." Cameras, plates, dishes, etc., are made to definite measurements from the small "Eastern" size (3½ by 2¼) up to huge things 20 in. by 16 or larger, but the 1-pl. and 4-plate (4½ by 3½) are by far the most popular sizes. These measurements are the actual dimensions of the sensitive plates, and a camera which will not take a larger plate than one measuring 4½ by 3½ is called a 1-pl. camera. By means of "carriers" the 1-pl. camera may be made to take smaller sizes, but it is required to expose a larger plate a larger camera must be used. The greater number of those who take up photography as an amusement will probably buy a 1-pl. camera to commence with, requiring 1-pl. dishes, printing frames, etc., while a large percentage will start with a 4-pl. camera, and consequently require 1-pl. and 4-pl. stoppers. But those who buy a larger camera than the 1-pl. (or an intermediate size between that and the 4-pl.) form a very small minority: hence in putting in stock the 1-pl. and 4-pl. customer is the one to be primarily considered. Messrs. Lancaster and Underwood, of Birmingham, have a world-wide reputation for good, useful cameras at a moderate price, while similar or more expensive goods will be found listed in many of the wholesale patent medicine catalogues, or in the lists of special makers, such as dark-room and photographic articles. Mr. H. G. Bay and Mr. G. C. Raymont will be seen that the "camera," generally, though not necessarily, includes the camera, lens and cap, dark slide, and sometimes the tripod stand. In addition to this, the "dark cloth" to throw over the head and part of the camera while focusing is necessary. Then come the sensitive plates sold in light-tight packages of one dozen each. Their name is legion, but the "Ilford," "Britannia," "Cadette," "Watten and Wainwright," and "Peget" are amongst those most frequently asked for.

Now we have all that is necessary for exposing the plate. Then comes the dark-room, with its ruby lamp, its porcelain or ebonite dishes, and its solutions for developing and fixing. When the picture is finished as far as the sensitive plate is concerned, the process of printing or bringing out the picture on prepared paper commences. For this we require sensitive or printing-out paper, printing frames, and further dishes for holding the toning and fixing solutions. Of printing-out papers there is a great variety (suggesting a variety of solutions for their manipulation), but the stock paper is the gelatino-chloride printing out paper, which can be had tinted blue or pink, or of a pure white colour. It will be desirable to keep this in the large sheets for the customer to cut to his own liking, and in packages with round and square-cut corners to definite sizes, particularly the quarter and half plate sizes. The favourite papers are the Bromide, the Ilford and Solio P.O.P., and the Platinotype, prices of which will be found in any list, and directions for working accompanying each packet. The printing frame is a simple matter, the cheap oak or teak article with square corners being as suitable for ordinary work as the more elaborate and expensive ones. The paper after toning and fixing requires washing. Various machines for this purpose are advertised, but a copious supply of running water is the desideratum, and with it a large shallow dish is all that is really required. Then comes trimming previous to mounting, and a few trimmers and cutting glasses should be included in the stock.

Lastly, the requisites for mounting the finished picture, the most important of which are the mounting paste (which the chemist can make himself), the squeegee, a roller for ensuring evenness of surface, and the cards and mounts of various sizes, including the carte-de-visites and cabinet (tinted and gold bevelled for the particular ones) for portraits, and the Oxford line and Indian tint mounts for landscapes and groups.

A perusal of a photographic price-list will show a great variety of more or less useful appliances, and special articles for special processes will be found in great abundance, but the items named in this short survey, while essential, are not discouragingly multitudinous, and with a comparatively small outlay a respectable start may be made in a departure which to many chemists has proved to be not only of a remunerative, but also of a decidedly instructive and interesting, nature.

Amateur photographers are voracious readers as a rule, and therefore their wants in this direction should also be catered for. There are several photographic journals and innumerable books on photography, and of the former the "Amateur Photographer and Photography" are the most likely to sell, whilst of textbooks an assortment should be obtained; a list will be given later of the best works to stock.

The chemist who takes up photography as a branch of his business will be wise if he keeps himself also pretty well posted in current photographic topics, though he may fairly well rely upon the notes which will subsequently appear in these pages to keep him an consort with what is likely to sell.

TRADE OPINIONS.

Several communications have been received from firms interested in the photographic business, in response to a request that they would furnish hints as to the stock likely to prove most useful to a chemist going into the business.

** ** ** **

Messrs. B. and J. Beck, Ltd., 68, Cornhill, London, E.C., the noted opticians, write as follows:

Now hear a story that may interest the expert amateur. They will first take up the sale of photographic apparatus and material, the chemist would probably find his customers would largely consist of novices, as many of the expert amateurs would already have other sources of supply. He should therefore stock with a view to supplying the novice. The most well-known and well-advertised plates, films, papers, and apparatus which require least explanation, would be likely to sell best, as the novice hardly knows what he wants. Such well-known brands of plates as Ilford, Cadet, Barnet, Paget, and Imperial are always salable, as also are ordinary and Fresn films by Austin Edwards, B. J. Edwards, Fitch, etc. Papers by Ilford, Eastman, Elliott, and Paget, are the best known. The greatest care would be required in stockmg cameras, and at first well-advertised hand cameras by the best...
FORMULÉ AND PRACTICAL DIRECTIONS.

[The formulé and directions for working here are specially compiled for "photographers" by practical chemists for photographers, who will be pleased to supply any special information required, or answer photographic queries. Letters should be addressed to "Editorial Deportment, 17, Bloomsbury Square, W.C.," with the word "Photography" in upper-left hand corner of envelope.]

SOME STANDARD STOCK SOLUTIONS.

Pyro Solution.

Pyrogallic acid 1.0 oz (un) 1 oz. (un)
Potassium metabisulfite 1 oz.
Distilled water to make 9 oz. (un) 55.5 mls.

Dissolve the metabisulfite in 6 oz. of water, then pour the bottle of pyro and pour on to the solution of metabisulfite, add sufficient water to make up the full bald and bottle immediately. This should not be filtered.

The alkali to be used with this may be either ammonia, soda, potash, or preferably, the new salt—sodium tribasic phosphate (see below)—and a 10 per cent. solution should be made, using liq. ammonia 880, sodi carb. B.P., or potash carb. B.P. Besides these a third solution, 18 per cent. of potassium bromide, will also be required.

The pyro solution should be put up in a 16-oz. flat, the alkali in a 10-oz. oval, and a 4-oz. bottle of the bromide will be sufficient to form a set of developing solutions which can be sold for a shilling and yield a far more handsome profit than a patent medicine.

CITRATE RESTRAINERS.

The use of the citrates of ammonium, potash, and soda, is increasing, their action being different to that of the alkaline bichromate. The chief thing the photographer always finds a trouble in making these. The chemist will have no trouble, and the B.P. formula for liq. amm. cit. fort. may be adopted as the basis, and the amount of resultant citrate calculated out, and the directions for diluting so as to form a 10 per cent. solution printed on the label.

METAL DEVELOPER.

At the present time some of the newer reducing agents are far more in favour with amateurs, particularly for hand camera or instantaneous work, and the following typical formulé has proved very successful:

Metal is possibly an unknown salt to many chemists, but it is the sulphate, chloride, or oxalate salt of the methyl-para-amidosalicylic acid, and it is an extremely energetic reducing agent, and gives negatives of great softness and full of gradation which are suitable for printing on all papers, and which when the negative has been correctly printed, it is impossible to use metal even for one plate without irritation of the skin and small vesicles immediately showing.

The developer is as usual in two solutions.

METAL AND HYDROQUINONE SOLUTIONS.

Metal 25 gms.
Hydroquinone 120 gms.
Sodium Sulphite 14 oz.
Distilled water to 10 oz.

Dissolve in the above order.

THE ALKALI.

Sodium tribasic phosphate 300 gms.
Distilled water to 10 oz.

For use, mix one part of the metal solution with two parts of this alkali. It will be evident from the above formulé, and from instantaneous work it is advisable to omit it. For time exposures, one grain of bromide of potassium may be added to each ounce of developer.

SODIUM TRIBASIC PHOSPHATE.

M.M. A. and L. Lumière and Sayewits have introduced this salt to replace the usual alkaline calcium carbonate, and from practical trial I can strongly recommend it.
as giving not only fine detail and gradation, but also good density with less risk of fog and frilling than with the other alkalies. Its formula is Na₂CO₃, 18H₂O, and theoretically 138 parts correspond to 100 of sodium carbonate crystallised, Na₂CO₃, 18H₂O; 100 parts of water at 60°F, dissolve 16 parts of the tribasic phosphate, but its solubility increases enormously with rise of temperature, and 100 parts of boiling water dissolve 280 parts. Messrs. Fuerst Bros., 17, Philpot Lane, are the English agents for it, and the price is 1s. per lb. retail.

Chloride of Gold.

Somehow one always associates painting for gold chloride, and the following method may be adopted for home manufacture, and a considerable saving effected if you can sell ready prepared toning baths, or even a simple solution of chloride of gold, which is guaranteed to keep, ought to sell well.

Take an Australian sovereign, bend it or cut it until you can slide it into a test tube, and pour on it 1 drachm of nitric acid and 8 drachms of hydrochloric (bath, of course, the B.P. pure). Place the test tube in a cup or gill-goblet half full of hot water on the kitchen range or sitting-room hob, so that the nitrous acid may go up the chimney. After some time it will be found that the sovereign will have diminished drearily, and to on removing the now cooled water with fresh hot no more gas is evolved, pour off the solution and add a fresh lot of acid. Repeat this till the whole of the sovereign has disappeared, and nothing but a little white precipitate remains at the bottom of the test tube. This is silver chloride, Australian sovereigns being alloyed with silver, which of course forms chloride, insoluble in water, with the hydrochloric acid.

Now place the whole of the solution in a porcelain dish on a water bath and boil up, if this can be done over the kitchen fire so much the better, as the purpose of heating is to drive off the excess of acid, which is not pleasant flying about a shop. When the heat has been applied for some time the solution may be removed and diluted with distilled water till it measures 17/4 fluid drachms the total bulk, and every drachm will contain 1 grain of pure chloride of gold. Each sovereign yields 80 grains, when making chloride of gold never apply direct heat to the test tube or evaporating dish; always use the water bath. If the tube does break then you can save the gold. Also, chloride of gold is sensitive to light, therefore the stock solution must be well protected.

Now as most commercial samples of chloride of gold are sold in 15 gr. tubes at 2s. each, which bear a label "guaranteed to contain 7 grains of pure gold", it is not difficult to calculate out the profit. In round figures the above solution will represent sixteen tubes of commercial gold chloride:

<table>
<thead>

<td>22s.</td>
<td>1s.</td>
<td>1s.</td>
</tr>
<tr>
<td>23s.</td>
<td>1s.</td>
<td>1s.</td>
</tr>
</tbody>
</table>

Query.—Is this better than patent medicines? The following may be the label:

**Solution of Chloride of Gold.**

Every fluid drachm contains 1 grain of pure chloride of gold. Fifteen to 10 grains of pure gold; most commercial samples of chloride of gold only contain 7 grains of pure gold in 15 grains.

**Directions for use.**—Before use add sufficient precipitating carbonate of lime to dissolve the gold completely. After allowing to settle, remove and add the requisite quantity of acetate, borax, or sulpho-cyanide to form the usual toning bath.

The Sulpho-cyanide Toning Bath.

At the present time when gelatino-chloride printing out papers, or as they are familiarly called P.O.P., are so much in vogue, a concentrated toning bath should sell well. So many have been carelessly made over this bath, and will readily buy one which is already mixed and merely requires diluting with water to be ready for use, with the advantage that any quantity may be made up even for one or two prints, that it ought to be a good selling line.

Take of chloride of gold, 15 grs., if the solid salt, add to it 1 oz. of distilled water. Of the solution recommended above take 1 oz., add precipitated chalk and shake thoroughly, allow to stand half-an-hour to completely neutralise any acidity. Now dissolve 1 oz. of sulpho-cyanide of potassium in 1 oz. of distilled water. Filter the solution through a small filter paper. When it has all run through filter the sulpho-cyanide solution through the same paper into the gold solution, and then wash the filter paper with sufficient distilled water to make the solution measure 45 fluid drachms. The temperature will be thick and deeper cast standing an orange-yellow precipitate, which is sulpho-cyanide of gold. Bottle the solution and precipitate, and label. "Shake the bottle."

As this sulpho-cyanide of gold is in itself a light sensitive salt, chemists who wish to keep it in stock should pack it in cardboard cases, or else wrap it up in deep ruby red, or brown wrapping paper.

**Concentrated Sulpho-cyanide Gold Bath.**

Every three drachms of this bath is equal to 1 grain of pure chloride of gold which is sufficient to tone half a sheet of P.O.P.

For use, dilute 3 drachms with 8 ounces of warm distilled water, and use when cool. Place the prints as taken from the printing frame into salt, 2 ounces; water, 20 ounces; allow to remain for five minutes, then wash for five minutes in running water and tone. Then fix.

**Photographic Notes.**

**Carbon Printing.**—E. W. Forrester recommends photographers, as a time-saver, in printing negatives to sensitise as well as to develop, so as to ensure correct exposure. Carbon tinsel, he points out, from the time it is dried, whether it is manufactured in the sensitive state or is sensitised afterwards, keeps on increasing its sensibility until the end of its useful life. Therefore it is always advisable to ascertain how sensitive it really is at the time of using. A simple way of doing so is to select a small negative, one that is not very dense, and keep it in a printing frame specially for this particular purpose. Place a piece of the tinsel behind it, and make a print, giving always one and the same exposure, say two or three times by the actinometer that is in constant use. When printed, mount on it on a bit of single transfer paper and develop. According as the print is over or under-exposed so, after very little experience is gained, will the sensitiveness of the tinsel be gauged to a nicety. In carbon printing, as well known, it has great latitude in exposure, as any longer, within very wide limits in either direction, can be remedied in the development. But when the exposure is approximately correct, a great deal of time and trouble will be saved in the development of the prints and correctness can always be ensured by adopting the simple expedient here referred to. As a rule, supposing the issue has been dried under ordinary conditions, it will, for general purposes, be found to work better when it is a few days old than when it is freshly sensitised. As to the keeping properties of the tinsel nothing definite can be said, as all must depend upon the conditions under which it is kept. Some explanation of those conditions and their influence may, however, be desirable. Tinsel may be sensitised one day, and become quite insoluble in a couple of days afterwards, or it may be kept in a perfectly soluble condition for many months. The writer has kept it for six months, and it was then as soluble as it was at first. He considers that the chief factor in the case is moisture. "If the tinsel is not properly dried in the first instance, or is allowed to absorb moisture too freely, it will rapidly lose its sensitivity. If, on the other hand, it is made thoroughly dry, and is kept so, it will keep its solubility for a long period. In the case of its being kept six months, the tinsel was completely desiccated, and put in a big muslin over this bath, and will readily buy one which is already mixed and merely requires diluting with water to be ready for use, with the advantage that any quantity may be made up even for one or two prints, that is ought to be a good selling line.
Glossing Plates.—T. Rogers states that a brilliant surface may be imparted to any gelatin paper, whether bromide paper or gelatino-chloride, by proceeding as follows:—"Prepare a sheet of glass of brilliant surface, absolutely free from scratches, and absolutely clean. Wash the glass, dry it carefully, and rub it lightly with a little liquid pure beeswax. Take a dry, soft flannel rag, warm the plate until the wax melts, and with the rag rub it all over the plate until every portion of the glass is covered. As soon as you are sure of this, commence to rub the wax off again on to the flannel, rubbing slightly in a circular direction, and all over the plate, so that one portion is not left thick with wax when another portion is clean glass. When the wax has almost disappeared from the glass take another flannel, clean, to give a final polishing. Use this exceedingly lightly, and stop as soon as over the wax becomes invisible over the whole surface of the plate. At this stage the glass will be evenly coated with an invisible film of wax, and will have a most brilliant surface. Further rubbing or hard rubbing would entirely remove the wax from portions of the surface, causing the prints to stick to such portions. Take the prints wet from the final washing, let them drip, then at a time far enough afterwards on the plate glass, gently but firmly press them into contact, and removing all air-bells by the application of the squeegee. When all the prints have been squeegeed on to the glass, it can be stood on end in a dry, slightly warm place, so that the print will peel off in pieces. If the waxing is properly done, the prints should leave the glass perfectly clean. Polish it with a dry rag, and it is ready for next washing. If thoroughly and carefully done, even small timesaving will get the glass into a 'ripe' condition, so that several batches of prints may be squeegeed on to it without further waxing. If, when quite dry, the prints stick to the glass so as to tear in drawing off, it proves that the waxing was insufficient."—English Mechanic and Photography.

Orthochromatic Plates and Photo-Micrography.—A writer in the Glasgow Evening Citizen says that in photo-mechanical work the advantages of the orthochromatic plates are perhaps more apparent than in any other branch of photography. With their aid the microscopist is now enabled to photograph many subjects that in years past were beyond his facilities or an orthochromated gelatino-bromide dry plate. "Among such subjects may be mentioned the sting and poison-sac of the honey bee, which, when stained, range in colour from a bright and dark yellowish, the most delicate hues. With the employment of an intermediate shield of yellow or canary-coloured screen, orthochromatic plates render those colour values most admirably, the only drawback being the coarseness of the grain in the results negative. Were makers to put upon the market an orthochromatic plate of a less exalted degree of sensitiveness, whereby the coarseness of the grain would be much reduced, microscopists would eagerly accept such as a further distinct advance."—Photography.

Grape Fruit as a Tonic.—Grape fruit, plump and juicy in spring, is an admirable tonic, as well as a most appetising breakfast or luncheon relish. A doctor says that the sharp stimulus of fruit is the best thing to set the digestive organs in order for the day, and the peculiar properties of the grape fruit are pronounced in the health of the stomach. When eaten at luncheon it is prepared in a different way than for breakfast service. For the second meal the contents of two halves should be scraped out, the seeds and the outer covering of the skin taken out and the pulp and juice thus obtained used to fill one of the halves, which it will just about do. A tablespoonful of sugar and one of rum or sherry mixed with the juicy pulp adds the desired effect. At breakfast time, after the long sleep of winter, the meat is eaten out as is that of an orange, and very little sugar is used, many persons preferring none, on the ground that its full medicinal value is better obtained.—Popular Science News.
THE IMPERIAL INSTITUTE EXHIBITION OF PHOTOGRAPHY.

This exhibition, which has been organised by the United Kingdom section of the Imperial in-situ, was opened to the public on the 11th inst. It is to be regretted that the general arrangements were not entrusted to those men whose reputation for prudence and practical knowledge, were most competent to have made the exhibition a huge success, and really representative of photography in all its branches. As it is, a large number of the exhibits have been left owing to the extravagant terms which the authorities wished to impose upon them, and one looks in vain for many names which are by-words in the trade. These difficulties could readily have been avoided if the fact had been displayed by the promoters, who ought by now to be alive to the fact that a policy of "give and take" is absolutely essential to success. In spite of these drawbacks, the exhibition contains much that is of interest, although it is doubtful whether it will be much patronised by the general public. The larger portion of the exhibition, comprising the portions devoted to photography from an educational and industrial standpoint, is arranged on the ground floor in the North Gallery, and is now fairly complete.

Beginning at the east end, the astronomical section first claims attention. This includes a large collection of photographs of the motion of the stars and nebulae, as well as various stellar, lunar, and solar photos. The Observatory at Cambridge University also show a set of lunar photos, more recent ones. The Geological section has been lent by A. W. Cladmore, Col. Saunders, and others.

The next section, which illustrates the uses of photography applied to various sciences, contains much of interest. Mr. Frederick Liss, of Birmingham, shows a beautiful collection of photographs of the stars, with high magnifications, and a series of prints sent by Messrs. Fuerst Brothers and others. The correct colour rendering obtained from Linnear's ortho-chromatic dry plates. Mr. C. F. Baker shows a complete set of photo-micrographic apparatus for demonstration purposes, whilst a series of photographs of a splashing drop sent by Professor Worthington are of considerable interest. In this section, an active exhibit is a set of photographs of explosions of boilers, powder magazines, etc., lent by the Home Office.

The next two sections, comprising the photo-mechanical and photo-ceramic work, are the most interesting in the whole exhibition. The latter is here carried out by Messrs. H. Snowdon Ward and J. W. Wall, upon whom they reflect great credit. Three-colour printing has received especial attention, and includes specimens of the French process, as well as the actual blocks, plates, etc., used in the process. The results now obtained by this method are simply marvellous, and indicate the high standard in artistic work which photography has now attained. The principle adopted in all cases is practically the same, and this style of printing seems destined to supersede chromo-lithography, since it produces results which are more delicate and of crisper and more transparent character. In America, the process has been utilised for printing the patterns of coloured rugs and carpets, so that commercial travellers can show these to their customers instead of the ordinary cumbersome samples.

The Photographic Arts Society, Limited, shows a fine collection of photographs after Raphael, Reynolds, and other masters, some of which are taken direct in colours by the Mathieu process, whilst others illustrate the "Imperial Camera." The Royal Astronomical Society has a fine collection of photographs on china and enamel. There is, of course, nothing new in this process, the object of the demonstration being to simplify a method which has hitherto been hopelessly laborious. *Figures* of a select few for the sake of extra profit. Even now however, the prices have been enormously reduced, and will be more so as the process becomes more general. Mr. Henry's demonstration includes the preparation of the film, coating the plates, exposure, development by vitrifiable powder, and transfer to china, leather, or glass. Finally, the pictures are fired in a Fletcher's gas furnace. The colours used in the process are all made by G. P. Emery, of Cobridge, Staffs. In this section Mr. Henry, amongst other representative exhibitors shows a number of specimens of photo-ceramic work as well as a case of "Squares," which show progressive stages of wood engraving, and half tone work, as well as a set of large transparencies. In this room, also, Captain E. H. Hils shows a series of illustrations of the determination of the refractive power of apparatus of lenses, from the rough state through all the stages up to the finished article, is well depicted in Charles Burr's exhibit.

The seventh section, which contains all the apparatus and materials for photographic work, has a good deal of notice, as the Polytechnic Institute has an exhibit here showing the photo-engraving process in all its details, whilst further on Waterlow and Son, Limited, have the most elaborate exhibit in the whole of the photo-mechanical division, the machinery for collotypes and woodbury-type printing being practically illustrated. Further on, the Swan Electric Engraving Co. have a good assortment of engravings, as well as a press for printing photo-engravings. Edward and Co.'s stand is most interesting, an account of the aluminium tripod stands which they have recently introduced, and bid fair to come into general favour. Messrs. A. and m. Zimmerman, Cross Lane, E.C., have the largest exhibit in the section, their handsome cases being filled with various photographic chemical of Schering's manufacture, the most important being hydrocyanic, pyrogallic acid, mollin, and acetic, the latter being a permanent alkali sulphite which is said to be good for small factory results. Demonstrations of the fountain air brush invented by Mr. Chas. Burdick are given thrice weekly by the inventor in this section. The most prominent exhibit, however, is the usual one, the new camera with ordinary lanterns, which is made according to Davenport's patent.

Aire and Co. have a neat exhibit of their various "Jesmon" specialties, including the plate, film holder, and bininal lantern. Amongst the other stands in this gallery it may be mentioned that Messrs. Penrose and Co. have the most complete exhibition of apparatus and tools shown, embrandishing as it does the several modern methods in mechanical studio, the most famous, and all kinds of apparatus and materials for photographic process work. Their "Elliptograph" for tracing or cutting mounts deserves attention. With regard to the historical and artistic sections of the exhibition, which are situated in the central gallery, nothing can be said, except that they are somewhat disappointing.

The Blackfriars' Photographic Company show the Anschütz instantaneous camera, for which they are well known. An old "Kodak" exhibit is by the Eastman Photographic Materials Company, is interesting when compared with the latest modification of the same make of cameras, and demonstrates the improvements and enlargements which have been introduced. The "Kodak" is also in evidence from the same firm, and the recently introduced "Kombé" is shown both in its complete form and in sections. Watson and Sons, are also represented, and R. and J. Beck, of Cornhill, are brought into prominence with their "Frem" cameras.

On the whole the exhibition is well worth a visit, as it is certainly far in advance of anything of the kind which has been attempted before.
Market Report.

Chemicals and Drugs.

[The quotations here given are in all cases the lowest net cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the trade. It is important that this should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.]

### THE CHEMICAL MARKET.

**Thursday, May 23, 1885.**

Changes in the chemical market since our last report have not been very extensive. Tartaric acid is hardly so far from quotations as fractional less. This applies also to sulphate of ammonia. Cream of tartar remains steady at unsaluted rates. With regard to potash salts, business in chlorate, both in London and Liverpool, has been very brisk, and advanced prices, however, at considerably lower. Full details will be found below:

**Acid, Carbolic.** — The market generally is very firm, and higher prices have been paid all round. Crystals especially have been in brisk demand at the following rates — 540 to 550 C., £2 per lb; 550 to 600 C., £3 per lb; 290 to 400 C. (detached crystals), 7½d. per lb. These quotations are for crystals in 2-cwt. drums. Crude 60 per cent. is quoted at 1s. 8d., with 76 per cent. at 1s. 10d. Creplific, 95 per cent., at 1s. 1d. per gallon.

**Acid, Oxalic.** — Makers maintain the price at 3½d. net ex rails, and a fair amount of business has been done at this rate.

**Acid, Tannic.** — Steady at unchanged quotations. The price for B.P. Leviss is at present 1s. 7½d. to 1s. 7½d. per lb. in 1-cwt. cases, and the market is firm at these rates.

**Acid, Tartaric.** — Somewhat easier, and quotations are fractionally less. English manufacturers now quote at 11d., with Kemble's make at 11½d., whilst for foreign brands of acid, both in powder and crystal, 11d. would be accepted.

**Ammonia Salts.** — Hardly so steady. Carbonate remains unchanged at 8½d. to 8¾d. Liquor, steady at 8d. to 8½d. Sal Ammoniac. — The quotation for first quality is maintained at 10d., whilst seconds are worth 7½d. Sulphate. A weak market throughout the week, and closing prices are 5s. lower than when last reported. Grey 24 per cent. is now worth £1 10s.

**Ashes.** — Fairly steady at unchanged rates, American being still worth 40s., with pots at 38s.

**Arsenic.** — Unchanged, and good white powder is still worth 15s.

**Bleaching Powder.** — In steady demand, and the market is green at 11d.

**Borax.** — The demand is moderate, and Syndicate prices are maintained at 20s. for crystals, with powder at 21s. Second-hand holders, however, offer at 1s. to 1s. 6d. less.

**Coal Distillation Products.** — Benzoë: 50 per cent. is steady at 1s. 10d. per lb. Carbonic acid, 15 per cent., unchanged at 1s. per gallon. Pitch firm at 38s. per ton, f.o.b. Tur: Stockholm, 21s. to 21½d. f.o.b.; Archangel, 13s. 6d.; ordinary, 11s. 6d.

**Copper Sulphate.** — Sales have been fairly advanced, and prices are somewhat advanced. Quotations range from £1 15s. to £1 16s. 10d. per cwt., according to brand.

**Cream of Tartar.** — A steady market, without any alteration in price. German makers' quotation for powder remains at 72s. on the spot, whilst best white French crystals are worth 70s.

**Mercurials.** — The current quotations for qualities up to 50 lbs., in accordance with the advance noted last week, are as follows: — Calomel, 2s. 11d.; corrosive sublimate, 2s. 7d.; red precipitate, 2s. 6d.; ditto (granulate), 3s. 2d.; white precipitate, 2s. 5d.; perrussiate, 2s. 5d.; salic. with 525, 2s. 3d. •

**Phosphorus.** — Unchanged. Wedges being quoted at 2s., with sticks at 2s. 6d.

**Potash Salts.** — Bichromate: Quotations unchanged at 4½d. to 4½d. Chlorate: A considerable amount of business has been done at advanced rates. In London it has sold very steady at 4½d. to 5d., on the spot, whilst in Liverpool 4½d. to 4½d. has been paid. Permansurate: Small Crystals offer at 50s. 6d. to 51s. Prussiate, light by Knoevenagel at the close is quoted at 58s. 6d. to 59s. 6d.

**Quicksilver.** — Importers maintain the price 27s. 6d., but in second-hand it can be bought at 27s. 6d. to 27s. 10d.

**Salt Petre.** — British refined is quoted at 50s. 6d. to the spot. In Liverpool it is worth 28s. 6d. in kegs, and 28s. in barrels.

**Soda Compounds.** — Unsalted. Bicarbonate: 27s. 6d. London, whilst in Liverpool it offers at 26s. 6d. to 27s. 8d. per 70 per cent. 28s. per 60 per cent. Prussiate, 3s. Hyposulphite, 25s. in 1-cwt. kegs (Liverpool).

### THE DRUG MARKET.

**Thursday, May 23, 1885.**

Since our last report the boom in crude camphor has continued, and a considerable amount of business has been done in China and Japan, at full and advanced rates. Trade in spices and shellac has also been very brisk. In the Drug Market proper Carthamus ipecacuanha has been selling at advanced rates, and this applies also to Tolu balsam. Generally speaking, alkaloids and essential oils are unchanged, but cod-liver oil is very firm at advanced prices. Full details will be found below:

**Caffeine.** — Little business has been done. Second-hand holders are asking 37s. 6d. for small parcels, but it could probably be bought for 27s.

**Camphor (Crude).** — Generally the market is quiet, but steady, and business is restricted owing to the advanced rates required by holders. During the week a fair amount of business has been done in Japan at 18s. per cwt., May to July delivery, and holders are now asking 15s. 6d. to 15s. 10d., c.i.f. Sales of Chinese gum have been made at 14s. 6d. to 14s. 8d., c.i.f., May to July, and 19s. is the price now required by sellers.

**Camphor (Refined).** — Unchanged, although a further advance is very probable. The current quotations for 10-cwt. lots are as follows: — Bella, 1s. 9d.; tabacchi, 4s. 15d. or 4s. 16d., 1s. 10d.; 1 or 2 cwt., 2s. 6d. or 2s. 7d.; 3 or 4 cwt., 2s. 6d. or 2s. 7d.; 5 or 6 cwt., 2s. 7d. or 2s. 8d.; 7 or 8 cwt., 2s. 5d. or 2s. 6d.; 9 or 10 cwt., 2s. 4d. or 2s. 5d.; 11 or 12 cwt., 2s. 3d. or 2s. 4d.; in 1 lb. boxes, 1s. 10d. Smaller wholesale quantities per lb. more all round.

**Cocaaine.** — Remains at the following quotations: — 100. 6d. to 0s. 6d.; from 95 to 100 ozs., 12s. 6d. for 66 ozs. over 25 ozs., 18s. 6d. These quotations are for Coca leaves, 1 oz. bottles being charged 3d. per oz. more.

**Coca Leaves.** — Since the drug sales business has been done privately in broken Tuvalu leaves of good quality.

**Cochineal.** — Quiet. Privately there have been sales of black at 1s. 3d. for old import.

**Codrine.** — Prices remain unchanged, the current quotations being 10s. 6d. to 10s. 9d., according to quantity and brand.

**Colocynth.** — Good pale Turkey apple cannot be bought under 2s. per lb., and the scarcity of these best grades is evident. Four dollars or 2s. 6d. per lb. in New York, Trianon is reported in good demand, and steady advancing rates, in sympathy with advances from prime sources of higher prices.

**Grippe (Balssaa).** — Very firm. For good bright and cloudy Mandarin 1s. 9d. is asked, and for good quality Para character 1s. 7d. is the figure.

**Galls.** — Remain quiet but steady with sales of 2s. on the spot at 5½s.

**India Flowers.** — A firm market. Hoffmann's recent quotations are as follows: — Open flowers, 42s. 6d.; closed ditto, 69s. 6d.; closed cultivated, 52s. per cwt. all c.i.f. London.
PHARMACIST IN KENNINGTON.—The once dirty old chemist’s shop in Church Street, Kensington, which would have required the pen of a Dickens adequately to describe, has assumed an entirely different appearance since the advent of Mr. Back, who evidently has no faith in “looking backward.” The face of the place is no longer a blank, but will be in the memory of your readers, had an unfortunate knack of looking after the business of his neighbours, while neglecting his own. This order of things has been reversed by the new proprietor.—Kensington News.

PHOTOGRAPHY AND THEFT.—The American Journal of Photography relates in the course of the transit of the train to the wholesale operation of New York and New Orleans, a packet of paper money was opened and its contents found to consist of chemical, the seals were broken and one had been re-sealed by thumb pressure. Mr. Carvalho, an expert in matters of identification, obtained wax impressions of the thumbs of all the officials of the American Express Company through whose hands the packet was known to have passed. The impressions were photographed and enlarged, and the thief was detected through one of them clearly agreeing with an enlarged photograph of the thumb-pressed seal.
Trade Notes.

The Liebig’s Extract of Meat Company, Limited, send the report and statement of accounts to be presented at the thirtieth ordinary general meeting of the company, on June 6. The business appears to be increasing considerably, and the balance of the profit and loss account for the year amounts to £28,316 7s.

Mr. William Stephenson, of the Liquor Casks Company, has just been the recipient of a handsome diploma of honourable mention, awarded to him by the Board of Lady Managers of the World’s Columbian Commissioners, in recognition of his skill as a designer and inventor.

Messrs. Marion and Co., of Soho Square, W., are having a stock-taking sale, which should afford an excellent opportunity of getting bargains in photographic appliances.

Messrs. Loman and Co., of 189, Gresham House, Old Broad Street, London, E.C., the makers of the “Reflex” and “Premier” magazine hand cameras, have converted their premises into a limited liability company, and are now carrying on business under the name of the “Reflex Manufacturing Co., Ltd.”

Mr. J. H. Hart, pharmaceutical chemist, Clevedon, has completed a convenient dark-room for the use of customers.

The Platinumotype Company, of 29, Bloombury Street, W.C., recommend their platinumotype paper as making the most perfect transparencies for window decorations, etc. They are also issuing a new kind of paper, pictures printed on which can only with difficulty be distinguished from photogravures.

Mr. Theodore Brown, Fisherton, Salisbury, has invented a stereoscopic transmitter which enables two dissimilar or stereoscopic views to be obtained at one exposure in a fixed monocular camera.

Messrs. A. and M. Zimmermann, of 6 and 7, Cross Lane, St. Mary-at-Hill, London, E.C., send an original bottle of Dr. Aronson’s diphtheria antitoxin. This has been tested, approved, and sealed with lead by the bacteriological department of the German Government, and is from the first supply of this kind of serum arrived in this country. The £500 State guarantee, and the medical profession can thus depend upon the quality of this important addition to the materia medica. The bottle itself bears, besides the lead seal, a label and also outside the cover, the initials and date of examination. The control bottle carried out with considerable strictness in Germany, and a special charge is made to the manufacturers, which, of course, has to be debited to the cost. A slight addition of trikresol to the antitoxin is allowed to enable the antitoxin to keep good for twelve months.

Messrs. F. Newbery and Sons call attention to a paragraph in the introduction to their revised annual catalogue, in which they say that should they, in the future, find that medicines are so labelled as to indicate whether any of their ingredients fall within Part I. or Part II. of the schedule to the Pharmacy Act of 1868, they will place the mark “(P)” against those goods.

Messrs. Burroughs, Wellcome and Co., of Snow Hill Buildings, London, E.C., supply compressed reagents for photographic purposes, which should prove exceedingly useful at the present moment of their extreme portability. The developing “tablet” includes saponigen, saponigen with quinol, pyraminophen, pyro-developer, pure pyrygallic acid, 1, 2, and 4 gars, pyrogallic acid with saponigen, quinol, and quinol with pyro. Then there are acerelator “tablets”; timer “tablets,” potassium bromide 1 g. and ammonium bromide, 1 g.; in addition to toning “tablets,” of gold compound, in tubes containing three “tablets.” Amateur photographers are advised to find these tablets give uniformly good results.

Personal Notes.

Mr. F. W. Squire, not content with earning laurels in the field of pharmaceutical literature, has just issued a carefully compiled “Publishing Register for 1893,” which forms a supplement to the annual report of the London Club, of which he is honorary secretary.

Dr. Thorne Thorne, C.B., F.R.S., has been appointed by Government to the membership of the General Medical Council in place of Sir John Simon, K.C.B., resigned.

Dr. George Savage is said to be proposed for election as Vice-President of the Neurological Society of London in the place of the late Dr. Hack Tuke.

Dr. John Murray has been awarded the Fowler’s medal of the Royal Geographical Society, for his services to physical geography, and as director of the Challenger Commission.

Mr. G. F. Scott-Elliot receives the Cuthbert Pat grant from the same society, for his explorations of West Ruwenzori and the region to the west of the Victa Nyansa.

Lord Rayleigh has been awarded the first Royal medal for meritorious service to science, by the National Academy of Sciences (U.S.A.), for the discovery of argon.

Professor Huxley’s health still continues to improve, and he is much stronger.

Mr. John Guy, Chemist and Druggist, Roeham, Cheshire, having been in business for twenty-seven years, has retired, and is succeeded by Mr. Thomas Carter.

Mr. J. S. Shearman, chemist and druggist, Key Street, Great Yarmouth, has removed to more extensive premises adjoining his old establishment.

Professor Julius von Sachs has been elected a foreign associate of the National Academy of Sciences. His membership of the Academy is restricted to one hundred and fifty foreign associates.

Company Business.

Valdene Chemical Company, Limited.—Registered with a capital of £4,000 in 12 shares, by Jordan and 120, Chancellor Lane, W.C. Object: to carry into effect an agreement expressed to be made between E. E. Postle and F. R. Maggs of the first part, G. H. Hall and F. R. Maggs of the second part, and this company of the third part, to carry on the business of a pharmaceutical chemist, druggist, patent medicine, and perfumer, carried on under the firm or style of “James Selkirk and Co.” by James Selkirk. The registered office is 7, Pembroke Street, Calcutta.

Munster Drug Company, Limited.—This company was registered with a capital of £3,000 in 12 shares island. Object: To acquire, take over as a going concern, and carry on the business of a pharmaceutical chemist, druggist, patent medicine, and perfumer, and carry on under the firm or style of “James Selkirk and Co.” by James Selkirk. The registered office is 7, Pembroke Street, Calcutta.

Maw’s Drug Company.—Registered in Scotland with a capital of £1000 in 21 shares, by J. Maw. Object: To sell medicines of all kinds, including patent medicines; to sell and keep open shop for retailing, dispensing, or compounding persons or medicines, and generally for carrying on the business of a pharmaceutical chemist or dispensing druggist; to manufacture and sell (wholesale and retail) all drugs and poisons, and aerated waters, medicines, etc. The registered office is situated at 178, Union Street, Aberdeen.
**PRACTICAL TRADE RECEIPTS.** Must be latest edition and in good condition.—State price to Ellicott, Coldstream, N.B.

No. 2 FERRA CAMERA. State condition and lowest price. Also good microscope. State price, power, maker, and date.—J. F. Smith and Co., Calverta Square, Stockton-on-Tees.

**Year-Books of Pharmacy, 1881 to 1889.**—J. F. Liverenga, 292, Rotton Park Road, Birmingham.

**GUN-MASTERY VULCANISE.** Must be complete and perfect. Bent glass counter case about 5 feet long; also upright to open at back, about 3 feet by 2 feet 6 inches.—Collins, Duke Bar, Burnley.

**OFFERED.**

**PHARMACEUTICAL JOURNAL.** Twenty-seven volumes, half calf (1841 to 1868); perfect condition; cheap. Offers wanted.—Rowan, 'The Old Pharmacy,' Bradford.

**SELF-WEIGHING MACHINE** for customers; capital advertisement: 70s. Working model for window, about 3 feet high; cost £2 12s. 0d.—F. O. R. (approval), cash to Ozen, Chemist, Newcastle, Staffs.

Gold Bronze, 7 lb., 5s. per lb., free. Circular stand with marble top and centre pedestal for aquarium, three turned legs, with triangle base, polished mahogany, in capital condition, 15s. packed. Twenty-two pamphlets on advertising, with illustrations of electors, etc. 2s. free.—W., 44, Howard Street, Salford.

**SOLID SPANISH MARGOON MEDICINE CHEST,** fitted with escutcheon, six and a half articles, 22½. Also a well-made beechwood upright show-case, 213½. 12s. cost double; also six dozen stopped rounds, all sizes, solid labelled.—3, St. George's Circus, Southwark.

**PORTABLE ASSAY BALANCE,** with rider to carry 2 grammes each pair, 15s. 11d. Milligram balance, fitted in mahogany case. New to order. Received too late for customer.—Allen, Chemist, Plymouth.

**Books.**—Vine's Students' Text-Book of Botany, 27th, new, 4s. 6d.; Mutin's 'Short Manual of Analytical Chemistry,' 5s.; Nagelli and Schwander's 'The Microscope in Theory and Practice,' 4s.; Prantl and Vine's 'Elementary Text-Book of Botany,' 5s.; Struabeger and Hillhouse's 'Handbook of Practical Botany,' 5s.; Puslovsky's 'Principles of Pharmacognosy,' 5s. All latest editions and in good condition.—in pharmacos, 0-1 Richard- son, 4, Great Queen Street, W.C.

**HALL'S 'EIGHT-GUNNA TYPE WRITER,'** in perfect condition. Take in part exchange latest editions of Squire's 'Companion' and 'Extra Pharmacopoeia.'—John F. Bentley, Chemist, North Street, Goole.

**Books.**—Mohr and Redwood's 'Practical Pharmacy; Parry's 'Chemical Manipulation'; Turner's 'Elements of Chemistry,' 7th ed., by Liebig and Gregory; Bell and Schmidt's 'Chemical Analysis'; General View of Writings of Linneaus, by R. Pulteney, to which is annexed the Diary of Linneaus, written by himself (1806); 'Physiological Chemistry,' by Lehmann, 8 vols. (Cavendish Society); Atlas of above, by Otto Funk; 'Life and Works of Cavendish'; 'Life of Dalton,' by Dr. Henry.—Offers to Rose, Chemist, Jarrow.

**'THE CHEMIST AND DRUGGIST,'** from 1887 to 1891 inclusive; also from July to December, 1893; 11 volumes 8s. 6d.—Address, W. Gyles, 44, Guildhall Street, Folke- tones.

**DOBSON'S BLACK-LEG DRINK, 3s. 5d.; 12s. 6d.; 38s. 6d.;** good condition, 28s. the lot, or offer for part.—Wright, Chemist, Hebden Bridge.

**BOOKS.**—Squibb (1894, 1895), Bentley, Mutin, Wills, Microscope, Dispensing. Stamp for particulars. Also Botanical Lens, three in frame, representing six powers. Cost 4s. 6d., offered 3s. 6d.—G. Crosby Road, North, Waterloo, Liverpool.

A RUDGE TRI-CYCLE to be sold cheap, solid tyre, ball bearings, 23 10s.; worth double. Also two oil tanks, 100-gallon capacity, with lids and taps.—Smith, chemist, St. Helens.

**ATTFIELD'S CHEMISTRY, splendid condition, 4s. 6d., or exchange any book on pharmacy, Wills' preferred.—Slack, 151, High Street, West Bromwich.**

**POTASS. PERMANO.**—Five 7-lb. parcels at 5s. 9d., or 17s. 6d. if taken together. Large cup sponge, 7s. 6d., cost 12s., splendid value; cash with order, carriage forward.—Eastman, Forest Lane, Stratford.

**'KODAK' HAND CAMERA; Hand-some specie jar on stand; Dispensing scales on stand. All in good order.—Inglis, Chemist, Delph.**

**TUMES.**—Bed bath, syringe, inhaler, spinal ice bag, several pieces of crockery in good order. Any reasonable offer accepted.—Hyde, 8, The Green, Ealing, W.

CARRIAGE RIDING AS "EXERCISE"; THE "OMNIBUS CURE."—Parvile contradicts the received impression that riding in a vehicle is not beneficial exercise. He quotes a case which recovered by this treatment. The worse the construction of the vehicle the better for the patient; a country waggons is excellent for many cases. Doubtless walking is preferable, but where this is impossible, carriage or omnibus riding is a good substitute. Rev. Int. Med. et Chir.

---

FISH AND ARTIFICIAL MUSK.—A chemical works on the banks of the Rhone, in the canton of Geneva, is devoted to the manufacture of artificial musk, and it is found that the fishes, more especially the trout, in the river, which are caught in the neighbourhood, have a musky savour. Anglers know that the essential oils of anise and lavender attract fishes, foxes, and other animals. Has musk a similar effect, and do the fishes in this case eat the musky residues which are thrown into the river or become tainted with them through the water?—Globe.

**Microbes and Man.**—It has really seemed, as twice, as if man were on the verge of understanding diseases, and of being able to prevent them. To see how far we are still from this alarming success of nature, there is a story being told of a well-known physician who actually attempted to carry it out on his own child. Railway carriages, park seats, croquet places, empty food and clothing, all the normal cases of infant diseases were carefully avoided by the over-anxious parent, the condition of life being antiseptic. And now the poor little thing, with a material for ordinary microbes consumed, left to itself in its system, is seized with a totally inexplicable disease of its own. Truly nature is and will not be mocked!—Pall Mall Gazette.
Photography for Chemists.

The next special article on this subject will appear in next week's Supplement, and will treat of the construction and arrangement of a convenient dark-room for chemists, the text being illustrated by drawings. Photographic queries or requests for special information, received sufficiently early in the week, will be as far as possible dealt with in the same number.

Late News.

MIDLAND PHARMACEUTICAL ASSOCIATION.

The annual meeting of the Midland Pharmaceutical Association was held on Wednesday evening at Mason Science College, Birmingham, Mr. R. Darton Gibbs (President) in the chair. Amongst those present were Messrs. W. Jones, A. Southall, F. H. Alcock, F.I.C., J. Barclay, B.Sc.; G. E. Perry (hon. sec.); C. Thompson, F. H. Prosser, F. T. Gibson (Leamington), etc.

ANNUAL REPORT.

In the annual report the Council pointed out that the number of members is 172. The chief matter brought under the notice of the Council during the year had been the inauguration of classes in chemistry at the Midland Institute for pharmaceutical students. The classes had met with the support of a goodly number of students, who had expressed themselves as well satisfied with the work so far accomplished. Questions of trade interest had been under consideration by the Council, and more particularly the vexed one of company trading. There had been no calls made upon the benevolent fund during the year. The books added to the library were the 'Year-Book of Pharmacy,' from the Conference authorities, the Pharmaceutical Journal and the 'Calendar of the Pharmaceutical Society,' from the Pharmaceutical Society, and the 'Hand-book of Bacteriology' from the authors (Drs. Kantack and Drysdale). In conclusion, the Council expressed the hope that in future sessions a larger number of members might be found to actively participate in the work of the Association. The financial statement showed that there was a favourable balance of £14 18s. 9d.

The Chairman moved the adoption of the report, and in doing so said that probably matters had been too quiet during the year for the well-being of the Association. The papers that had been read were of exceptional interest to pharmacists, and therefore it was exceedingly regrettable that the attendances had been so small. The social side of the Association had been very successful, and he hoped the attention he had drawn to the fact would stimulate members to greater enthusiasm on the scientific side. With reference to the pharmaceutical classes, he had, on behalf of the Association, expressed to Mr. Woodward approval of them from an educational standpoint, but if they were merely intended as coaching
lasses or cramming classes for crowding young men through the pharmaceutical examinations they were distinctly opposed to them. He hoped that when they considered that their doings were watched by those outside their Association they would awaken to greater enthusiasm and do all they could to maintain the value of their Association.

Mr. W. Jones seconded the motion, and said that he fully agreed with many of the things the President had said, and congratulated the Association on its financial position.

Mr. A. Southall in supporting the motion, regretted that the lectures had not been better attended.

Mr. C. Thompson and Mr. F. H. Alock also supported the motion, which was carried.

In the election of the new Council the retiring members of the Council were re-elected.

On the motion of Mr. C. Thompson, seconded by Mr. J. Barclay, a vote of thanks was passed to the President and the Honorary Secretary, who briefly replied.

THE ANNUAL SUPPER.

The annual supper was afterwards held at the Grand Hotel, under the presidency of Mr. R. Darton Gibs, when there was a fair assembly of members.

After the loyal toast had been honoured, Mr. F. T. Gibson proposed "The Pharmaceutical Society," and coupled it with the names of Mr. A. Southall and Mr. C. Thompson.

Mr. Southall, in reply, said that since he had been a member of the Council he had been very much pleased with the working of the Society. It did not do as much as it might perhaps, but it did more than many outsiders imagined. Since he had been on the Council he had seen a good deal more of the working of the Society than he previously had, and he could say that it had done a great deal in the way of prosecutions. They could not publish all they did, because it would be libellous, but they had done much in the way of disturbing the grocer in the sale of patent medicines, and what they wanted was more combination amongst chemists to prevent the sale of patent medicines containing poisons by unregistered persons.

Mr. Thompson also bore testimony to the excellent work the Society had done.

Councillor Barrett (Leamington), proposed "The Midland Pharmaceutical Association," and said that the Pharmaceutical Society and the Midland Pharmaceutical Association were not doing the work they demanded of them. They were told it was their own fault. He did not deny that the Midland Pharmaceutical Association had done good work, but it did not do the whole work they demanded from it. He counselled them to approach all their parliamentary representatives for the purpose of getting that protection for their craft to which they were justly entitled.

Mr. Smith (Leamington) supported the toast, and urged the members to obtain from all the parliamentary candidates a pledge as to whether they would or would not support an amendment of the law affecting chemists.

The President, in reply, said that if the Association had failed it was not due to the members of the Council, who had devoted many hours to the consideration of subjects associated with their craft, and endeavoured to devise remedies for the evils that were said to exist. If there was a lot of evils existing, someone outside the Council would have come forward and said so, but, instead, not a single member of that Association had come forward during the year to raise a finger against the Council or complain of its work.

Mr. Perry also replied.

FEDERATION OF LOCAL PHARMACEUTICAL ASSOCIATIONS.

The following letter is now being issued to President of Local Associations and others:—

May 26th, 1919.

Dear Sir,—We have pleasure in sending you herewith copies of Rules, which will be proposed for adoption at the 3rd Annual Meeting of the Federation to be held at Bournemouth in July next.

Will you kindly bring them before your Association for discussion with a view of appointing a delegate?

A reply at an early date will oblige.

Yours faithfully,

H. KEMP, President (Manchester Pharmaceutical Association).

W. F. CUBBINS, Vice-President (Glasgow and West Scotland Pharmaceutical Association).

CHAR. SYMES, Ph.D. (Liverpool Chemists' Association).

CHAR. A. BOLTON (Nottingham and North Derbyshire Association).

CHAR. THOMPSON (Midland Pharmaceutical Association), Hon. Secretary, Sparkbrook, Birmingham.

RULES.

1.—That this Association shall be called "The Federation of Local Pharmaceutical Associations of Britain."

2.—That it shall consist of Representatives for properly constituted and subscribing local Pharmaceutical or Chemists' Associations in England, Scotland, Wales. Each Association shall have the right to appoint one delegate for every fifty members who paid their Annual Subscriptions for the current year.

3.—That the objects of the Federation are:—

(1) To establish more intimate communication and cooperation between Chemists generally, and Associations in particular.

(2) To unite, advise, and assist in the promotion of local combinations.

4.—That the Executive Committee shall consist of President, Vice-President, Secretary and Treasurer, three others appointed at the Annual Meeting, to form a quorum.

5.—That every Local Association shall pay as a Subscription of 10s. for each delegate appointed, on the 1st of January in each year.

6.—That the delegates shall pay their own expenses when attending the meetings of the Federation, and cases when special journeys have to be made, or special services have been rendered, when a grant is made by the Executive Committee.

7.—That the Annual Meetings, subject to the approval of the Executive Committee, be held in the same, and during the same week as the Annual Meetings of British Pharmaceutical Conferences.

8.—That representatives in constituencies in which there is an established Pharmaceutical Association may become subscribing Members of the Federation on payment of an Annual Subscription of 5s., and shall have the right to vote at the Annual Meeting, and shall be eligible to office the same as an accredited delegate.

9.—All delegates of Local Associations attending the meetings of the British Pharmaceutical Conference shall attend the Annual Meeting, and, with the sanction of the chairman for the time being, take part in the discussions.
PHARMACEUTICAL JOURNAL SUPPLEMENT.

10. — These rules shall not be altered except at an annual Meeting.

HERBERT SPENCER ON THE MEDICAL ART.

In continuing, in the pages of the Contemporary review, his studies of professional institutions, and in printing their evolution with evolution at large, Mr. Herbert Spencer deals this month with the physician and surgeon. In primitive societies, he points out, the functions of the medical man and the priest are combined. His arises from the fact that primitive people are very apt to believe that diseases, when not caused by angry gods, are the work of indwelling demons, who love either to be driven out by making the body an intolerable insence, or expelled by superior spirits who are invoked.

While the medicine man is distinctive of small and undeveloped societies, the priest proper arises along with social aggregation and the formation of established overmen. This continuity of belief and usage, he declares, is even still shown in the surviving interpretations of certain diseases by the church and its adherents, and it is still traceable in certain modes of medical treatment and certain popular convictions connected with them.

He notes that disease is caused by a demon that must be driven out continued, Mr. Herbert Spencer says, until spent times to give a character to medical practice, and nowadays still influences the conceptions which many people form of medicines. The primitive medicine man, hinting to make the body an intolerable habitat for the demon, exposed his patient to this or that kind of alarming, painful, or disgusting treatment. He made before him dreadful noises and fearful grimaces, or subjected him to an almost unbearable heat, or produced under his nose stenches, or made him swallow the most bominable substances he could think of. Not only during medieval days, but in far more recent days, the efficacy of medicines was associated in thought with their disgustingness; the more repulsive they were the more effective.

Having traced the separation of medical from ecclesiastical functions, a process he calls primary differentiation, Mr. Spencer follows the course of further sub-divisions or secondary differentiations, as in the separation of physicians from surgeons and the formation of associations designed to keep unqualified persons or ruffians from the exercise of the healing art. —Daily News.

A PALATABLE PRESCRIPTION.

The invitations to the sixteenth annual session of the Kansas Pharmaceutical Association, held at Leavenworth, May 21-23, 1896, were sent out in a distinctly ornate style, being in the form of a prescription, thus: —

For K. P. A. Members and Friends.

First Session... 10 o'clock a.m. Address of Welcome — R. J. Brown's President's Address — H. H. Hettenger's, 25 min. Fort Leavenworth and Military Drill... 3 hrs. Informal Reception — Chippewa's... 4 hrs. Games, Boating, Contests, and Prizes... 1-2 p.m. Old and New Officers... 2 p.m. Opera House Entertainment... 2 hrs. Papers, Discussions, and Railroad Certificates etc. 5d. L. Sig. Take three hours, in Leavenworth, three times a day for three days. Repeat in one year.

A printed note accompanying the above, issued by the Sunflower Pharmaceutical Association, Leavenworth, runs as follows: — "If you are in doubt about this prescription bring it and $1.00 to Leavenworth. The Sunflower Pharmacists there assembled will help you out of the difficulty. If you take this according to directions your relief from ennui will be immediate and your care permanent."

BRITISH ASTRONOMICAL SOCIETY.

A meeting of the British Astronomical Society was held in the Mathematical Theatre of University College, Gower Street, on May 29, Mr. E. W. Maunder (President) in the chair. A communication from Mr. Ledger was read by Miss Everett, one of the Secretaries, making various suggestions with reference to the Solar Eclipse Expedition of 1896. The writer observed that those members who wished for only a spectaculaire view of the eclipse could do so very well at Bodo, on the west coast of Norway, but it would not be worth their while to take heavy telescopes, or to set up instruments there, as the sun would be very low and bad for telescopic observation. Those who desired to make scientific observations would be well advised in selecting the Warnanger Fjord on the east coast. The President remarked that the east coast expedition was the one of real value for scientific observation, that proposed for the west coast being of minor importance compared with it. — Mr. E. Holmes read a paper on the reproduction of astronomical drawings, in which he insisted on the great care which should be exercised in avoiding those finishing touches which are likely to destroy the truth of the original. — A paper was also read by Professor Turner on simple apparatus for measuring stellar photographs. — Afterwards a general meeting of the members was held, at which certain alterations of the Rules of the Society were considered. — Standard.

Terms for Subscription to the Pharmaceutical Journal.

The Pharmaceutical Journal circulates amongst Pharmacists in Great Britain and Ireland, France, Germany, Austria, Italy, Russia, Canada, the United States, South America, India, Australasia, South Africa, etc., and is therefore specially adapted for all Advertisements to the Drug Trade at home and abroad. The average number of copies printed weekly is 7,000.

The Annual Subscription, commencing at any time and including postage to any address throughout the world, is 10s. 6d.

For the convenience of subscribers, a table showing the sums payable in Foreign Currencies for one year's subscription (including postage) is appended:

Advertisements and Subscriptions should be addressed to the Publishers, 5, Serle Street, Lincoln's Inn, London, W.C. Postal Orders should be made payable at Lincoln's Inn, W.C., to STREET BROTHERS. Cheques should be crossed "London Joint Stock Bank."
Potash Salts.—Bichromate: Steady at 4½d. to 5d. per lb. Chlorate: A very brisk market, and a large amount of business has been done at advanced prices. Potassium nitrate is quoted at 5½d. per lb. Sodium salts, in both cases, are being sold at 5d. per lb.

Quick Silver.—On the 24th inst., importers advanced the price for a bottle, the official rate being 2s. 6d. In second hands it can, however, be bought at 2s. 6d.

Salt Petre.—British refined is worth 2s. 6d. to 3s. 6d. on the spot. In Liverpool it is quoted at 2s. 6d. in bags, and 2s. 6d. in barrels.

Soda Compounds.—Unaltered. Bicarbonate, 2s. 5½d. is London, whilst in Liverpool it is offered at 2s. 5½d. Caustic soda, 70 per cent., 2s., with 1s. 6d. paid for 60 per cent. Crystals, 3s. 6d. Hypophosphite, 2s. 5½d. in 1-cwt. lots (Liverpool).

THE DRUG MARKET.

THURSDAY, MAY 30, 1856.

There was more animation at the drug sales to-day, and the tone of business generally was somewhat improved. A considerable amount of crude camphor, both Chinese and Japan, sold at high prices, and the large amount of wormwood offered generally met with a good demand. Full details of the various articles of interest are given below:

Agar.—The market for this drug is firm today. These were all Turkey sorts, and were bought in at 5s. to 5s. 6d. for hard glassy, mixed gum, part amber.

Aloe.—East Indies was in but moderate supply, and was bought in at the full rate. Aloe, soft, and 5s. 3d. per cwt. for good bright hard, 2s. 6d. for fair, and 1½d. for dull drossy quality. Zanzibar, with no enquiry, 21 cases in quotation in buyers at 6s. 8d. for medium, part softish, of fair colour, and 4s. 6d. for dry grades.

Ambergris.—Four tons only were offered. These were all bought in. Good yellow lump being held for 8s. 6d. with greyish lump of fair flavour for 7s. 6d.

Ammomum.—Very firm: 18 packages only were offered; of these 3 cases of park blocky gum, very mixed, sold at 35s.; 1 case of good small grain at 40s.; 1 case of good small grain at 40s.; the remainder was bought in at 35s. to 35s. 6d. for seedy, partly blocky gum.

Aniseed.—A single bale of fair quality Spanish at 4d. per lb. was sold at 5s. 6d. per cwt. The remainder was bought in at 5s. 6d. per cwt. Annatto Seeds.—No enquiries. Good bright Madras seed was bought in at 4½d.

Anise.—A parcel of 50 bales of Colombo—were bought in to-day at 20½d. per lb. Anise,—Very firm, owing to the scarcity of supplies, and good white powder cannot be bought under 15s. 3d. to 15s. 6d. Higher prices are quoted at steady rates.

Ashes.—In steady demand at unaltered rates, American being quoted at 40s., with Pots at 35s.

Ashes.—Very firm, owing to the scarcity of supplies, and good white powder cannot be bought under 15s. 3d. to 15s. 6d.

Bleaching Powder.—Continues to be good demand at steady rates. In London the price is 27s. to 27s. 6d. whilst in Liverpool the quoted rates are still 27s. 10d. to 27s. 15½d. f.o.b.

Borax.—Unchanged, but in moderate demand. Convention prices are still 20s. for crystals with powdered at 21s., but in second hands it is offered at lower rates.

Coal-Oil Distillation Products.—Benzene 50 per cent. is 1d. down, and the quoted rate is 11d. per gallon; 90 per cent. is unchanged at 12s. per gallon. Pitch is firmer at 55s. 6d. per cwt. whilst Tar is a trifle dearer at 11s. 6d. per barrel of 40 gallons.

Copper Sulphate.—Very steady, and a fair amount of business has been done at the unaltered rates of 17s. to 17s. 6d. according to brand.

Cream of Tartar.—Hardly so firm, and lower prices have been in some cases accepted. At the close, however, German makers are again quoting powder at 7s. 6d. on the spot, whilst fine white French crystals are worth 7s. 6d.

Mercurials.—The quotations are at present unchanged at the undermentioned rates, but owing to the advance in quicksilver, a corresponding all-round rise in mercurials is probable. For quantities up to 56 lbs. the prices are:—Colomel, 2s. 6d. per cwt.; Sanguis, 3s. 7½d.; red precipitate, 3s. 2d.; tincture (levigated), 3s. 2d.; white precipitate, 3s. 2d.; perlsulphate, 2s. 5½d.; sulphur with sulphur, 2s. 7½d.; mercury with chalk, 1s.

Cawthorn.—At 3s. 6d., 8s. for 40 lbs. and 11s. 6d. per cwt. for smaller quantities.

Caustic Lime.—At 3s. 3½d. per cwt. for small quantities.

Cinemon.—On the 26th inst., importers advanced the price for a bottle, the official rate being 2s. 6d.

Copper.—On the 26th inst., importers advanced the price for a bottle, the official rate being 2s. 6d.

Copper.—On the 26th inst., importers advanced the price for a bottle, the official rate being 2s. 6d.

Copper.—On the 26th inst., importers advanced the price for a bottle, the official rate being 2s. 6d.

Copper.—On the 26th inst., importers advanced the price for a bottle, the official rate being 2s. 6d.
Cassia Fistula.—Thirty-two bags of good bold pods were bought in at 2s. 10d., after a bid of 1s. 5d. on 29th.

Camphor. At the dark sales on the 29th ult., only 1400 packages were offered against 8114 at the preceding auctions. The majority offered consisted of East Indian bark, which sold at fairly steady rates, the average limit being 1s. 5d. to 2s. 5d. per lb. The current rates are now as follows:—For 100 oz. 10s.; from 25 to 100 oz., 16s. 3d. and for 10s. over 50 oz., 1s. 6d. These rates are for Camphor gum, and are very steady and strong.

Calumba.—Moderate supply only. Good yellow washed sort was bought in at 2s. 5d., the limits being 2s. 10d. Two bags of ordinary small pods sold at 9s.

Camphor.—The market is very strong at steadily advancing prices. At the close China has been selling for arrival May to July steamer at 1006., c. f. Holders of Japan are making 170s. c. f.i. or also May to July steamer. A considerable amount was offered at the drug sales to-day, and was all sold, 15s. being paid for China, and 16s. for Japan.

Camphor (Redined).—The refiners' prices are unaltered, the current quotations for 100 cwt. lots being 1s. 9d. for bells and flowers, with squares at 1s. 10½d., and proportionate rates. At the sales to-day 23 cases refined were bought in at 1s. 8d. to 1s. 9d. and one lot, 16s. 6d., being sold at 1s. 7d. Two cases German were bought in at 1s. 10½d., another parcel being sold at 1s. 7d.

Cannabis Indica.—Sixty-one packages were offered, of these a parcel of rather stalky seaside tops were bought in at 2s. 6d., and 20 bundles of very stalky brown tops were sold at 1d.

Chantaheredes.—Five cases of Russian flies were bought in at 8s., whilst Chinese was also withdrawn at 1s. 10½d. for fully smoked dry stuff.

Cardamoms.—In moderate supply only to-day. The prices were as follows:—Oeyon-Mysore: Medium to good price, 2s. to 2s. 6d.; small to medium pale, 1s. 6d. to 1s. 10½d.; the current rates are now as follows:—For 100 oz. 10s.; from 25 to 100 oz., 16s. 3d. to 1s. 6d., damaged by water and smocks, 1s. 4d. down to 10s., according to size and condition. Sed was lower, and sold at 1s. 8d. to 1s. 10½d.

Chervine.—Quotations remain unchanged at 10s. 3d. to 10s. 6d., according to quantity and brand.

Colocynth.—Turkey: Seven cases only were offered to-day. These were broken Spanish apple, and were bought in at 1s. 15½d. Good qualities are scarce, Turkey at 1s. 6½d.

Copaba.—Good pale Maraham sold at 1s. 9d. to-day.

Coriander Seed.—Calcutta seed was in plentiful supply, and was all bought in at 9s. to 9s. 6d.

Cumin.—No quotations were noted. Good brown Singapore and Bombay berries were bought in at 45s. to 55s.

Cumim Seed.—Mogador seed was all bought in, the limit being 29s.

Dracon's Blood.—Only the lump gum was offered to-day, and the best qualities were all bought in. Two cases fair damp, drossey block sold without reserve at 25 5s. and two cases of fair seedy lump at 25s. 9d. Fine bright flary gum was bought in at 21d.; ditto, part seedy, 210 10s. down to 20 10s. 6d. fair dark smacks.

Cocaine.—On the 29th ult., the manufacturers again lowered their quotations, on this occasion 1s. 6d. per oz., instead of 1s. 8½d. The current rates are now as follows:—For 100 oz. 10s.; from 25 to 100 oz., 16s. 3d. and for 10s. over 50 oz., 1s. 6d. These quotations are for Cocaine in tins, 1-oz. bottles being charged 9d. per oz. more.

Coca Leaves.—Seventeen bags Prokon Trans Culoram leaves of the best quality were sold on the 29th at 1!s., the limit being 1!s. 6d. It is in very fair condition, but 1!s. 6d. was the best bid.

Erem Gum.—Sirmer. A parcel of 35 cases of fairly clean pale gum sold freely at 25s. to 28s.

Erythroxylum.—Five bags new Spanish ergot sold to-day.

Fennel Seed.—Twenty bags sold at 21s. subject.

Galbanum.—Dusty gum, partly blocky and seedy, was bought in at 1s. 6d., a bid of 1s. being refused.

Grasses.—The case of fair mixed flake, price of fair flake sold at 29s to 29s. 5d. The remainder was bought in at the rates of 210 10s. for mixed pipe of good colour and fracture down to 27s for dark drossey mixed block.

Grastee Gum.—All bought in at 7s. 6d. to 9s. 6d., according to quality.

Gualacum.—A parcel of 30 cases met with good demand, all being sold at rates ranging from 2s. 8d. for good bright gum, clean fracture, and 1s. 6d. to 2s. ordinary to low drossey black.

Guyana.—In good condition. Jamaica especially sold well at 19s. up to 32s.; and 13s. 6d. to 19s. for inferior qualities. Five large fine white Frisco honey sold at 2s. 6d. to 3s. 6d. per lb., and it is very scarce, no fresh arrivals having come to hand. For small quantities, 3s. 6d. is the price. To-day, Rio roo sold somewhat better at 1s. 9d. Ordinary very dirty sound root fetched 8s. 9d. to 4s. 6d. per lb., and thin d daghanced to fine bold picked realised 8s. 9d. to 4s. 9d.

Jaborandi.—Twenty-three bales were offered, but none sold. For a parcel of ordinary leaves, a bid of 8s. was submitted. The other lots were bought in at 8s. to 1s.

Kola.—Very steady. Bold brown West Indian nuts sold at 1s. 10½d. fair brown, 1s. 7d. The remainder was bought in at 1s. 1d. to 2s., according to quality.

Loureke.—Seventeen packages of fair Jamaican juice was bought in at 1s. 2d. to 1s. 4d.

Liquorice Root.—Ordinary unpeeled root was bought in at 8s.

Myrrh.—Eighteen cases good bright drop were bought in at 8s.

Mentha.—Remains very dull at sale ease rates. Holders offer dry white crystals at 14s. 9d. to 15s. on the spot whilst for delivery it is still quoted at 13s. 6d. to 14s. 6d. terms. To-day 4 cases sold without reserve at 12s. 9d. to 13s.

Morphone.—Is unchanged at 4s. 8d. for 1000 oz. lots, and 8s. 6d. for smaller wholesale quantities. Crystals 2s. 6d. more.

Myrrh.—Absolutely no inquiries. The only lot sold consisted of 2 bales of dark chips, which fetched 20c. Good native picked gum was bought in at 26 10s.; fair ditto, 23 10s. to 30s.; ordinary ditto, 60s. to 70s. for good gittings, 45s. 6d. to 52s. 6d., pickings, from 20s. to 30s.

Nux Vomica.—No inquiries. Fair Calombo seed was bought in at 8s.

Oil.—(Essential).—Star Anise: Remains quiet but firm at unchanged rates. The spot price is 8s. 6d. to 6s. 5d., whilst for shipment May to June it is quoted at 8s. 5d. c. f. terms. Cajuput: The present price is 2d. 9d. to 5s. per bottle. Cassiope: The price is 1s. 6½d. to 10d. and downwards. For 100 oz. 10s.; from 25 to 100 oz., 16s. 3d.; dam-

aged by water and smocks, 1s. 6d. down to 10s., according to size and condition. Sed was lower, and sold at 1s. 8d. to 1s. 10½d.

Oils (fixed and Spirits).—Oatum: Quiet but steady. 2l. 16s. 10s. is the current quotation for refined oil, according to brand and package. Cocu-nut: Dull of sale. Oil of cloves: The price is quoted at 22s. 3d. to 22s. 10d. for 100 oz., and downwards. Linseed deodor. On the spot in barrels it is now worth 2l. 8½d. higher; refined oil on the spot is quoted at 22s. 6d. to 23s. Turpentine deodor: American spirit on the spot is quoted at 23s. 2½d. to 23s. 5d. Petroleum Calamine and Disinfectant oil is now quoted at 25s. 6d. to 30s. Water white at 7½d. and Russian, 55d. to 59d.

Oil (Cod Liver).—Continues in very brisk demand, fairly steady rates have been paid for Norwegian oil; the current price being 17s.

Opium.—Persian opium continues a very firm market at leading prices. During the week 12½s. has been paid for Persian. The best quality 13s. 6d. to 14s. seconds ditto 10s. to 11s. 6d. Second sheet is 8s. 6d. to 10s. seconds ditto 8s. to 9s.
Company Business.

BOUTLY'S INDIAN DRUG COMPANY, LIMITED.-Registered on May 20 by Prince and Plumbridge, 9, Fleet St., E.C. Capital, £20,000 in £1 shares. Object: To manufacture and deal in a certain proprietary medicine known as Boutly's Indian Liver Pills; as manufacturers of all dealers in patent medicines and proprietary articles generally. Registered office: 14, Castle Street, Offley Street, W.

BRITISH HYGIENIC ASSOCIATION, LTD.-This company was registered by Messrs. Waterloo and Sons, Ltd., London Wall, E.C., on May 7, with a capital of £25,000 in fifty founders' shares of £100 each, and 5000 ordinary shares of £10 each, to manufacture, import, export, sell, and deal in proprietary articles, and pharmaceutical, medicinal, chemical and other preparations. The number of directors is not to be less than two nor more than five. The subscribers are to appoint the first; remuneration, £200 each per annum.

MILTON PRINTING INK AND CHEMICAL COMPA NY, LIMITED.-Registered by Jordan and Sons, 129, Ch assery Lane, W.C. Capital £2000 in 21 shares. Object, to enter into certain agreements for the acquisition of the business of ink, chemical and oil manufacturers as may be carried on by James and Jones and Co., at Milton, Staffordshire. The directors are to be elected by the signatories. Qualifications, £50.

New Books and New Editions.

[Publishers are invited to forward full particulars of new publications, including price.]

OBJECT LESSONS IN BOTANY, FROM Forest, Field, Way side, and Garden. Book I, by Sir Edward 1, 2, 3, 4, 5, to a Teacher's Aid to a Systematic Course of One Hundred Lessons for Boys and Girls. By E. SHELBOURNE. Post 8vo, pp. 204. Price 3s. 6d. (Jarrold, London.)

THE DATA OF ETHICS. By H. SPENCER. Eighth edition, 8vo, pp. 390. Price 3s. 6d. (Williams and Norgate, London.)

LABORATORY GUIDE FOR THE BACTERIOLOGIST. By L. FROTHINGHAM. Illustrated. Royal 8vo. Price 4s. 6d. (Hirschfeld Brothers, London.)

PRACTICAL AND SCIENTIFIC AGRICULTURE. By J. MEIN. Post 8vo, pp. 322. Price 4s. 6d. (Macmillan and Co., London.)

LABORATORY ANALYSIS OF WATER, MILK, AND MEAL. By G. BROWN. Crown 8vo, pp. 20, priced. Price 2s. 6d. (Hirschfeld Brothers, London.)

INDUCTIONISTIE ARTERIO-PERICARDITIS. By T. HILD. Reprinted from the Medical Chronicle, 1894-95. Royal 8vo, pp. 69. Price 5s. (Smith and E., London.)

CALVERT'S PRACTICAL TREATISE ON DISEASES OF ARM METRIC. Eighth edition, post 8vo, pp. 54. Price 1s. 6d. (Heywood, London.)

Partnerships Dissolved.

[From the London Gazette.]

Abraham Colles and Arnold Lynden, general medical practitioners, Wellington, Somerset. Debts will be received and paid by Arnold Lynden.

John Lever and William Jones, carrying on business as manufacturing chemists under the style of Lever and Jones, at Middlesex Lane. The business will be carried on by John Lever under the style of Lever Brothers.

William Joseph Wilson and Thomas Henry Coleman, carrying on business as chemists and druggists, at 20, Temple Church Yard, under the style of the Temple Drug Stores. Debts will be received and paid by T. H. Coleman.

William Milligan and James Hamilton, physicians and surgeons, Invercargill.

Thomas Boars Johnson and Richard Theodore Wheeler, surgeons and general medical practitioners, Sturry, and Herne Bay, Kent.
Trade Notes.

MESSRS. CHEERS AND HOPKLEY, of Northgate Street, Chester, have purchased the stock of Mr. Jas. D. Bowers, pharmaceutical chemist, together with all proprietary rights, recipe and prescription books, etc., connected with his business.

MESSRS. BERCHINGO, LIMITED, of 174, Strand, W.C., submit specimens of their combined "face-smile" invoicing form and wrapper (patented), which should prove very convenient to tradesmen. The invoice is folded into a pocket behind the wrapper. The latter being attached to the invoice itself, there is but little risk of wrongly addressing an invoice, and at the same time it is easily detached by the recipient, the paper being perforated for the purpose.

MESSRS. F. NEWSBURY AND SONS think the paragraph in last week’s Supplement, referring to their annual catalogue, may be slightly misleading, since it was not stated that it is already included in the catalogue that certain articles (over 100) contain scheduled poisons. Attention had been drawn to that fact in the Journal some time ago, however. The full paragraph in the catalogue is as follows:—"As a medicine-catalogue may very properly defile which articles are subject to legal restrictions upon their sale, we have marked (P.) against those goods which we know to have been labelled "Poison." Should we, in the future, find that Medicines are so labelled as to indicate whether any of their ingredients fall within part I, or part 3 of the schedule to the Pharmacy Act of 1869, this additional information will be published as opportunity offers."

The Britannia Works Co., of Hxford, has purchased the business and goodwill of Mr. Austin Edwards, and will in future issue the photographic films and process plates hitherto made by Mr. Edwards, whose other productions will not be further issued.

MESSRS. BLENDALE, LIMITED, of York, have won an arbitration case in which the firm was the defendant. Mr. W. W. Hopkinson, of Doncaster, claimed that the firm had supplied him with inferior bird-lime for making the "Deadly Fly Trap," and claimed £2500 damages. The Official Referee, however, did not think the plaintiff had established his case, and gave judgment for the defendant with costs.

Mr. I. H. Hepp, M.P.S., writes us, in connection with his announcement on page 53 of last week’s advertisement sheet, to point out that Messrs. Hirst, Brooks and Hirst, of Allre Street, are his Leeds agents.

MESSRS. BURROWS, WELLS AND CO. inform us that they have been awarded a special First-Class Certificate for "Tabloids" of pure compressed tea at the Hobart (Tasmania) Exhibition, 1894-1895. This is the highest, and is equivalent to a gold medal.

MESSRS. INGHAM AND ROyle, LIMITED, of 53, Farringdon Street, London, E.C., ask us to note that their firm has been registered as a limited liability company, for private reasons.

MR. JAMES D. BOWERS, pharmaceutical chemist, Northgate Street, Chester, is retiring from business, and announces that all his proprietary rights, recipe and prescription books, etc., have been acquired by Messrs. Cheers and Hopkley, of Northgate Street, Chester, where the chemist’s stock will shortly be removed.

Personal Notes.

Ms. Llewellyn Jones, of Lancaster Square, Conway, has fitted up a dark-room for changing and developing plates.

Dr. E. B. Taylor has had the title of Professor of Anthropology conferred upon him by a Statute of Congregation of Oxford University.

Mr. J. B. Nagelvoort has been appointed Professor of Applied Pharmaceutical Chemistry at the Illinois College of Pharmacy.

Mr. H. Kramer, Ph.G., has been appointed Professor of Botany, Materia Medica, and Pharmacognosy, at the same institution.

Mr. Hyne Brown, Assistant Government Analyst at Hong-Kong, is Honorary Secretary to the Hong-Kong Football Club. He recently delivered a lecture on "Argon" at a meeting of the Odd Volumes Society, Hong-Kong.

Mr. Charles Nottage Mackamara, of the Westminster Hospital, has been chosen Bradshaw Lecturer at the Royal College of Surgeons for the ensuing year.

Ms. George Murray, of the Natural History Museum, Cromwell Road, has been promoted to the keepership of the department of botany, in succession to Mr. W. Carpenter, who retires on superannuation.

Advertisements in the Pharmaceutical Journal.

All advertisements must be sent to the Office, 5, Serle Street, Lincoln’s Inn, W.C., where replies to pre-paid advertisements may be addressed, and will be re-directed free of charge. Postal Orders should be made payable at Lincolns Inn, W.C., to STREET Bros. Cheques should be crossed "London Joint Stock Bank."

Prepaid Advertisements.—Advertisements of Assistants Wanted, Apprenticeships, For Sale, Partnerships, Businesses for Disposal, Businesses Wanted, and Premises to Let are charged as follows:—Fifty words or less, 3s. 6d. Each additional ten words or less, 6d.

Advertisements of a general character are inserted at 4s. 6d. each for seven lines (60 words) or less, and each additional line of seven words, 6d.

Free Advertisements.—Advertisements of Assistants seeking Engagements will be inserted Free of Charge, subject to conditions mentioned in each number of the Journal.

Calmeznss in Emergency.—Dr. Wier Mitchell, lecturing to a school of nurses lately upon the necessity of self-control in emergencies, told the following incident:—One of his patients, while in a low, nervous condition, swallowed by mistake a dose from the wrong bottle. She shrieked out that she was poisoned. One of the nurses screamed, 'sconitie!' and began to cry hysterically. The other nurse, seeing that the patient was going into convulsions from terror, when relief would be impossible, said coolly: 'Don’t be frightened. Look here,' taking a mouthful of the dose herself. She then went outside and rid her mouth of it, procured an emetic and sent for a doctor and a stomach pump. Her calmness saved the life of the patient 9 (Popular Science News).
Exchange.

[ Notices of books, apparatus, etc., for exchange, of reasonable length, are inserted free in this column. They should be written on post-cards, addressed "Editor, Department, 17, Bloomsbury Square, W.C.," and must not partake of the nature of ordinary advertisements. ]

WANTED.

'PHARMACEUTICAL JOURNAL,' February 23, 1865.—Full price will be paid by the Secretary, 17, Bloomsbury Square, London, W.C.

OFFERED.

HUMBER DIAMOND FRAME SAFETY, detachable pneumatic non-slipping tyres, plunger brake, hammock saddle, guaranteed perfect, new at Easter. Sacrifice, 27 lbs.—Pharmaceutical Chemist, 77, Welbeck Street, London, W.

MICROSCOPE FOR SALE, Beck's star, two objectives, 1 in. and 5 in.—Henry, 61, Paradise, Forest Hill, S.R.

DOBSON'S BLACK-LEG DRINK. What offers?—Row and Son, Braintree.

'CHEMISTRY, THEORETICAL, PRACTICAL AND ANALYTICAL,' published by Mackenzie, 8 parts, bound cloth, unsoiled, £10s. cost double.—Watt, Chemist, West Hartlepool.

LABORATORY FITTINGS.—For sale, at any reasonable offer, including over 100 bottles containing all ordinary metallic salts, and about five dozen reagent bottles. Full details from Simpson, Stonebridge Park, Willesden.

STEAM JACKET PAN.—Jacket and pan all copper-lined inside, with connections, holds 110 gallons. Price, £30.—Moss, Chemist, 13, Station Road, Ilkeston.

FACILE HAND CAMERA, rectilinear lens, automatic changing, waterproof cover, cost £5 12s. 6d. Adams's 8-plate changing box, cost 50s. Sell, or exchange for a 8-plate apparatus.—Green, 33, Wandastrouth Road, S.W.

SURPLUS NEW STOCK.—Sulphur tablets, 2 cwt., 8s.; 1 cwt., 8s.; 1 cwt., 8s.; 1 cwt., 9s.; under 6d. 1lb. Carriage paid.—J. M., 96, Humberstone Road, Leicester.

CHEMICAL BALANCE (Becker's), mahogany glass case, to carry 50 grammes each pan, sensible to 5 milligramme, rider, apparatus, etc., new; cost 71s. 6d. Also Stephens' Materis Medicca Collection, cost 80s. Offers to A. Edward, 82, Framfield Road, Highbury, London, N.

RICH GOLD BRONZE, 1 lb. post free for 1s. 11d., or exchange.—Hare, Chemist, Nottingham.

TOOTH FORCEPS.—Twelve in mahogany case, no worse than new, by Mather, cost 80s., cash offers (approval).—Wannop, Tow Law, Darlington.

BLOOD is most certainly detected by a spectroscopic examination and the production of crystals of haemin, but Schäfer (Zeit. für Anal. Chem.) recommends the gualacum test as still valuable. He mixes the aqueous liquid in question with tincture of gualacum (1 Gm. in 100 Gm. abs. aq.), and filters. The constituents of blood, if the latter be present, will be left on the filter with the finely divided resin. A blue colour is then produced on shaking up the filter with Hänschel's mixture (turpentine, alcohol, and chlorof orm, 200 parts each, with glycerin acetic acid and water, 2 parts each). Absence of colour proves absence of blood.

Diary of the Week.

[ Notices for insertion under this heading should reach the Editor on or before Wednesday. ]

SATURDAY, JUNE 1.

Pharmaceutical Cricket Club v. St. Mark's (Surbiton). Train leaves Waterloo at 2.5 p.m.

MONDAY, JUNE 3.

Pharmaceutical Cricket Club v. Cheam Common. Train leaves Waterloo at 10 a.m.

Geologists' Association (London). Excursion to Fenny Compton. Leave Banbury by train at 8.47 a.m.

TUESDAY, JUNE 4.

Royal Institution of Great Britain, at 8 p.m. "Thirty Years' Progress in Biological Science" (Fourth Lecture), by Professor E. Ray Lankester. Geologists' Association (London). Excursion to Hook Norton. Leave Banbury by train at 11.45 a.m.

WEDNESDAY, JUNE 5.

THURSDAY, JUNE 6.

FRIDAY, JUNE 7.

Royal Institution of Great Britain, at 9 p.m. "Phénomènes Physiques des Hautes Régions de l'Atmosphère," by Professor Alfred Cornu.

SATURDAY, JUNE 8.

Cricket News.

Muter's Versus Wills'.—This match was played at Nunhead on Saturday, May 18, and resulted in a victory for the former, the scores being, S.L. School of Pharmacy, 118, and Metropolitan College of Pharmacy, 83.
Pharmaceutical Journal
SUPPLEMENT

LONDON, JUNE 8, 1895.

Pharmaceutical Journal.
FIFTY-FOURTH YEAR OF PUBLICATION.
A Weekly Record of Pharmacy and Allied Sciences.

The oldest Journal addressing Pharmacists.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australasia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.
Publishing and Advertising Office, 5, SERLE STREET, W.C.

PUBLISHED WEEKLY, PRICE FOURPENCE.
AN AVERAGE OF 7,000 COPIES PRINTED WEEKLY.
ANNUAL SUBSCRIPTION, INCLUDING POSTAGE, 10S. 6D.

In addition to being the sole periodical publishing full and complete reports of the transactions of the Pharmaceutical Society and of the British Pharmaceutical Conference, the Journal records the proceedings of pharmaceutical and other scientific societies throughout the country, and chronicles all important advances in pharmacy and allied subjects in this country and abroad. Reviews of new scientific and technical works form an important feature in the Journal, and its pages are also open for the discussion of matters of importance to British pharmacists generally, as well as for the purpose of supplying special information desired by subscribers.

The Journal is supplied from the Publishing Office, 5, Serle St., Lincoln’s Inn, W.C., post free for twelve months to any address throughout the world, on receipt of remittance for Ten Shillings and Sixpence.

HOW TO FIT UP A DARK-ROOM.

Dark-room is, of course, a misnomer, as luckily for us we are able to manipulate our dry plates by a red light with perfect safety; and may even have plenty of red light, provided the quality is right.

To the chemist who desires to fit up a dark-room for changing plates only, a permanent room may become a great nuisance, and it is therefore shown how a corner of the shop, a room, the drug-room, etc., may be utilised. Against the wall have two 2-inch battens nailed, 6 ft. 2 in. long, and 3 feet apart. At the top of the battens drive a hole through big enough to take a stoneware and nut. Have a three-sided square, if it may be so called, as shown in Fig. 1, made of ½-inch stuff. At A drive two holes to take the screws. Each side should be just under 3 feet, that is just small enough to go in between the battens nailed to the wall. At B drive in a stout screw-eye. Now place this frame in between the battens, put in the screws, and screw on the nuts, not too tight, but just so as to allow the frame to move freely. Now in the wall, about 4 feet above the top of the frame, put in a little wheel on its screw, through which should be run the cord, as shown in Fig. 2.

We have now the skeleton, which only wants clothing to complete. Its clothes are made of black twill, lined with a double thickness, or even one will do, of yellow twill. Both these can be obtained wholesale from the Winterbottom Book Cloth Co., of 51, Aldersgate St., London, E.C. The top will, of course, be all plain salling, except that a little piece to spare should be allowed next the wall so as to pre-
fastened to the top lathes to keep it trim and tidy. To the screw-eye B (Fig. 1) attach a cord, which shall, as shown in the figure, be used to draw up and let down the dark room; at each side should be sewn small rings to fasten on to small hooks or screwheads, so as to keep the cloth close up the wall.

When required for use the dark-room can be let down by merely undoing the cord, and by fastening up the sides by means of the rings and hooks. When done with, it can be pulled up out of the way. The total cost of this, provided, of course, one has any sort of carpentering capacity, will be nominal, and doubtless some one can be found with better sewing powers than the average chemist to do the needlework. It is quite out of the way when not in use, and there is ample room for all plate changing that will be required, and a flap shelf made to let down will, of course, be essential.

We now come to the lighting of this dark-room. A paraffin or oil lamp is a nuisance, and it is therefore strongly recommended that, where possible, the dark-room should be built near a window, when a piece of used under carpets, in order to ensure no leakage of light. The principal points to be observed about this room are that the door must shut against a felted, half-inch, lined with felt, and should project half-an-inch below the floor; a key-hole will not be required, merely a stout button or hook to keep it shut from the inside. The window should be frosted with glass, the ground side inwards, then a sheet of ruby glass, and then deep orange or ruby fabric, and should be made to slide back so as to let in white light when required; outside the window should be a small shelf on which to stand a lamp at night. Accept the advice given to photographic amateurs, never put a lamp inside the small dark-rooms.

If the dark-room is to be put out in the yard or garden, then besides the flat roof have a ridge roof of corrugated iron or match-board put on, and if the latter, cover it with tarred felt. Do not have the space between the ridge roof and flat roof covered in at the sides; leave this open for ventilation. A badly ventilated dark-room becomes in summer a little Hades—it spoils the temper, spoils the negatives, and causes headaches and general lassitude; therefore always have good ventilation. This can always be secured by means of a couple of 3-inch zinc pipes, one let in close to the floor, the other in the roof, and if it be as shown herewith (Fig. 4), no light will get through.

When to be used for developing, a cistern and sink are, of course, absolutely necessary. Small cisterns to hold a few gallons, which can be fastened to the wall of the room, can be obtained from D. Allan, 157, Whitfield Street, Smithfield, W. From the same maker may also be obtained the sink, which should be lead-lined, of course, and this can be obtained with legs and stand complete. Of course a waste pipe must be provided, and beware of the homely till placed underneath the sink. This always overflows just when you are in the middle of developing, and you must either spoil your plate or else paddle around in a slop till you can open the door safely and mop the mess up. Always lead the waste pipe outside, then if there is an overflow it will not be in the dark-room.

When a sink is fitted up in a dark-room it is advisable to have a cover of wood to lay over it, thus forming a shelf or bench for changing plates, etc. A shelf or two will be handy, and should not be omitted. We now come to the light. Daylight will, of course, strike one as most convenient, and for changing plates it is all right, but for developing the use of a paraffin lamp placed outside the dark-room is strongly recommended. The light of this is practically constant, and therefore it enables one to judge of the negatives far better.

The most important thing in respect to the light is the coloured glass or medium. Glass or fabric may be used, and if you obtain a good glass, plenty of light may be used. It may safely be said, however, that from spectroscopic examination of many commercial glasses there are very few that are really satisfactory. It is preferable to make one's own light filters as follows. The method is not original, but it is very good. Three so-called aniline dyes are required—coralline rouge, fuchsin, and aurine; besides these some palma colloidion.

The colloidion is merely pyroxylon, 3 grs.; methylated spirit (the old, not the new nauseous rubbish), 1 c.; methylated ether, 3 c.; castor oil, 5 drops. At least 3 ozs. of this should be made and put into three 13 oz. bottles. To each bottle now add about 10 grs. of the dyes, one dye in each bottle, and shake thoroughly. Allow to stand some hours, and if all the

Fig. 3.

the black twill about 12 inches square can be cut away and deep ruby fabric sewn in its place. This should be about 4 feet from the ground. If the window of the room is high up, or there happens to be a skylight, then make the top of two thicknesses of ruby fabric and one of yellow twill, and this will be safe and give plenty of light.

Where the chemist himself wishes to become a photographer, or desires to fit up a dark room for developing as well, then he should have one made of match-board, as shown in Fig. 3, which can be knocked up by a carpenter at very little cost. Inside it should be lined with brown felt paper, such as
dye has dissolved, add another 5 grains and again shake. What is wanted is a saturated solution of the dye; when this is obtained allow the colloid to settle. Take three pieces of window glass of the required size and coat with the colloid. This requires some little practice, but if for a 12-inch square about half-an-ounce of the colloid be poured on to the bottle in a pool, it will be found that by letting the glass first to one corner and then to the others in turn it will flow over the whole of the glass and form an even coating, when it can be laid on a level slab to set and dry. Practising with olive oil is advisable first, and if no experience has been undergone of colloidising plates, do not attempt it in the drawing room, and do not waste it in the scullery and turn up your shirt sleeves, because generally a bigger will put as much colloid on the floor or up his sleeve as he will on the plate.

If fabric is preferred, it can be obtained commercially, as already stated, but for home make the fuchsin is soluble in water, and a strong saturated solid, the abridgment, allowed to go, and, if decanted or filtered, and well-washed calico suspended in it for an hour, then taken out and hung up to dry. Coralin rouge, also known as peonin, and the water soluble variety should be obtained, a saturated solution of this should be made, and the whole of one egg yolk added up to every 10 ozs. of water, then heated and darkened right through, then wash, and place for a few minutes in a clean fixing bath, and again wash. Of course it may be objected that the use of the second fixing bath entails a lot of trouble, but it is not permanent, and the results obtained are certainly permanent and good. For those who prefer a mercury bath—"if properly used such a bath is hard to beat"—the now well-known potassium silver cyanide intensifier commonly but erroneously called "proofen's may be made.

PREPARATION OF POTASSIUM BROMIDE [The formula and directions for working here given are specially compiled for pharmacists by a practical chemist and photographer, who will be pleased to supply any special information required, or to answer photographic queries. Letters should be addressed to Editorial Department, 77, Bloomsbury Square, W.C., with the word "Photography" in upper left-hand corner of envelope.]

A GOOD INTENSIFIER.

Intensifiers are always a trouble to amateurs; in the first place the majority contain perchloride of mercury, and this they cannot always obtain, and then they get into endless trouble with mercury intensifiers. A Simple Practical Intensifier

**Directions for Use.**—The negative must be thoroughly freed from hypo, and should be either treated with antihy or with alum and acid solution, then immersed in No. 1 till bleached right through, then washed for twenty minutes in running water, and then immersed in No. 2 till blackened through, when it should be again well washed.

If the negative is left too long in No. 2 solution the details in the shadows will be eaten out.

**ANTHION.**

The best servant and the worst master the photographer has is "hypo," the familiar nickname of hypo sulphate or the phosphat of silver. With it he has his prints, and when it becomes dirt, that is, matter in the wrong place, he ruins his negatives, spoils his prints, and generally loses his temper. How to get rid of it has always been a warning of the flesh, long washing in running water, especially constructed tanks, frequent overflows of the domestic bath-room basin, etc., and subsequent troubles with the ladies of the household are but too familiar, but now all our troubles are ended, thanks to Scheider's "Anthion." He has introduced "Anthion," which is persulphate of potash, and a few minutes' bath in this soon destroys our old enemy—"hypo." Potassium perchlorate, KCl, is a very fine crystalline powder, soluble sparingly with about 10 per cent. at 50° F. It is a stable salt when kept dry, but when in solution or exposed to the air gradually decomposes, giving off oxygen, and it is this very property which makes it valuable for destroying the last traces of

**PHOTO-CERAMICS.**—W. Ethelbert Henry, who is now giving demonstrations at the Imperial Institute on the bringing out of American pottery and china in confirmation of Dr. H. Snowden Ward's handbook on the subject, which will shortly be published by Dawbarn and Ward, 6, Farrington Avenue, at the popular price of 1s.
Hypo-sulphite, as it oxidises it into tetra-thionate of soda, according to the following equation:

$$2Na_2SO_3 + 3KSO_3 = Na_2SO_4 + 3KNa \quad \text{gives} \quad SO_4$$

From this it is evident that 224 parts of hypo require 135 parts anhydrite for complete conversion.

There have been, of course, numerous hypo-eliminators suggested, such as eau de javelle, permanganate, iodine, etc., but these unfortunately attack the silver image, whereas the hypo does not appear to do so. It is best used in a solution 1:300 as follows:—The plate or print should be washed for about ten minutes in running water, then immersed for five minutes in the above solution, the dish being constantly well agitated, allowing about 3 oz. of solution for one plate or four prints about half-plate size; the print or plate should then be immersed in fresh water for five minutes, and again treated with anhydrite, and then washed.

A very rough way to test whether all the hypo is out is as follows:—To a drachm of the last washing water add three drops of a 1:30 silver nitrate solution, probably a white precipitate of silver chloride will be formed, this can be disregarded as long as it remains white, but if it soon turns yellow or pale brown then all the hypo is not eliminated, and a further treatment with anhydrite should follow.

There should be a very good sale for this, as the washing of prints and plates is always a trouble. It may be obtained from Messrs. A. and M. Zimmerman, 6 and 7, Cross Lane, E.C.

A RELIABLE REDUCER.

Reduction of the density is an operation somewhat dreaded by amateurs, because it has generally been necessary to use two solutions, the action of which was uncertain, and which would not keep. Beltschi's solution, however, will keep indefinitely, and can be used over and over again.

Potassium ferri-o xalate .......... 1 oz.
Sodium sulphite .......... 2 oz.
Oralacid ...... 1 oz. grains.
Hypo-sulphite of soda .......... 21 oz.
Distilled water, to make .......... 10 1.

The above-named potassium ferri oxalate, which occurs in brilliant emerald green crystals, must not be confounded with ferro oxalate, which is a yellowish brown powder of the formula Fe₂C₂O₄, the potassium double salt being Fe₃C₂O₄. Dissolve the potassium salt in 5 oz. of water, add the sulphite, and shake thoroughly till it is all dissolved. Then take off the solution of ferro oxalate, to this solution add the oralacid in crystals and stir or shake till the solution turns green again, then decant from any undissolved acid, and add the large proportion of water to make the total bulk measure 10 oz., and bottle.

This may be applied to a negative irrespective of what developer was used, and also immediately it comes from the fixing bath, though it is just as well to rinse the excess of hypo off; as soon as the negative is sufficiently reduced it can be taken out and well washed as usual.

The reducer will keep indefinitely, and may be used over and over again till it becomes yellow or orange, so that the colour of the solution is a good guide as to the efficiency of the reducer. It causes no precipitate on the negatives, and it tends to harden the film, so that in warm weather it prevents frilling and blistering.

It is also suitable to hypo-sodic papers and opals or lantern slides, and its use is so simple and easy that it is difficult to see where it can go wrong, and it is a great favourite of the writer.

A STAIN REDUCER.

One of the latest claimants to favour amongst photographers is thio-carbamic or thiourea, CH₂N₂S, and as it is very efficient for removing the stains of pyro from the films of negatives, the fingers, clothes, etc., it should be recommended.

Thio-carbamic .......... 30 grains.
Chrome alun .......... 30 
Citric acid .......... 40
Distilled water, to make ............ 10 oz.

The negative may be washed in soapy water, then washed, and then well washed, or the hands or fingers well washed with a coarse rag djpged in the solution.

Answers to Photographic Queries.

RHEW inquires the cause of an explosion which occurred when a mixture of carbonate and sulphate of sodium was rubbed up in a glass mortar with a little water. This has been happening to do so to all intents and purposes, but can only be ascribed to sudden disintegration of the glass from some reason or other, an occurrence which has before now been noted in pharmaceutical laboratories. It also asks for information as to the rapidity of plate test suited, developer, and details of development.

It is possible to obtain a result satisfactory in every way if one or two conditions are fulfilled. The only plates to use are the so-called photo-mechanical or process plates, such as the Imperial or Ilford, or Mawson and Swan; these are very slow, requiring about four times the exposure of an Ilford ordinary. The exposure must be gauged as correctly as possible, and with F. 16 and a good light, such as is now obtainable about mid-day, the exposure would be about 10 seconds. The best developer is hydrosinoine with plenty of citrate, or else glycin.

Hydroksinos Developer.

<table>
<thead>
<tr>
<th>No. 1.</th>
</tr>
</thead>
</table>
| Hydroksinos .......... 4 grains.
| Potassium metabsulphate .......... 3 oz.
| Bromide of potassium .......... 4 grains.
| Water, to make .......... 1 oz. |

<table>
<thead>
<tr>
<th>No. 2.</th>
</tr>
</thead>
</table>
| Caustic potash .......... 10 grains.
| Water .......... 1 oz.
| Citric acid potash .......... 15 grains.

Mix in equal parts.

Glycin Developer.

<table>
<thead>
<tr>
<th>8 grains.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Glycin ..........</td>
</tr>
<tr>
<td>Sodalum sulphurite ..........</td>
</tr>
</tbody>
</table>
| Potassium bromide .......... 4 grains.
| Sodium carbonate .......... 44 grains.
| Distilled water, to make .......... 1 oz. |

This is a slow developer, but gives very clear negatives.

The main point in developing is to keep the lines clear, and to slide or print the negative, and the development should be stopped and the plate well rinsed and fixed immediately. If the exposure was correctly timed, develop it in the above solution; if it is obtained without any clogging of the lines, but if after development there is insufficient density, then the crystals intensifier may be used.

F. G. V. asks for a really good formula for a combined toning and fixing bath in one solution to put up for retail.

If there is one thing more than another which is likely to bring discredit on a dealer it is a combined bath. Amateurs will not use properly. A combined bath contains gold and hypo-sulphite, and the principle of the action of a combined bath is first to fix and then to tone. A print is prepared on paper which contains free acid, generally citric acid. Now, when an acid is added to hypo a decomposition occurs, and sulphuric acid and manganic sulphate are set free, and these, in contact with the silver salts of the image, give rise to sulphur salts of silver, which invariably lead to subsequent fading. A combined bath, if properly used, is no worse than any other, but when improperly used, well—better not print at all. Still, being asked for a combined bath, the only formula which is any way satisfactory is given:

<table>
<thead>
<tr>
<th>12 oz.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sodium hypo-sulphite ..........</td>
</tr>
</tbody>
</table>
| Potassium sulphite .......... 16 grains.
| Sodium chloride .......... 20 n.
| Gold chloride .......... 1 n.
| Water, to make .......... 84 oz. |

Dissolve in cold water.

Directions for use.—Immerse the prints removed from the printing frame in a solution of salt, 1 oz.; washing soda, 2 oz.; water 10 oz. For ten minutes, then rinse well and immerse in the toning bath. This bath will keep indefinitely, and may be used to tone an area of prints equal to 40 square inches. If used for more prints they will not be permanent.
Market Report.

Chemicals and Drugs.

[The quotations here given are in all cases the lowest net cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the parties. It is important that this should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.]

The Chemical Market.

Thursday, June 6, 1895.

Since our last report business has necessarily been restricted, owing to the Whitensibly holidays. Prices do not show any great alteration, and the more interesting features may be briefly summarised. Cream of tartar and tartaric acid are quiet, sulphate of ammonia is dearer, and chrysophanic acid is steadily moving up. Full details will be found below:

Acid, Carbonic.—A quiet market, and little business results. Crystal acid is a shade firmer, but other varieties are unaltered. Quotations—Crystals: 34° to 35° C., 55d. per lb.; 35° to 40° C., 65d. per lb.; 36° to 40° C. (detached crystals), 7½d. per lb., these prices being for bulk quantities in 2 cwt. drums. Crude: 60 per cent., 1s. 7d.; 75 per cent., 1s. 10d. Cresylic (Liquid Carbonic acid); 1s. 1d. per gallon for 95 per cent. acid.

Acid, Chrysophanic.—Manufacturers report a very firm market with advancing prices. The current quotation is now 4s. 6d. to 6s. per lb., according to quantity. Acid is still quoted at 1s. 13½d. to 1s. 2d., according to quantity.

Acid, Ozallic.—In fair demand at unaltered prices. Manufacturers quote at 3½d. net ex works.

Acid, Tartaric.—Quotations are unaltered, but the market is quiet. English brands of acid are still quoted at 11d. to 11½d. on the spot, and foreign, both in powder and crystals, at 1½d.:

Ammonia Salts.—Carbonate unaltered at 3½d. to 4½d. Liquor steady at 3d. to 3½d. Sulphate of ammonia: The price for first quality is maintained at 39s., with seconds at 37s. Sulphate is dearer, and the closest a firm market. Grey 34 per cent. is now worth £10.

Amer.—Unaltered. America is worth 40s., and pots 36s.

Arsenic.—Remains very firm, and supplies are scant. Best white powder is still worth 18s. 6d. to 18s. 6d.

Bearing Powders.—Unaltered, and in fair demand. In London it is quoted at £7 5s. to £7 15s., whilst the Liverpool quotation is still £7 10s. to £7 15s. f.o.b.

Borax.—The Syndicate prices are 30s. for crystals, with powder at 3½s. In second hands it offers at 1s. to 1½s. 6d. less.

Coal Distillation Products.—Benzoic: Unaltered, 50 per cent. is still worth 11d. per gallon, and 90 per cent. 1s. per gallon. Pitch is lower, at 30s. per ton f.o.b., whilst Tar is unaltered at 11s. 6d. per barrel of 40 gallons.

 Copper Sulphate.—A very firm market at advancing prices, ordinary brands are still quoted at 21s., but special made is worth £1 15s.

Cream of Tartar.—Easier, and lower prices have been in some cases accepted. At the close German makers of powder are quoted at 71s. to 72s. on the spot, whilst good white French crystals are worth 60s. to 70s.

Mercurials.—At present unchanged, although in view of the firmness of quicksilver a corresponding all-round advance in mercury is to be expected. For quantities up to 66 lbs. the current quotations are as follows:—Colonel, 2s. 11d.; corrosive sublimate, 2s. 2d.; red peptizate, 3s. 2d.; white ditto, 3s. 2d.; blue gill, 1s. 8d.; ditto ointment, 1s. 8d.

Phosphorus.—Very steady. Sticks are worth 2s. 1d. to 2s. 2d., and dough 2s. 6d. to 3s. 6d.

Potash Salts.—Bichromate: Steady at 4½d. to 4½d.

Chlorate: Again a firm market, and in Liverpool especially a large amount of business has been done at 5½d. per lb. In London the closing price is 6d. Permanaganate: Small crystals 52s. 6d. to 5s. Frasinate: In London it is quiet at 2½d. to 8½d., whilst in Liverpool it has declined to 8d.

Quicksilver.—Steady. Importers maintain their prices at £7 10s. per bottle. In second hands the price is £7 8s. to £7 8s. 6d.

Salt Peter.—British refined is steady at 28s. 6d. to 28s. 6d. on the spot, and in Liverpool it is quoted at 28s. 6d. in kegs, and 28s. in barrels.

Soda Compound.—Unchanged. Bicarbonate: £7 5s. in London, and in Liverpool it offers at £6 10s. Caustic 70 per cent., 28s., whilst 60 per cent. offers at 21s. less. Crystals: 32s. Hypo-sulphite: 28s. 6d. per ton in 1 cwt. kegs (Liverpool).

The Drug Market.

Thursday, June 6, 1895.

Business has been somewhat at a standstill in the Drug Market since our last report, owing to the holidays. Cocaine hydrochlorate has been again reduced in price. Essential oils are particularly unchanged. Cod-liver oil is very firm, with every prospect of advancing prices. Full details will be found below:

Amabore.—Ten cases were included in the catalogues of the last few drugs, but not having been landed were not offered. The price asked is 2s. 6d. per lb.

Arnifolin.—For European use. In second hands it can be bought for 2s. 6d. to 25s., whilst for delivery, August to September, it is quoted at 18s. It may be noted that the price has at last been withdrawn from the current quotations of the makers, although it appeared at the rate of 16s. per lb., when the spot price was still higher than even at the present time.

Campior (Crude).—Firm at unaltered rates. The quotations are:—China: On the spot 100s., and for arrival, May to July steamer, 155s. to 160s., c.i.f. Japan: For arrival, June to August, 155s. 6d. Importers quote Japan at 170s.

Campior (Refined).—English and German makers' prices are unaltered, and the current quotations for 10 cwt. lots remain at 1s. 9½d. for bags and flowers, with squares is. 10½d., and proportionate rates.

Cloves.—Quiet. Privately, business has been done in Zanzibar at 3½d., July to September delivery.

Cocaine.—The manufacturers have again lowered their prices to hydrochlorate 1s. 6d. per oz., and the current quotations are now as follows:—For 100 ozs. 1s. 6d. from 25 to 100 ozs., 1s. 8d. 9d. and for lots under 25 ozs., 1s. 5d. These quotations are for cocaine in time, 1 oz. bottles being charged 8d. per oz. more.

Cochinial.—Unchanged. There have been sales privately of black at 1s. 8d.

Codine.—Prices remain unchanged, the current quotation being 10s. 2d. to 10s. 9d., according to quantity and brand.

Colchicum.—Turkey continues scarce, as there have been no fresh arrivals. Holders ask 2s. for good apple. The price for fine Spanish remains at 1s.

Copaba.—Steady, but dull of sale. There have been sales privately of good bright Maraham at 1s. 10d. down to 1s. 6d.; Para at 1s. 6d. to 1s. 7d.; and Maracá and Bahia at 1s. 5d. to 1s. 5d.

Galls.—Quiet, but steady. There have been sales of China on the spot at 55s.

Insect Flowers.—Hoffmann's report notifies a more active demand in the Trieste market, and prices have risen about 10 per cent. all round. The current quotations are:—Open flowers, 50s. 9s.; closed-ditto, 75s.; closed-ditto, 105s., London.

Ipecacuanaalkaloids.—E. Merck, of Darmstadt, quotes the alkaloids of ipecacuanha prepared according to the researches of Dr. Paul and Mr. Cowley (vide Pharm. Journ., vol. liv, p. 111) in his prices current as follows:—Eriochlorohydrochloride cryst., 4s. 6d. per grammes; cephaline alkaloid cryst., 13s. 6d. per grammes.
**FRIEDRICHSHALL WATER.**

We record with interest the successful opening of a new spring at Friedrichshall. The world-famous Friedrichshall spring, which has been continuously worked for sport of fifty years, and was referred to by Baron Liebig as "Treasure of Nature," has of late given indications that the combination of saline deposits which gave it its rise was becoming exhausted. Boreings were accordingly made, and a new spring found, with the satisfactory result that the water drawn therefrom proves to be practically identical with the originally yielded by the old Friedrichshall spring. We follow the analysis by Professor F. Fischer of Bonn, compares with that of the old spring made by Prof von Liebig in the year 1846 —

*Parts in 1000.*

- Sulphate of Soda: 5.9461
- Magnesia: 5.9384
- Lime: 0.7408
- Potash: 0.1706
- Chloride of Sodium: 7.3112
- Magnesia: 4.7135
- Bromide of Magnesia: 0.0572
- Carbonate of Soda: 0.3188
- Lime: 0.3183
- Carbonic Acid: 0.2985
- Silica Acid: 0.0012
- Oxide of Iron: Traces
- Alumina: Traces
- Total: 25.6443

The valuable combination of sulphates of soda and magnesia (in about equal proportions) with the chlorides of sodium and magnesia constitute the chief and unique value of Friedrichshall water. This combination renders the taste of the water singularly pleasant, wholesome, and cleansing to the palate. It has for years enabled it to be used as an aperient, occasionally or habitually, with reliable and agreeable results and without violence. The results of experiments carefully conducted at a number of hospitals in Germany demonstrate that even when taken in copious quantities, the water is free from the slightest defacement to the embrace or other unpleasant secondarv effects. Unlike most mineral aperients, it is able to be always used in prolonged use, be progressively made. After a careful examination of the water, of its alkalinity and of the ascertainable results of its action as a customary aperient for occasional or continuous use, we can recommend the Friedrichshall water, as soon as it is bottled at the spring and in every respect equal to the Friedrichshall water, which, for the last fifty years, has been a well-known aperient with the medical profession as its Continent of Europe and this country. — _British Medical Journal._

**ROYAL PHOTOGRAPHIC SOCIETY.**—Since the Queen has granted the prefix of Royal to the old F.S.G.B., or Photographic Society of Great Britain, the number of members has enormously increased, and with the founding of a higher degree with the title of Fellow, and the right to use the magic letters F.R.P.S., "things are wagging. Next month the Society move into new and more commodious premises at No. 12, Hanover Street, Soho, W., their annual exhibition, which is held annually at St. Paul's East, S.W., will, it is thought, this year be better than ever, and it is always the one exhibition of the year._
Personal Notes.
Mr. Alexander Ellis, A.P.S., Chemist and Druggist, Nelson-in-Cleveland, has disposed of the business which he has conducted for the past twenty-seven years.

Mr. Walter Wright Kingston, A.P.S., who has re-chosen the stock-in-trade and trade recipes of Mr. Ellis, Skelton-in-Cleveland, will carry on the business as formerly.

Prof. Frankland has been elected a foreign associate of the Académie des Sciences, in the department of chemistry, in the room of the late Van Breden.

Lord Rayleigh has been awarded the Barnard gold medal for his discovery of argon by the trustees of Columbia College, New York, which thus follow the example of the National Academy of Sciences.

Mr. Spencer C. Blackett—formerly well-known as a publisher on his own account—has been appointed manager of the firm of Kegan Paul, Trench, Trübner and Co., limited.

Mr. George Bentley, the head of the eminent publishing firm of Richard Bentley and Son, who died at Slough on Wednesday, May 29, in his sixty-seven years, had travelled in various parts of the world and took a special interest in the work of the world. "Temple Bar" owed much of its popularity to the personal attention bestowed on it by Mr. Bentley, who was known and esteemed by many authors.

Dr. Van T' Hoff, the chemist and physicist, is to receive the Frasian Ordre de le Liberte.

Mr. Herbert Spencer, the distinguished philosopher, was to be similarly distinguished, but has decided that certain views regarding and strongly expressed opinions of his debar him from accepting the decoration.

The Selborne Society.
The annual meeting and soirée of this Society was held on May 29, at 20, Hanover Square, and was attended by a large number of ladies and gentlemen. The Earl of Stamford presided at the meeting, held in the large hall, at which the report and accounts for the past year were presented for adoption. The Chairman, in opening the proceedings, read a letter from Sir John Lubbock, regretting his inability to be present, and speaking warmly of the progress of the Society, and presented the annual Report for Adoption. The motion was seconded by Dr. Dudley Buxton, who spoke of the work of the Society in encouraging a love of nature and in following the precepts of Gilbert White. It also referred to the special labours of the branch and the methods adopted in making known the objects of the Association. Among other speakers were Mr. J. L. Otter, the hon. treasurer of the Society, and in the end the report and accounts were unanimously adopted. At the conclusion of the meeting the visitors dispersed into the various rooms to witness the display of a collection of relics of Gilbert White, lent by Mr. R. Holt White, and a Bibliographical Exhibition, arranged by Mr. J. R. L. White. Among other attractions were two "informal talks" by Mr. Holt White on Gilbert White; Mr. MarshamWatson on the protection of insects; and Mr. E. A. Martin on the "Natural History of Selborne." There were also a performance of music by the Middlesex Hospital Vocal Quartette, and a number of microscopical exhibits by the members of the Questett and the Royal Microscopical Societies.—Standard.

Trade Notes.
Messrs. Hodgkinson, Preston, and King, wholesale druggists, Bishopsgate, London, were the owners of a fire which broke out on their summit o'clock on Saturday morning last. A two-storied building lying to the rear of the thoroughfare was for the most part destroyed, and the damage done was considerable, involving the destruction of large quantities of chemicals of various kinds. No cause will be the exclusive of the order of orders, however, and the damage will be carried on by the firm the same as usual.

Mr. F. Wagner, 11, Rue du Parc-Royal, Paris, encloses samples of filter papers of Bernard Dumas' make, for which he has the concession. These papers are of a superior filtering quality, made from real rags and free from chlorine and iron. The hand folded filters are said to be much appreciated by all using them. The sole agents for the United Kingdom and Colonies are Messrs. J. L. Lyon and Co., 75, Mark Lane, London, E.C.

Mr. Edward Peck, chemist and druggist, East Dereham, Norfolk, makes a speciality of the Mount, Mount, etc., of all kinds, which he supplies wholesale. His five-guines Sarum photographic set is 4-plate size, and fitted with Sarum lenses.

The Chemists' Aerated and Mineral Waters Association, Limited, gives notice that the Extraordinary General Meeting of the members of the Company will be held at Anderson's Hotel, Fleet Street, in the City of London, on Friday, the 14th day of June, at three o'clock precisely, to consider the advisability of altering the Articles of Association of the Company by taking power to subdivide its shares, with the view of subdividing the 4,500 shares of £10 each into 45,000 shares of £1 each, and that at such meeting the following resolutions will be proposed:

"That Article 5 of the Articles of Association of the Company, which is in these words, 'The Company in General Meeting may from time to time increase the capital by the creation of any number of new Shares,' be altered by the addition thereto of the words, 'The Company may also subdivide its Shares.'"

Should such resolution be passed by the required majority, it will be submitted for confirmation as a special resolution to a second extraordinary meeting to be subsequently convened, at which the necessary resolutions for subdivision of the shares as above will be proposed, and if passed by the required majority, submitted for confirmation as special resolutions to a third extraordinary General Meeting to be subsequently convened.

The Victoria University.
The Victoria University, Manchester, conferred honorary degrees for the first time on May 29. Among those so honoured were the Duke of Devonshire, Lord Derby, Lord Kelvin, the Marquess of Ripon and the Principals of the affiliated Colleges at Manchester, Liverpool, and Leeds. In the evening a banquet was presided over by Dr. Leech, Chairman of Convocation. Lord Spencer, Chancellor of the University, presided, and the toast of the evening, spoken of the important influence of the University in the northern counties of England, and the great progress it was making. It had proved that high culture could be secured in manufacturing communities without in the slightest degree decreasing the business capacity of commercial men. It had had to contend against considerable difficulties, including that of finance, and had triumphantly overcome them all. Men of wealth could find a nobler and more admirable way of expending their riches than in promoting higher education. In this movement there had been a strong push forward from the County Councils, particularly in respect of technical education, and that technical education was largely dependent upon general education, and in general education the Victoria University was doing an invaluable work. Lord Ripon and Lord Kelvin also spoke.—Standard.
Exchange.

[Notices of books, apparatus, etc., for exchange, of reasonable length, are inserted free in this column. They should be written on post-cards addressed "Editorial Department, 17, Bloomsbury Square, W.C." and must not parrot the nature of ordinary advertisements.]

OFFERED.

LANCASTER'S MULTUM-IN-PARVO enlarging camera, to enlarge up to 10 by 8. Unused. What offers? Cash or exchange.—Davis, 7, Sidney Terrace, Weston-super-Mare. 200 £1. VASELIN TINS. What offers?—D. S. C. Reid, 156, New City Road, Glasgow.

'CHEMIST AND DRUGGIST,' a quantity of, some bound, any exchange, or small offer to cash.—F. G. Currie, 46, The Broadway, Ealing, W.

MICROSCOPE for sale; binocular; in excellent condition; objectives, 2½, 1 in., and ½ in.; mechanical stage; complete in mahogany case, including a micrometer, £2.—Simpson, Stonebridge Park, Willesden.

SAFETY.—Light, Diamond Frame Tautometer, tangan- snokes, balls everywhere, sacrifice, £2 10s.—Howard, 85, Orsett Road, Gray's, Essex.

BOOKS.—Churchill's 'Operative Midwifery,' with plates; 'Wallace on Sphylites,' 2s. 6d. each. splendid condition.—Black, 351, High Street, West Bromwich, Staffs.

BALANCE (Griffin's 6005).—Carry 100 grammes, show 1½ to 1/10 mg., steel knife-edges, agar plane, pan-stops, rider, scarcely used. Cost £2, take £6 10s.—Harey, Bilethy, Loughborough.

PORTABLE ASSAY BALANCE, with rider to carry 2 grammes each pan, turn with 0.1 milligramme, fitted in mahogany case. New to order. Received too late for customer.—Allen, Chemist, Plymouth.

WATKIN'S EXPOSURE METERS, cost 15s.; 'Tr-Fore!' Flash Lamp, 10s. 6d.; 'Photorey,' 10s. Used once. Sale, half-price.—E. J. Appleby, Pharmaceutical Chemist, Bath.

Partnerships Dissolved.

[From the London Gazette.]

Samuel Ralph Atkins and William Ralph Atkins, carrying on business as pharmaceutical chemists at Salisbury under the style of Atkins and Son. Debts will be received and paid by W. E. Atkins.

James Watson Black and George Dudley Short, carrying on business as chemists and druggists at 39, George Street, Richmond, and 78, Weston Hill, Upper Norwood, under the style of J. W. Winton and Co. Debts will be received and paid by J. W. Black.

Frederick William Kirkham and Henry Townsend Makepeace, carrying on business as surgeons at Downham Market under the style of Kirkham and Whitting. Debts will be received and paid by F. W. Kirkham.

Literary Intelligence.

MESSRS. J. AND A. CHURCHILL will shortly publish a new edition of Roxham's Chemistry, Inorganic and Organic, re-written and revised by Prof. J. M. Thomson, of King's College, and Mr. A. G. Bloxam, Head of the Chemistry Department, Goldsmiths' Institute. Several new woodcuts have been introduced into this edition, and obsolete ones omitted. The firm also announce a new and enlarged edition of Beasy's 'General Receipt Book,' comprising a veterinary formulary, recipes in patent and proprietary medicines, perfumery and photographic processes.

Company Business.

BUTE DRUG STORES, LIMITED.—Registered on May 5 with a capital of £200, in 21 shares. Object: To carry on business as chemists, druggists, drug merchants, and store-keepers. The registered office is 50, Loncin Street, Docks, Cardiff.

* * * * *

WENGER'S, LIMITED.—Registered on May 24 by Paddock and Sons, Hanley, Staffordshire, with a capital of £25,000, divided into 2000 £1 per cent. cumulative preference shares of £1 each, and 3000 ordinary shares of similar value. Objects: To acquire as a going concern the business, carried on by Albert F. Wenger at Parker Street, Hanley, Staffordshire, of a colour and chemical manufacturer and potter's merchant: to adopt and carry on effect an agreement for the purposes of such acquisition, and to carry on business as manufacturers of and dealers in chemicals, potters' colours and materials, potters' machinery, utensils and appliances, earthenware, china, glass, majolica, stoneware, etc.

* * * * *

INGRAM AND ROYLE, LIMITED.—Registered on May 8 by T. Allingham, 23, Bucklersbury, E.C. Capital £25,000 in 210 shares. Objects: To carry on business as agents for the sale of natural and artificial treated mineral waters, as hitherto carried on by Ingram and Royle at London and Liverpool, and, with a view to the above object, to carry into effect a certain agreement.

Diary of the Week.

[Notices for insertion under this heading should reach the Editor on or before Wednesday.]

FRIDAY, JUNE 7.

Royal Botanic Society.

"Romance of Plant-Life," by Dr. D. Morris.

SATURDAY, JUNE 8.

School of Pharmacy Students' Association.

Botanical Excursion to Epping Forest, leaving Liverpool Street at 2.34 (Bloomsbury Square, 1½ for Chingford.

Pharmaceutical Cricket Club v. Hainley Cricket Club (High Barnet). Leave King's Cross (Suburban) at 2 p.m.

MONDAY, JUNE 10.

Royal Institution of Great Britain, at 5 p.m.

General Monthly Meeting.

TUESDAY, JUNE 11.

Royal Colonial Institute, at 8 p.m.

Ordinary Meeting.

Royal Photographic Society.

Ordinary Meeting to be held at the new premises, No. 12, Hanover Square.

THURSDAY, JUNE 13.

School of Pharmacy Students' Association, at 7 p.m.

"Report on Physics," by Mr. H. T. Durant.

FRIDAY, JUNE 14.

Royal Astronomical Society, at 8 p.m.

Ordinary Meeting.

SATURDAY, JUNE 15.

Geologists' Association (London).

Excursion to Tillingstowrell. Leave Cannon Street (S.E.R.) at 2.17 p.m. for Godstone.

Late Advertisement.

WANTED, a good Junior Assistant (in-door). Apply ROBERT DONINGTON, Market Place, Spalding.
Trade Notes.

Messes. Southall, Brothers and Barclay have introduced an improvement on their well-known "sanitary towels," which consists in forming the pads of alternate layers of absorbent cotton-wool and gauze. The effect of this combination is to prevent contraction of the area of the discharge, and the improved towel is said to be more absorbent, more comfortable, and more cleanly than the ordinary pads. It is supplied at the low price of one penny.

Messes. E. Ring and Son, Pharmaceutical Chemists, St. George's Street, Canterbury, have fitted up a photographic dark-room and stock dry-plates, etc.

Mr. G. R. Lawrence, Pharmaceutical Chemist, High Street, Rhyl, also stocks photographic necessities, and allows customers the use of a dark-room free of cost.

Mr. J. W. Littlefield, Pharmaceutical Chemist, High Street, Ventnor, Isle of Wight, supplies similar accommodation for wandering photographers.

Messes. Wm. Wyatt and Co., Pharmaceutical Chemists, Stonewell, Lancaster, have also joined the ranks of those who serve the worshippers of the sun, and help them to exclude his electric rays on occasion.

Personal Notes.

Dr. Tirard, the recently appointed Secretary to the Pharmacopoeia Committee of the General Medical Council, is Professor of Materia Medica and Therapeutics at King's College, and the author of the "Prescriber's Pharmacopeia."*

Mr. J. H. Maiden, who has been assisted by Mr. W. S. Campbell, has completed Part I. of "The Flowering Plants and Ferns of New South Wales." The work is issued under the authority of the Department of Mines and Agriculture for New South Wales.

Prof. J. S. Burdon-Sanderson has been elected an honorary fellow of Magdalen College, Oxford, where he formerly held a fellowship annexed to the Waynflete chair of physiology.

Mr. Alexander Ellis, late of Skelton-in-Cleveland, will shortly commence business in Victoria Terrace, Westoe Road, South Shields, where he is having premises fitted by Messrs. Evans, Son, and Co., and the York Glass Company.

Mr. A. Bailey, who has been for the past eight years with Messrs. Burroughs, Wellcome and Co., is now joining the firm of Oppenheimer, Son and Co., Limited, as a managing director.

Mr. John H. Smith, Pharmaceutical Chemist, of Newark-on-Trent, is honorary secretary to the local half-holiday association, and seems to have given general satisfaction by the arrangements he made in connection with the members' annual picnic on Thursday, June 6, when Belvoir Castle was visited.

Mr. J. W. Knapman, the worthy Librarian of the Pharmaceutical Society, is to be congratulated on the success of his son—Herbert Knapman, of the Grocers' Company's School, Hackney Downs—who has won a Local Examination Scholarship at Rugby.

Mr. Thomas John I'Anson Bromwich, the Senior Wrangler, is an old Wolverhampton Grammar School boy. His father is in business as a chemist at Durban, South Africa.

Mr. Alexander Gunn, chemist and druggist, will carry on the business of his father, the late William Gunn, of Dunse.

Late News.

Edinburgh Chemists' Annual Excursion.—The annual excursion of the Edinburgh District Chemists' Trade Association took place on Wednesday, 12th inst. The place selected for the day's outing was Kinross, celebrated for its historical associations as well as the beauty of its scenery. The company, which numbered about 100 ladies and gentlemen, left the Waverley Station in saloon carriages at a quarter past ten o'clock. At that time the weather looked slightly ominous, for although there was plenty of sunshine, watery-looking clouds gathered now and again and threatened rain. The journey to Perth through Glen Farg was accomplished in an hour and a quarter, and here the company was augmented by representatives of the trade from Perth, Dunde, Kirkcaldy and Dunfermline, and it may also be mentioned that Mr. Harland, of Messrs. Maw, Son and Thomson, London, was one of the excursionists. At Perth Station the party were in readiness to convoy the company by Bridge of Earn, and through Glen Farg to Kinross. The romantic character of the scenery along this route is well known, and it looked its best on Wednesday in its fresh green, luxuriant foliage. About half-way through the glen a halt was made, and the excursionists partook of refreshments in a wood near the roadside. At this time a sharp shower of rain fell, but it passed over quickly and inconvenienced no one. Kinross was reached about two o'clock, which was greatly enjoyed, having occupied about three hours. Dinner was served in the Green Hotel immediately after their arrival, after which a number of toasts were proposed. The toast "Mr. E. B. Ross, President of the Association, occupied the chair, and on his right and left were Provost Beveridge (Kinross) and Mr. Chas. Kerr (Dundee), Vice-Chairman of the Scotch Executive of the Pharmaceutical Society. Mr. John Bowman was Vice-Chairman. After the loyal toasts had been duly honoured, Mr. Bowman proposed "The Navy, Army and Reserve Forces," to which Mr. Lawlor (Milnathort) replied. Mr. Kerr gave "Success to the Annual Picnic," and the Chairman acknowledged. The Chairman submitted the toast "The Burgh of Kinross," coupled with the name of Provost Beveridge, who replied, and Mr. J. B. Hill gave "The Visitors and Ladies," which Mr. Thos. Gibson acknowledged. Both before and after tea the company had a little time to look around them, and as the weather was by this time quite settled the opportunity was fully taken advantage of. Those who expected to enjoy a row on Loch Leven and to have the opportunity of landing on the island, on which stands the castle where Queen Mary was imprisoned, met with a disappointment. The day had been fixed for the national angling competition on the river and, as a result, everything in the shape of a boat had been previously engaged. There was plenty of scope for enjoyment round the loch, in the grounds of the hotel, and in Kinross House and grounds, one of the seats of Sir Graham Graham Montgomery, which were open to members of the Association and their friends. Eight o'clock, the hour of departure on the return journey, came all too soon. In little more than an hour after the excursionists were all set down again at Waverley Station, and after many hand-shakings they parted all well satisfied, with the day's outing.
MARKET REPORT.

Chemicals and Drugs.

[The quotations given here are in all cases the lowest net cash prices for bulk quantities, and often the articles quoted are not on sale in the requirements of the pharmacist. It is important that this should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.]

THE CHEMICAL MARKET.

THURSDAY, JUNE 13, 1895.

There have been no movements of especial interest in the chemical market since our last report, and business generally is very quiet. Carbolic acid is easier all round, and both citric acid and cream of tartar are dull of sale at fractional reductions. Full details will be found below of the various articles of interest—

ACID, CARBOLIC.—A dull market, and quotations are lower. The current varieties are as follow—

Crystals: 24" to 25" C, 55d. per lb.; 30" to 40" C, 64d. per lb.; 36" to 40" C (detached Crystals), 74d. per lb.; these prices are for bulk quantities in 3 cwt. drums. Crude: 50 per cent., 1s. 6d. 6d. per cwt. 1s. 9d. per cwt. Liquid: 1s. 0d. per gallon for 95 per cent. Cresylic: 114d. per gallon.

ACID, CITRIC.—Dull of sale. Makers maintain their prices at 1s. 13d. to 1s. 2d., and in second hand it can only be bought at 1s. 14d. to 1s. 14d. 6d.

ACID, OXALIC.—Manufacturers’ prices are unaltered, and it is in steady demand at 33d. net., ex works.

ACID, TARTRIC.—A firm market. British brands of acid especially are very steady at a fractional advance, and 111d. to 114d. is now asked; foreign makers still quote both powder and crystal at 11d.

AMMONIA BISULPHITE.—Carbonate, steady at 51d. to 53d.;Queries, unaltered at 3d. to 3s. 3d.; Sal ammoniac. First quality is still returned at 38s., with seconds 27s. Sulphate: A weak market, after fluctuating during the week between £2 18s. and £210, at the close £2 10s. is the quotation for grade 1. 1 Cent.

ASBESTOS.—Unordered. American are worth 40s. and sold 35s.

ARSENIC.—Remains very steady and in poor supply. The price for best white powdered is unchanged from 15s. 3d. to 1s. 10d. per lb. or 15s. to 1s. 10d. per 60 lbs.

BLEACHING POWDER.—Steady. The spot price is £2 to £2 15s., whilst in Liverpool it is quoted at £2 10s. to £2 13s., f.o.b.

BORAX.—There is no improvement in the price, and in second hand powder and crystals are offered at 19s. 6d. and 18s. 6d., respectively. The Syndicate prices are maintained at 21s. and 30s.

COAL-DISTILLATION PRODUCTS.—Benzoic: 50 cent. per lb. is steadier, being now worth 113d. per gallon, but 30 cent. is unchanged at 1s. per gallon. Pitch is a trifle firmer, being quoted at 37s. per ton, f.o.b., whilst Tar is lower, the price per barrel of 40 gallons being now 10s. 6d. Copper Sulphate.—A firm market at last week’s steady rates. It is still quoted at £1 to £1 15s., according to brand.

CREAM OF TARTRAR.—Dull of sale, and again lower prices have been paid. Best white French crystals are now worth 8s., whilst German makers of powder realise 70s. to 71s.

MERCURIALS.—The quotations are unaltered from those of last week. The current prices are: Calomel, 2s. 11d. 3c.; corrosive sublimate, 8s. 3d.; white nitrate, 3s. 2d.; blue pill, 1s. 6d.; ditto, ointment, 1s. 8d.

FISH SALT.—Bichromate: Unchanged at 43s. to 44s. Fisch Salt: Very steady. On the spot it is worth 5d., whilst in Liverpool it has been selling freely at 5d. to 5½d. Permanaganate: Firmer. Small crystals are worth 5½d. 6d. to 6s. Prussiate: Dull of sale at 5½d. to 6½d. In Liverpool also it is dull of sale at 8d.

QUICKLEAF.—Steady. Importers’ prices are maintained at £2 10s., whilst in second hands it can be bought for £2 5s. 6d. to £2 7s. 6d.

SAFFLOWER.—Steady. British refined is still worth 22s. 6d. to 23s. 6d. on the spot, and in Liverpool it is quoted at 23s. 6d. in kegs, and 23s. in barrels.

BODA BROUWERS.—Bitter almonds: £3 6s. in London, £2 15s. in Liverpool. Caustic 70 per cent. 23s., with 50 per cent. 21s. less. Crystals: 85s. Hypophosphite: 15s., and held from £2 15s. to £5 per ton in Liverpool.

THE DRUG MARKET.

THURSDAY, JUNE 13, 1895.

At the drug sales to-day beeswax was in large supply and met with a very brisk demand. James hoesy are sold fairly at steady rates. Thunberg’s worm salt was dear. Cardamoms were steady, but seed was a trifle easier. Eo ipecacuanha met with a fair demand at fully to somewhat firmer rates. Full details will be found below:

ACACIA.—A moderate supply only was offered to-day, and this was all bought in. Fine medium pale, pale gum being held at £1 11s.; small pale gum at £2 6s. to £2 10s. medium yellowish sorts at 30s., and ordinary small sorts at 35s.

ALOE.—Three cases. Thirteen cases only were offered to-day. Of these one case of fair hard seconds sold at 3s. The rest was bought in. Sootyfina: Sixty-one kegs were offered; these were all bought in at the rates of 6s. to 8s. 6d. for grade 2. A few lots of ordinary quality were sold at 19s. 6d. a burlap and a parcel of sixty gourds were all bought in at 30s. for fair, part cafe and dry soupy. East Indian (in tons): Ten cases of medium softish, fair aromas, sold at 33s., the remainder was bought in.

AMBERGOSC.—Five packages were offered. Of these 1 ton of greyish lump sold at 41s., another of yellow lump of fair aroma at 65s., and a ton of inferior quality at 16s.

AMMONIACUM.—Seven packages only were offered to-day. These were bought in from 30s. to 55s. for part blocky seedy gum.

AMMONIA.—Two cases from Hamburg were offered; no bid being forthcoming were bought in at 2s. 6d.

ANISODORA.—Seven cases were offered to-day. These were bought in from 30s. to 55s. for part blocky seedy gum. In

ANISEED.—No inquiries. Good bright red Madras seed was sold at 5d.

ANISIT.—Ten cases from Hamburg were offered; no bid being forthcoming were bought in at 2s. 6d.

APIS.—Three cases were offered to-day. These were all bought in at the rates of £16 10s. for both pale and dark loose almonds, and £20 10s. for mixed blocky and amonady seconds. Of the 200cwt. medium almond, 25cwt. medium seconds, 25cwt. loose almonds, 10cwt. of 16s. 6d. and 10cwt. of 18s. were sold at £2 per cwt., and £2 15s. and medium ditto, with false packed sides, £2 5s. and dull small almonds, false packed, at £2 6s. 7d.

BUCHU LONG.—Of 40 packages offered to-day, good round green leaves sold freely at 7½d. to 8½d. per cwt. ordinary ditto, 15½d. to 21d. Long leaves were bought at 6d.

CAFFRE.—The position remains unaltered. Small sales have been made in second hands at 25s. per lb., while for August delivery it can be bought at 12s. to 16s.

CALDUMA BARK.—Fair to good yellow root of bright colour was bought in at 21s. to 30s., according to quality.

CAMPHOR (GRUDe).—Remains in good demand at steady rates. For arrival, May to July shipment, both China and Japonis have been selling at 165s. On the spot 17s. has been the price during the week, but little business has been done, owing to the high prices asked. To-day a large amount was offered. This was all bought in, Japonis at 165s., and China at 160s.

CAMPHOR (REFINED).—The quotations of the British and foreign refiners are unaltered as yet, the current quotation for 10 cwt. lots being 85d. for 500cwt. of flowers, with squares at 2s. 10½d., and proportionate rates. To-day German refined was bought in at the sale at 8s. 4d., a bid of 1s. 6d. being refused.

CANADA BALSAM.—Three cases of clear balsam were bought in at 1s. 6d., the limiting being 1s. 4d.
CANNABIS INDICA.—None was sold to-day. Streaky brownish, seedy tops, were bought in at 3d. to 4d. A case of clean tops in bundles packed in tins were bought in at 3d. to 4d.

CARDAMOMS.—In good supply and selling at steady rates. The prices realised were as follows:—Ceylon Mysore, medium to bold pale, 2s. 3d. to 2s. 7d.; small to medium pale, 1s. 5d. to 2s.; small to medium yellow, 1s. 5d. to 1s. 8d. to 1s. 10d., condition unchanged. Seed was hardly so firm, and sold at 1s. 9d. to 1s. 10d.

CASCARILLA.—A parcel of 90 bales of small silvery bark sold freely at 2s. 6d. to 4s. according to quality. Stiff, broken in market at 2s. 6d.

CASSIA FISTULA.—Forty-one bags of bold pod were bought in at 2s. 5s., the limit being 20s.

CINCHONA.—Crown bark was bought in at 9d. ; Yellow bark sold freely at 1s. to 1s. 3d. for good qualities, down to 6d. for second class damaged, and 2d. for third ditto. Cargahena bark was bought in at 1s.

CLOVER.—The market for delivery is very active, and a large amount of business has been done in Zanzibar at steady rates, the prices being 3s. 2d. to 3s. 4d. for June to August, and July to September delivery. At the sales on the 13th inst. Zanzibar was all bought out. Penang was dull of sale, a few cases only of fair picked, selling at 6d. to 8d. at 4½d. for dark qualities.

COCOA.—So much broken Trussillo of good leaf colour were bought in at 11d. to 14s., according to quality and coquina.

The reduction in the Convention price noted last week was quickly followed by another drop of 9d. per os., in order to "knock out" the outside makers, and the current quotations for Hydrochlorate are now as follows:—For 100 os., 1s. 6d.; from 50 to 100 os., 1s.; and for lots under 50 os., 1s. 4d. These broken Trussillo of leaf sold in lots at 11d. to 14d. per os. Citronella:—Very firm, the spot price for oil in tins being 1s. 4d. Lemon:—One case sold at 4s. 8d. Lemon Grass:—Dull of sale at 14d. Lime:—Dull. One case sold at 1s. 6d. per lb. Nutmeg:—Bought in at 1s. 6d. per lb. Otto of Limes:—Sold to-day at 4s. 6d. per lb. Peppermint:—Demenhoulised was bought in at 6s. 6d. 40 per cent. at 8s. 6d., and Cockie's oil at 5s. 9d. Patchouli:—Bought in at 1s. 11d. Spearmint; H. G. Hochitska's oil was bought in at 11d.

COTTON (fixed and spirits).—Castor:—Very firm at a fraction advance. Italian oil is quoted at 5s. 11½d.; Cotton nut:—Steady. Ceylon is quoted at 23s. 11½d. in 12s. and 24s. 15½d., and Mauritius at 23s nominally, on the spot. Cotton:—Firm. Refined oil is worth 21s. 10½d. according to make and package. Linnen:—Very firm at an advance. In barrels on the spot it is quoted at 23s. 10½d. Rope:—Firm. Refined oil is worth 22s. 10½d. to 23s. on the spot. Turpentine:—Lower. On the spot American spirit is now worth 23s. 4½d. to 23s. 6d. Petroleum spirit: American is quoted at 5s. 9d. to 6d. 6½d. White, 6½d. to 7d. Russian, 5½d. to 5½d. Petroleum spirit, ordinary, 8½d. to 9d. Deodorised, 8½d. to 9d.

COX'S ROOT.—Florentine root is quoted at 78s. per cwt. for good sorts, for best export.

CUMIN.—Remains quiet but steady. There have been no sales of importance, business being confined to a few small lots of B. & S. and H. B., on the spot at 1s. 9d. To-day 600 cwt. of Howard's quinine were bought in at 1s. 8d., the limit being 1s. 9d.

DILL SEED.—Five bags fair seed sold at 11s. 6d.

DEODORATOR.—None was sold to-day. Fair lump seed; qualities, 11s. 6d. to 11s. 9d.; seconds ditto, 11s. 3d. to 11s. 6d.; best druggists', 9s. to 9s. 6d.; seconds ditto, 8s. to 9s. ; Persian: The market is cleared out of first-hand parcels, and fine qualities are worth 12s. 6d. to 13s. 6d. Rough stocks at some dealers. Rates of English crop are favourable, and unless prices advance in China, the market will probably be quiet until the advent of the new crop.

DILL—Tinisically leaves are in fair demand at fully steady rates. Good green medium to bold sold at 4s. 6d. to 5s. 6d. for medium yellowish, and 1½d. to 1½d. for ordinary dark. Pods were bought in at 2d. Alexandria leaves were all bought in at rates ranging from 6d. to 1½d.

DILL.—In large supply to-day and met with a brisk sale at fully steady rates. Madagascar sold at 26s. 17½d. to 27s. 2½d.; Jamaica 27s. 15½d. to 28s. 10½d.; Australia 27s. 5½d. to 27s. 10½d.
Exchange.

[Notices of books, apparatus, etc., for exchange, of reasonable length are inserted free in this column, if they do not partake of the nature of ordinary advertisements. The notices should be written on post-cards, addressed "Editorial Department, 17, Bloomsbury Square, W.C."

WANTED.

'PHARMACEUTICAL JOURNAL,' February 23, 1886.—Full price will be paid by the Secretary, 17, Bloomsbury Square, London, W.C.

INDIA-BINDER URINAL (male) for day and night use.

—Judge, Chemist, Bourse, Linos.

OFFERED.

LANCASTER'S MULTIF-IN-PORTO ENLARGING CAMERA, 12 by 10, condition as new, and small sum; in exchange for 4-plate instantanograph, complete.—Walker, Grange Mount, Birkenhead.

LACRAME'S SPECTACLES, stock of; new; all sizes. What price?—W. G. McNab, Chemist, Gorbodwick, Midlothian.

LABORATORY FITTINGS, including over 100 bottles containing all ordinary metallic salts, and about five dozen monometallic salts for sale at any reasonable offer. Full details from Simpson, Stonebridge Park, Willesden.

FRITCHARD'S HORSE AND CATTLE PANACEA OR EMBRICATION.—5 2s. 6d.; 6s. 6d.; 10s. 6d.; 17s. 6d.; Fritchard's Household Panacea or Embrocation, 7s.; 5 2s. 6d. Holloway's Ointment, 1s. 6d. each; 1 Godfrey's Extract, 1s. 6d.—Cocker, Chemist, Laton, Beds.

BELL-SHAPED MILITARY TENT, 40 feet circumference complete, with pole mallet, etc. Cost £25, in perfect condition. Price £15. cash, with order.—W. H. Aukland, Chemist, 46, Camden Road, London, N.W.

STEAM JACKETED PAN, holds 110 gallons. Jacket and pan all copper tinned inside, on strong wrought-iron stand, and as new, £25.—Moss, Chemist, Ilkeston.

BOOKS.—Roseo's 'Chemistry,' 1892 edition, quite new, 3s.; Woodland's 'Materia Medica,' 1s. Offers.—Symonds, 280, Fulham Road, S.W.

Cricket News.

PUTTLE'S versus COOPER'S.—This return match was played at the Paddington Recreation Ground on Saturday, June 8, and resulted in a victory for the former, the scores being S.L. School of Pharmacy 130, and Central School of Pharmacy 86. Mr. Harris scored 41 not out, and Mr. Plamstead 86 for the victors.

New Books and New Editions.

[Publishers are invited to forward full particulars of new publications, including price.]

INDEXES TO THE WORKS OF CERIUM AND LANTHANEUM. By W. H. Magee. (Smithsonian Miscellaneous Collections. No. 971.) Svo, pp. 43. Price 2s. 6d. (William Wesley and Son, London.)

ACROSS THE COMMON. By M. C. Cooke. Cr. Svo, pp. 98. Price 1s. 6d. Boards, 1s. (Nelson, London.)

A STROLL ON A MARSH IN SEARCH OF WILD FLOWERS. By M. C. Cooke. Cr. Svo, pp. 94. Price 1s. 6d. Boards, 1s. (Nelson, London.)

THE FIRST BOOK OF ELECTRICITY AND MAGNETISM. By W. P. Maycock. 2nd edit., thoroughly revised, corrected, and greatly enlarged, post Svo, pp. 290. Price 2s. 6d. (Whittaker and Co., London.)

Diary of the Week.

SATURDAY, JUNE 15.

Pharmaceutical Cricket Club v. Burgoyne, Beridges and Co. (Willesden). Train leaves Euston at 2.15 p.m.

MONDAY, JUNE 17.

Royal Geographical Society, at 8.30 p.m.

"Amazons," by H. F. B. Lyshch.

WEDNESDAY, JUNE 19.

Western Chemists' Association (London), at 9 p.m.

Adjourned Discussion on the Present Condition of the Phosphorus Law.

University College (London) Chemical and Physical Society, at 5 p.m.

Ordinary Meeting.

Geological Society of London, at 8 p.m.

Evening Meeting.

Edinburgh Chemists', Assistants', and Apprentices' Association, at 8.30 p.m.

Summer Meeting at 36, York Place, Edinburgh.

Society of Arts, at 9 p.m.

Conversations at South Kensington Museum.

Geological Society of London.

"On the Occurrence of Spirorbis-limestone and this Coals in the so-called Permian Rocks of Wye Forest; with Considerations on the Systematic Position of the Permians of Salopian Type," by T. Croebie Cantrill.

THURSDAY, JUNE 20.

Linnean Society of London, at 8 p.m.

"The Eyc-Cases of Port Jackson Sharks," by K. E. Waite.

Chemical Society, at 8 p.m.

Extraordinary General Meeting to consider change in Bye-laws. I. proposed by the Council. Ballot for the Election of Fellow.

"Transformation of Ammonium Cyanate into Urea," by Professor Walker and J. F. Hamly.

"Note on Thio-Derivatives of Sulphamic Acid," by the Walker.

"Etheral Salts of Ethane tetracarboxylic Acid," by Professor Walker and J. R. Appleyard.

FRIDAY, JUNE 21.

Pharmaceutical Society of Great Britain (North British Branch), at 12 noon.

Meeting of Members and Associates in Business. Address by the Chairman. Result of Election of Executive.

SATURDAY, JUNE 22.

Geologists' Association (London).

Excursion to Totterhoe, Leave King's Cross (G.N.R.) at 1.35 p.m. for Dunstable (L.N.W. Station).
In addition to being the sole periodical publishing full and complete reports of the transactions of the Pharmaceutical Society and of the British Pharmaceutical Conference, the JOURNAL records the proceedings of pharmaceutical and other scientific societies throughout the country, and chronicles all important advances in pharmacy and allied subjects in this country and abroad. Reviews of new scientific and technical works form an important feature in the JOURNAL, and its pages are also open for the discussion of matters of importance to British pharmacists generally, as well as for the purpose of supplying special information desired by subscribers.

The JOURNAL is supplied from the Publishing Office, 5, Serle St., Lincoln's Inn, W.C., post free for twelve months to any address throughout the world, on receipt of remittance for Ten Shillings and Sixpence.

Photography for Chemists.

THE LENS.

Of all subjects the lens is about the most misunderstood of any in connection with photography. In the first place most of the text-books are too advanced or too superficial.

There are three types of lenses, the single achromatic or landscape lens, the doublet or rapid rectilinear, and the portrait lens, this last being but rarely used by amateurs at least. The doublet or rapid rectilinear is the most useful all-round lens, and should always be recommended in preference to the single lens. There are two species of the rectilinear, and considerable confusion exists not only in the minds of users but of sellers also sometimes, and this has been fostered by the makers giving all sorts of absurd names to practically the same lens. A doublet when of short focus relatively to the diagonal of the plate on which it is to be used is called a wide angle, or portable symmetrical lens, and it is a common idea that a wide angle lens always includes a wide angle, but it does so only when it is used on a fairly large plate, and it is an indisputable axiom that lenses of the same focus always include the same angle on the same sized plate, no matter what they are called.

The distance from the lens to the ground glass when a distant object is focused is always called the equivalent focus or the focal length of the lens, and as this is an important factor to determine we should know how to do it. Screw the lens on to the camera front and against the wall pin a foot rule or inch tape, now arrange the camera so that the image formed by the lens fills a definite space. For instance, supposing we take 12 inches of the inch tape, their image should occupy just 4 inches; by a little shifting of the camera and repositioning the lens in and out this will be easily done. Now without disturbing the camera at all, measure the distance between the ground glass and the foot rule, and multiply this distance by the amount of reduction; in the case in point this is 3. Then divide the result by the number expressing the times of reduction plus one squared. For example, with a given lens we find the distance between foot rule and ground glass to be 12 inches, then $36 \div (3+1)^2 = 2\frac{1}{2}$, which is the equivalent focus of the lens.

It is very frequent to find that dealers or manufacturers call their lenses "rapid" or "extra rapid," and by this term they mean that the lens transmits more light than others, but the amount of light transmitted is solely dependent upon the size of the lens in relation to its focus, or, as it is technically called, the ratio aperture of the lens, and this is determined by the diameter of the lens or diaphragm, or, as this last is sometimes called, the stop; and the ratio aperture, or, as it is generally written, $\frac{F}{X}$, value, is determined by dividing the equivalent focus by the diameter of the lens. If we have a lens which, by the above method, is found to have a focus of 8 inches, and the largest stop has a diameter of aperture of 1 inch, we get $8 \div 2 = F/8$, and if the second size stop has a $\frac{1}{2}$-inch diameter, it will obviously be $F/10$, a $\frac{1}{4}$-inch stop will, of course, be $F/16$, a $\frac{1}{8}$-inch $F/32$, and so on.

The following rule is absolute and cannot be explained away by any specious advertisement, so that, as many amateurs know it, it is just as well to be careful when speaking of lenses, to bear in mind that all lenses working at the same ratio aperture are of absolutely the same rapidity, whether single, doublets, or portrait lenses. This does not seem such an easy matter to understand, because if you take a 4-inch lens, the $F/8$ stop is much smaller than the same ratio aperture of a 18-inch lens, as a matter of fact it will be just one-fourth the size. The explanation is as follows, and as dealers are frequently called upon to explain these points, it may be useful:—Only a given amount of light can pass through a given sized hole, and as all the light that reaches the plate has to pass through the stop, we may for the time being consider it as the source of light. It is an accepted axiom and easy to be demonstrated, that the intensity of the light decreases as the square of the distance.

Now, as the amount of light passing through two holes is equal to the area of the holes, or, what is the same thing, to their diameter, it is obvious that if we have a certain amount of light passing through
are absolutely antagonistic. Depth of focus may be defined as the power to define upon a flat surface objects situated at varying distances from the camera. Now, theoretically, only one plane can be sharply defined at one instant, but hazy the projection in size of objects and the inability of the eye to distinguish between very minute distances a lens seems to be able to depict several planes sharply, and this power increases inversely to the reduction of ratio aperture and focus, or, to put it in plain language, the shorter the focus of the lens and the more it is stopped down the greater the depth of focus it possesses, and vice versa.

Of course amateurs like to see specimens of work produced by a lens which they are recommended to buy, and to make such specimens a little cuteness, whilst perfectly legitimate, may go far towards deciding the question of purchase. In making such specimens never choose a flat object like a row of houses, a sheet of printed type, or the wall of a room, but choose a simple landscape subject where the objects at the side of the focusing screen are somewhat nearer to the camera than the centre, and do not focus such objects at the centre but place midway between the centre and the margin. A far better result as regards definition will be thus obtained with any given aperture.

The question as to the particular focus for any given sized plate is merely a matter of choice, but for a quarter plate, 3½ to 4 inches for normal work, and from 2½ to 3 inches for wide angle work, for half plate from 4½ to 5 inches is usual, and 4 to 5 inches for wide angle; for whole plate, 11 to 13 inches, and 5 to 7½ for wide angle work. It is important to remember that all lenses of the same focus give absolutely identical sized images from the same standpoint.

We have in England several well-known opticians who advertise in photographic journals, and from whom their lenses can be obtained wholesale when asked for, but a chemist may frequently wish to sell cheaper lenses, and these are usually French lenses, and can be obtained from Clement and Gilmer, Eade de Malte, Paris, or Levi and Co., at prices ranging from a few shillings to as many pounds. To give some idea of how cheap landscape lenses can be obtained, I may state that the glasses themselves, unmounted in cells or tubes, can be obtained from about 1s. a piece for half-plates.

Choice of Photographic Apparatus.

BY FOTO-FILE.

To the chemist who is desirous of taking up photography, and to the customer also, size of apparatus is an important consideration. The principal sizes are:

![Image](image-url)

For instance, we have a double lens, the front glass of which is 2 inches in diameter and the distance between the two lenses is 2 inches, the diaphragm will probably be just 1 inch behind the front lens. Supposing this lens to have a focus of 16 inches, a diaphragm may be marked F/16, and from what has been previously said, it might be supposed that the diaphragm would be equivalent to both, but whereas to get the true ratio value it would be probably 7/8ths of an inch, this and also applies to the larger and smaller sizes. Now if an ardent amateur buys a lens so marked and sets about determining the ratio value of his stops, and finds them marked, as he thinks, wrongly, he will probably set the lens with a rod as the dealer asking for an explanation, and if this is not forthcoming, a customer may be lost, so that this should always be looked out for. If such a case does arise and the dealer can satisfy his customer that the lens is right, but that the purchaser is wrong, the probabilities are that a far greater respect will be entertained by the said customer.

To test the true ratio aperture of any stop, an easy method is to take a piece of black cardboard large enough to entirely fill the back of the camera when the focusing screen is removed; in the centre should be punched a good-sized pinhole. The lens should be screwed on to the camera and the latter racked out to the equivalent focus of the lens, and the whole taken into a darkened room. The card should now be inserted in place of the focusing screen, and a lamp or lighted candle be placed outside the pinhole in the card, and on examining the lens, the front of it will be distinctly marked by a circle of light which can sometimes be more readily seen by just dusting the lens with a little French chalk. The diameter of this circle is the true effective or working aperture of the diaphragm.

The first thing an amateur does when he buys a new lens is to screw it on to his camera front, set up his camera and examine the ground glass, and possibly take a negative, generally with the full aperture, the result being that he finds that, supposing he has photographed a wall of his room or a row of houses opposite his window, only the centre is sharp, the sides being quite fuzzy or indistinct. Generally a complaint will be made about this, but there are lenses made except some of the most recent German lenses which will cover the plate for which they are advertised perfectly sharp with full aperture; it being generally necessary to stop the lens down or insert the diaphragms till about F/8 is used before really satisfactory results are obtained. Nothing can be done in such cases except to reason quietly, and point out that it is an inherent fault, which can only be got over by one of the new German lenses, such as Zeiss, Goerz, or Voightlander, which cost from twice to two-and-a-half times the price of the English lenses.

Depth of focus is another bugbear—every amateur wants a lens which works at a very big aperture, and yet possesses great depth of focus, and the two things...
size, the only thing in its favour being that you can sometimes from a 5 by 4 negative obtain a lantern slide by contact printing, whereas from the quarter plate you sometimes have to sacrifice a little. About the stereoscopic sizes I shall have something to say presently. The half plate is a very popular size, possibly owing with the humble quarter plate in general use. The 7 by 5 is by no means the artistic, that is, the ratio of the two dimensions are the most artistic, but this is somewhat absurd, because any print can be cut to the same proportion, 1:1.5, no matter what plate it was taken on. The plate is my favorite size, so I have plenty of room on the plate, it will give prints that allow plenty of margin for lopping down, and when used entirely it presents a reasonable sized picture; above all, we may leave it to the millionaire who can afford a "gillie" to carry his apparatus, and who has a long purse to stand the expense, for it must not be lost sight of that the larger sizes expense increases not only in the apparatus but also in every plate and piece of paper used.

I have no less than six cameras, two quarter plates, a half plate, a whole plate, a 15 by 12, and a 24 by 18. I need hardly say that the two latter have been responsible for more than its share of my money. For as I get older I get lazier or else less capable of dragging about such heavy weights. The question of weight is an important one. For ladies practically a half plate (usually written 3½ pl.) is the largest size they can stand, generally a quarter plate (3 pl.) will by them be found enough. To the tourist who makes use of his own legs and not a cycle, a quarter plate is big enough for a day's tramp; for, speaking from personal experience, even the humble quarter plate becomes at the end of a day's tramp of sixteen or twenty miles a most uncomfortable and weighty. But as I sometimes carry a whole plate (1½ pl.) on a tramp of twelve miles I ought not to grumble. A friend of mine, who frequently does a little walking with me and is satisfied with a very lightweight quarter plate, says sometimes when he sees my whole plate kit ready to be shouldered, "Well, you must be a fool or a great enthusiast even now to cart that waggon-load of stuff about a bit of earth, though I really believe the quarter plate does duty often and often, particularly as the weather gets hotter.

The only disadvantage with the quarter plate is that as one gets on so as to be able to turn out a decent negative and decent print, there will be an intense, and I might almost say an insane, desire to get a bigger camera so as to be able to turn out bigger work, and at the same time, it is hoped, better work, for somehow every two years seems to think that with bigger plates better work can be done; this is, of course, an absurdity, but still there is always the same feeling, and it frequently leads to the first camera being sold at a sacrifice, and a larger one being bought. If a half plate or whole plate camera is bought in the first place, what are called carriers can now be used, these are small wooden frames which fit into the dark slides, and enable one to use smaller plates than those for which the camera is built. By means of these carriers it is thus possible to use half or quarter plates in a whole plate, or 5 by 4, or quarter plates in a half plate.

Naturally in selling apparatus the larger the size the larger the profit, so this will have some weight with the chemist with a dealer.

The question as to the type of camera, whether square bellows, tapering, or conical also sometimes called Kleinase from their inventor, cannot be decided off-hand. The conical bellows allow of considerable reduction in weight and size of the camera, but they may sometimes prove a disadvantage in using short focus lenses or the rising front of the camera.

There are three main types of lenses, the single achromatic or landscape, the rectilinear or doublet, and the portrait lens, the last we may dismiss at once as unnecessary, but of the other two I would certainly recommend the former. The rectilinear is a very good lens.

We now come to the camera case. For touring there is nothing to equal the knapsack carried on the back. It is thus far easier to carry the apparatus a long time without excessive fatigue than any other way. In having such a case made the main point to be observed is to have the shoulder straps broad and of soft leather; they should be at least 24 inches wide, and padded slightly to prevent them from cutting the shoulders. The knapsack may be made to take only the camera and lenses, and a special hand-case may be used for the dark slides of large size, or if small they may be included with the camera.

The stand, although generally considered as a minor part of the outfit, is important because even although a good camera and lens may be obtained it will be practically rendered useless if a weak rickety stand is obtained which vibrates with every wind. The head of the stand should be large and the spread of the legs where the head stands stands as great as possible. As this gives firmness and rigidity, for the nearer they are to one another the more the support approaches that of a point, and a heavy weight on the end of a rod or stand, attached to it by a point, is the least stable of all methods of support.

FORMULÆ AND PRACTICAL DIRECTIONS.

[The formulæ and directions for working here given are specially compiled for pharmacists by a practical chemist and photographer, who will be pleased to supply any special information required, or to answer photographic queries. Letters should be addressed "Editorial Department, 17, Bloomsbury Square, W.C.", with the word "Photography" in upper left-hand corner of envelope.]

PLATINUM TONING BATHS.

For Chloride Papers.

Platinum toning is now all the rage for both gelatino and collodion chloride papers, particularly those with matt surface, and either a liquid or a dry bath may be put up for sale.

Liquid Bath.

Potassium chloroplatinate.......................... 30 grs.
Lactic acid (ep. g., 1:21).......................... 155 m.
Distilled water........................................ 10 oz.

Directions for use—Dilute this solution with double its volume of water before use.

Dry Powder.

Potassium chloroplatinate.......................... 15 grs.
Sodium lactate........................................ 150 grs.
Acid sulphate or phosphate of soda............ 150 grs.

Directions for use—Dissolve the powder in 36 ozs. of water.

For platinum toning there are three or four conditions which must be fulfilled, and these should be included in the shape of a circular with these baths. After printing the print should be placed in a solution of salt, 2 ozs., water, 20 ozs., for at least ten minutes and kept on the move. They should then be washed for five minutes and toned, and when toning is complete transferred to a solution of washing solution, 1:30, and there after about five minutes to a fixing bath composed of—

Hypo.................................................. 2 ozs.
Sodium sulphite...................................... 1 oz.
Sodium carbonate................................. 0.5 oz.
Water................................................... 1 oz.

and then thoroughly washed. The above toning baths will keep any length of time, do not eat out the details of the high lights, and will tone several prints in succession, giving sepia brown to brownish black tones, according to
the depth of printing and length of stay in the toning bath. The only difficulty about platinum toning is that it is extremely difficult to tell what the final tone will be, as the printed-out image is either yellowish or reddish-purple when the intended platinum black, so that, depending on the water and the yellowish image added to the finely divided platinum black.

**Back for Plates.**

At the present time there is considerable demand for plate backings, which can be easily applied and readily removed. There are two distinct kinds, one a solution or paste which is applied to the back of the plate, and the other a sheet of paper or cloth coated with some stickiness substance which can be laid directly on the back of the plate, and then removed after development, and can be used over again.

The first kind includes collodions, varnishes, and caramels.

**Collodion for Backing Plates.**

| Pyroxylin | 5 gms. |
| Methyleated spirit | 1 oz. |
| Collodion rouge or aurine | 10 gms. |

Allow to stand for three days, shaking occasionally, then decant from any undissolved precipitate and bottle.

**Varnish for backing plates.**

| Gum mandauro | 13 ozs. |
| Cellulose | 8 ozs. |
| Methylated spirit | 4 ozs. |
| Dragon's blood | 150 gms. |
| or Aurine | 75 gms. |

Macerate for a week and apply to the back of the plate with a pad.

These need not be removed prior to development.

**Caramel Backing.**

Caramel is of course nothing more than the liq. aq. ext. of the wholesale house, but it varies so much that a few words may be out of place. A good quality of caramel which is applied to a piece of glass should dry within twelve hours perfectly hard, if it does not then it has been improperly prepared. But all samples will be improved by the following treatment. Pour, with constant stirring, 5 ozs. of caramel into half a pint of methylated spirit, stir thoroughly about ten minutes, allow to settle for half an hour, then syphon off the supernatant liquid as closely as possible, collect the residue on a piece of fine lint and drain, dry it thoroughly and weigh it and mix with an equal weight of burnt sienna in wetter paste as sold by the ordinary oil and colourman, and rub in half its weight of powdered gum arabic. This should be put up in small 2 ozs. tins with tight fitting lids, and labelled—

**Caramel and Sienna Backing—A Preventive of Halation.**

Directions for Use.—Apply to the back of the plate with a small pad, a roller squeegee or stiff brush, and rear the plate up in a light tight box to dry. This can be readily removed before development by a wet rag. The second class of backings are made with some sticky, slightly hygroscopic mass, applied to cloth; a good cloth to use is black silk, and a piece of the desired size should be fastened by drawing pins to a flat board or table. The sticky composition may be made of course like a soft emulsion adhesive, using powdered bitumen as the colouring matter, but a preferable compound almost, one suggested by David. Soak 75 gms. of Nelson's gelatin in half an ounce of water, add 1 oz. of glycerine and half an ounce of dextrin, and dissolve in a little water, and finally half an ounce of liq. sacchar. usit. Whilst still hot, pour on to the gelatin and stir it well, add not hot, plaster of iron, and giving it a fairly thick coating; allow to dry and then cut up and pack face to face with wax paper in between.

Memory Training.—In an age when competition is keen, anything that will strengthen one's position educationally should meet with encouragement. Professor Loiseau's system of improving the memory has met with much success, and has been eulogised by Dr. Andrew Wilson, Dr. Mercer, and other members of the Faculty.

**Answers to Photographic Queries.**

G. B. Wright says: "In an article on Photography Formulas in 'Journal Supplement' for May 25, there are instructions for making solution of chloride of gold. It says there that the solution is to be made up to 1744 fluid drachms, so that the solution must be sold in each dram. Is this correct? If so, the other statement that it is equal to nearly 16 by 15 gr. tubes must be wrong. I tried to work it out, but cannot find how much silver there is in the sovereign. It is not possible. If 15 gr. tube is 3 cc., the solution sold for 2s., the total amount realised will be 2s. 2d. only, not 3s. 2d.

An Australian sovereign contains 113 grains of pure gold, nearly all 15-grain tubes of commercial chloride of gold are labelled 'guaranteed to contain 113 grains of pure gold,' therefore, it is obvious that 113 grains of pure gold converted into chloride must be equal to 113 + 7 = 114 tubes of chloride. Now it was stated on the 25th ult. that 1744 drachms of solution would be obtained, but this is only equal to 1744 - 113 = 1631 tubes—obviously there is an error somewhere. We have seen that an Australian sovereign contains 113 grains of pure gold, and as 1 grain of pure gold will make 1.943800 grains of AuCl₃, it follows that 113 grains of gold must make 174.246 grains of AuCl₃, and if a tube contains 15 grains of gold chloride, 174.246 grains must fill 111.616, etc., tubes, yet this does not agree with the previous statement. Since then the expression of 113 grains of gold chloride is nearly always the acid chloride or chloro-auric acid, AuCl₃HCl₃H₂O, or the double chloride of gold and sodium, sometimes known as the chloro-aurate of sodium, AuCl₃Na₂Cl₃H₂O, and as 113 grains of gold chloride, 113/174.246 gms. of NaCl₃HCl₃H₂O = 235.56 gms. of sodium chloride, AuCl₃Na₂Cl₃H₃O; it follows that if you actually make the solution up to 1744 drachms and sell this at the rate of 2s. per 15 drachms, you get too much for the money. More. Dilute it more still. Make it up to 2300 drachms, and reap the benefit in solid cash.

Instead of the previously suggested label, it might merely be stated: Fifteen drachms of this solution are equal to one tube of commercial chloride of gold.

Rex has got into a difficulty over a stock solution of hydroquinone, as he is unable to make a 10 per cent. solution. The solubility of hydroquinone in water is only 1 in 20, and therefore a 10 per cent. aqueous solution cannot be kept at normal temperatures. The only way to make and keep well a 10 per cent. solution is to use rectified spirit, but equal parts of absolute alcohol and sulphuric acid are preferable; glycerine may be used as the solvent, but as this causes frothing of the developer it is not to be recommended. The dyer's mixture is by far the most satisfactory, and were evidently drawn up by a printer and not a photographer, as if the solution is used as directed, there will be over 4 grains of hydroquinone to the ounce, which is unnecessarily strong. The following formula, however, will answer:—

**Foreign Photographic Formulas.**

**Aluminium for Flashlight.—**Dementjeff states that 15 gr. of a mixture of aluminium powder; the so-called aluminium bronze, 1 part; potassiumpermanganate, 2½ parts; burns in one-eighth of a second.

**Blue Transparencies.—**Bujakowitch recommends the ferro-prussiate process for making blue transparencies. His blue is precipitated from a solution of ferric chloride by the addition of sodium carbonate, left to settle, the precipitate washed and dried. To prepare the sensitising solution 154 gr. of ferric-hydrate are mixed with 220 gr. of oxalic acid and 83 gr. of hot water. When dissolved, the solution is filtered, and it should be kept in the dark.

*From Eder's 'Jahrbuch,' through the Amateur Photographer.*
Glass coated with plain galatin solution or else old dry plates, may be used; the latter should be thoroughly fixed and washed, and then immersed for three minutes in the sensitizing solution and dried. They require about thirty minutes’ exposure in diffused light under a normal negative, and should then be developed with a 10 per cent. solution, to 15 per cent. solution of potash -a boiling liquid, to 30 per cent. solution, to show the necessary vigour, and should then be soaked in a 3 per cent. solution of hydrochloric acid for about five minutes, and then well washed and dried.

Glycin and Pyro Developer.—Hartshorne warmly recommends a combination of these two developing agents, and suggests the following formula:—

<table>
<thead>
<tr>
<th>No.</th>
<th>Formula</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Water, 7 oz.</td>
</tr>
<tr>
<td>2</td>
<td>Water, 7 oz.</td>
</tr>
</tbody>
</table>

For use, mix equal parts of a, b, and water. This gives soft results, specially suitable for portrait work.

A Simple Photographic Method.—W. H. Huylop gives the following explicit instructions by which he claims that any one familiar with dry plate photography may produce half-tone printing blocks. Take any of the slower brands of gelatin films—that is, those which are more sensitized on celluloid—and expose behind a ruled screen in the usual way, giving of course, a much shorter exposure than given for wet collodion. Develop the plate with the usual pyro-soda formula sent out by the plate makers, and fix in hypo-soda. Wash thoroughly, and while this is proceeding make up a very hot bath of sodium chromate, and have it in a deep tray. When the washing is completed, plunge the negative into the hot alum solution and keep it there for five or ten minutes, then wash in water until it has been exposed to the light and remain sunken where it has been exposed. From this solution the plate is taken and washed; it is then placed in a strong solution of chloride of aluminium for ten minutes, then washed again and dried over the same. When dry, red oxide is ready for mounting on the back, or for electrotyping. If a small edition of prints is required an electrolyte is unnecessary, because the film is already as hard as and as difficult to injure as a copper block. It can therefore, in this case, be mounted on a type-high block with celluloid cement, as used for celluloid electrotypes, and it will stand all the impressions desired. Where a large edition is desired the film may be sent to the electrotypers and manipulated in the usual way.

There is no doubt, concludes Mr. Huylop, that this is the process of the future, being quicker, simpler, and cheaper than present methods; indeed, it seems impossible that uts can ever be made at a less price by this method.—\textit{Friend Printer,} and \textit{Scient. Amer.}

Photographic Notes.

Tolulol or Toluol.—A curious but possibly pondeable mistake was perpetrated lately by a photographic chemist. A formula for a matt varnish containing tolulol was handed to him to be made up, and his customer went away perfectly satisfied that he had obtained what was wanted. He tried it, and to his disgust found that he got a film of brown sticky matter which was not matt in appearance, nor would it dry. The result was a strongly-worded letter to the editor of the photographic journal, to whom the receipt was obtained. A polite request from the editor that some of the offending varnish might be sent him for examination brought back a 2-oz. bottle of some treacly-looking liquid, which smelt of toluol. Obviously toluol was mis-read tolu.

Powdered Zinc for Recovering Photo Wasters.—Dr. Stiebel, of Frankfurt, uses zinc in powder to get back the gold from toning baths. This agent renders excellent service in all quarters, and is better neutralised by an addition of alkali, otherwise it would be necessary to greatly increase the quantity of zinc powder necessary to weaken this acid, which is not the case when the solution is neutral or alkaline. Dr. Stiebel took for his experiments a solution of hypo-sulphite of soda of 1·5, which contained exactly per liter 1·0868 gr. of silver and 0·6440 gr. of gold; 350 cubic centimeters of this solution were treated with 4·30 gr. of powder, which had previously been strongly agitated in pure water. The mixture was stirred with care. At the end of ten minutes, when the liquid had regained all its limpidity, the filtered solution, treated with sulphide of potash, showed a black color, but no black opalescence, because all the contained silver. In the precipitate, Dr. Stiebel found: of 0·2715 gr. of silver = 98·84 per cent. of the quantity calculated; 0·1150 gr. of gold = 96·97 per cent. of the quantity calculated, that is to say, nearly the entire quantity of the precious metal that had been used. The advantages that this method has over the sulphite of potash process are twofold. First the gold and the silver are obtained by a single operation, then the solution of silver obtained in this manner possesses the sense of smell as for the products kept in the laboratory. Zinc dust allows the operation to be more rapidly performed than with the metal in sheets. On the other hand, the gold and silver obtained in the same manner are in small quantities, are more regularly distributed through the pulverulent matter. It follows that in filtering there is less danger of loss. One condition of success is to use exact quantities, say five times the supposed quantity of the precious metal, then to only use a very weak acid solution, and to carefully distribute the zinc powder in the solution. To those who might make the objection that the method proposed by Dr. Stiebel offers some danger by the possibility of arsenic dust in the solution, which might give rise to arsenical hydrocyanic, the author advises operating in the open air or in a laboratory having a good draught.—\textit{Paris Photographe.}
MARKET REPORT.

Chemicals and Drugs.

[The quotations here given are in all cases the lowest net cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the pharmacist. It is important that this should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.]

THE CHEMICAL MARKET.

THURSDAY, JUNE 20, 1886.

Since our last report, business in the chemical market has again been quiet, and few movements of importance have occurred. Crystal carbolic acid is again lower, but liquified acid is fractionally dearer. Both citric and tartaric acids are dull of sale, and cream of tartar is easier. Of the potash compounds, chlorate and permanganate are both very firm. Full details will be found below of the various articles of interest:

ACID, CARBOLIC.—A very quiet market generally. The current prices are as follows: Crystals: 84s. to 87s. 6d. per lb.; 89s. 6d. to 91s. 6d. per lb.; 36s. 6d. per cwt.; and 39s. 6d. to 40s. per cwt. (detached crystals), 7/4d. per lb.; these prices being for bulk quantities in 2 cwt. drums. Crude: Unchanged.

SIROPS:—Forty per cent. is quoted at 1s. 6d. per lb. and 75 per cent. at 1s. 6d. per lb. at 1s. 5d. per lb. at the market. Whisky at 96 per cent. Osyrate: Firmed at 1s. per gallon.

ACID, CITRIC.—Rather firmer. Manufacturers' quotations are unaltered. The market is firm at 9s. 6d. to 10s. 6d. per lb., according to quantity.

ACID, TARTRIC.—Quotations are unchanged at 1s. 1d. to 1s. 3d., but in second hands it cannot now be bought under 1s. 1½d.

ACID, TARTARIC.—Quotid and dull of sale. English brands of acid are easier, and 11½d. is now accepted. Foreign makes are unchanged, the price for both powder and crystal being 11½d.

AMMONIA SALTS.—Carbonate quiet at 3½d. to 3½d. Liquor unchanged at 8d. to 8½d. Sal ammoniac: First quality is steady at 36s., with seconds at 37s. Sulphate: A fluctuating market, and at the close is dull of sale, the quotation for grey 5½d. per cent. being 29½d. 6d.

ASHES.—Unaltered. Americans are still worth 40s., with pots at 28s.

ARBENIC.—Very firm owing to the continued scarcity of supplies. The price for best white powdered is 15s. 6d.

BLEACHING POWDERS.—In good demand at firm rates. On the spot the price is 27s. 8½d. to 27s. 10½d., whilst in Liverpool it is unchanged at 27s. 10½d. to 27s. 11½d., f.o.b.

BORAX.—Dull of sale at low rates in second hands. In spite of this Convention prices are maintained at 5½d. for powdered, and 10½d. for crystals. Second-hand holders offer at 1s. 6d. less.

COAL DISTILLATION PRODUCTS.—Benzole: Unchanged. 50 per cent. still offers at 11½d. per gallon, and the price of 50 per cent. is maintained at 1s. per gallon. Pitch is unchanged, the current quotation being 7½d. per ton, f.o.b. Tar is worth 10s. 6d. per barrel of 40 gallons.

COFFEE SULPHATE.—Firmer. The ordinary brands cannot now be bought under £15 2s. 6d., whilst special makes are very firm at £14 13s. 6d.

CREAM OF TARTRAR.—Quotid and dull of sale. Best white French crystals are now worth 67s. to 68s., whilst for German powder the price is 70s. to 71s.

MERCURY.—The quotations are unaltered, and the current rates are as follows, for quantities up to 50 lbs.:—

Colomb: 2s. 1d.; Corrosive sublimate: 2s. 7d.; Red precipitate: 3s. 2d.; White ditto: 5s. 2d.; Blue pill: 1s. 6d.; Bichloride: 5d. 6d.; Bichloride of mercury: 1s. 6d.

PROPHYLAX.—Steady. Sticks are worth 2s. 1d. to 2s. 2d. and weakers, 2s.

POTASH SALT.—Bichromate: Unchanged at 4½d. to 4½d. Chlorate: Very firm. On the spot the price paid has again been 2½d. per lb., whilst in Liverpool it has been selling steadily at 5d. to 5½d. Permanganate: Dearer. Small crystals are now worth 5s. 6d. to 5s. Prussiate: Dull of sale at 8½d. to 8½d. In Liverpool the price paid has again been 8d.

QUICKSILVER.—Steady. Second-hand holders still offer at 27s. 8d. to 27s. 6d., whilst importers maintain their prices at 27s. 10½d.

SALTPEPPER.—Steady. British refined is worth 8s. 6d. to 8s. 9½d. on the spot. In Liverpool, the price is 23s. 6d. in kegs, and 23s. in barrels.

SODA COMPOUNDS.—Bicarbonate: 27s. 5½d. in London, 28s. 15½d. in Liverpool. Anhydrous: 70s. per cent. is worth 8s. 9½d. per cent. 21½d. Crystal: 3½d. Hypochlorite: Firm at 26s. 15½d. to 27s per ton in Liverpool.

THE DRUG MARKET.

THURSDAY, JUNE 20, 1886.

The more interesting features of the Drug Market are briefly noted. Crudex camphor is dull of sale at a decline. Cocaine has been advanced in price, and further rise may be expected. Of the essential oils the most important advance is an advance in H.G.H. e± of peppermint, which closes firm and will probably dearer. Full details will be found below of the above articles of interest:

CAFFEINE.—On the spot it is exceedingly scarce, only small quantities can be had at 27s. per lb., and for delivery it is difficult to get a quotation. It seems that supplies have been much reduced, and the quotation are not uninfluenced than ever by their inability to fill orders. It was anticipated that the worst time had passed, so that a month's time more normal prices might be expected, but this has however not advanced, and the price remains at 90s. per gallon of 90s. occurred. At the close both China and Japan are quoted at 150s. c.i.f., June to August shipment. The price paid declined to 150s. on Friday, and on Monday a further 5s. 6d. occurred. At the close both China and Japan are quoted at 150s. c.i.f., June to August shipment, but there are no buyers.

CAMPHOR (CRUDE).—Since our last report there has been a very weak market at a considerable decline. At the close last week 160s. c.i.f., June to August shipment, was the price paid for both China and Japan. The price paid declined to 150s. on Friday, and on Monday a further 5s. 6d. occurred. At the close both China and Japan are quoted at 150s. c.i.f., June to August shipment, but there are no buyers.

CAMPHOR (REFINED).—Unchanged. The quotations of British and foreign refiners are still 1s. 6d. for 10 cwt. lots of bales and flowers, with squares at 1s. 10½d. and proportionate rates.

COCKLE.—Dull of sale. At the auctions the following prices were obtained:—Zanzibar, 3½d.; Penang, 7½d.; and Ceylon, 6½d. For delivery Zanzibar is steady, but rather quiet.

COCAINE.—The reduction noticed last week did not hold good very long, for in a few days the Connaught price was advanced 1s. per oz., and the current quotations are now as follows:—For 100 oz., 1s. 6d.: for 50 to 100 oz., 1s.: for 100 oz., 1s. 6d.: and for lots under 25 oz. 1s. 8½d. The price of refined in tins, 1 oz. bottles being charged 3d. per oz. more.

COCHINEAL.—Quiet. A small amount of business has been done privately in black at 1s. 6d. to 1s. 1d. and sober red at 1s. 6d. to 1s. 4½d.

CODINE.—Quotations remain unaltered at 10s. 4d. to 10s. 9d., according to quality and brand.

COLOGNUT.—Turkey is very firm, and holders ask for good apple. From Rhineland, 1s. is the lowest price we have no fresh arrivals since our last report. Exports from New York advise a strong demand in sympathy with the home market, and holders, both of French and Spanish, have advanced their prices, small quantities only of either variety being offered.

COPIA.—Dull of sale. Privately, fair to good Maranham sell at 1s. 8d. to 1s. 11d. For, 1s. 6d. to 1s. 7d., and Bahia and Maranoce at 1s. 6d. to 1s. 8d.

FLOWERS.—Nothing positive can yet be predicted as to the new crop, but some opinions prevail that it will be unsatisfactory. In consequence of these rumours very high prices have been paid for closed new flowers for immediate delivery. Borneo occurs to open new flowers 50s. per cwt.; half closed ditto 75s. and closed ditto, 100s., c.i.f.

FECACUANIA.—Carthagena root is scarce and very firm. For small second-hand parcels 8s. 6d. is the price, but the quotation is likely to be advanced, as it is now more than sufficient to cover as fresh arrivals. Rio (Brazilian) root sells privately at steady rates.

JALAP.—Privately Vera Cruz sells at steady rates, 1½d. being the price for fair quality, with damaged at 6d.
MENTHOL.—Dull of sale. The spot price for fair dry crystals is 12s. to 15s. 6d.

MORPHINE.—Unaltered. Hydrochlorate is still quoted at 4s. 6d. per lb. on wholesale quantities at 6s. 3d. per oz. or more.

OILS (ESSENTIAL).—Mr. Johnson, the British Consul at Pekin, in his last official report draws attention to the enormous increase in the amounts of Anisese and Cassia oils exported by China. During the year 1894, according to the figures being 283,400 lbs. for 1894, against 140,867 lbs. for 1893. He attributes this partly to the good crop and partly to the loss of a cargo whilst on its way to Europe, and indicates the importers to the different ports of the district. The oil is shipped to Hong Kong, and thence to Macao, where it is repacked into 1 lb. tins. It seems that the trade all lies in the hands of the Macao merchants, who have their representatives in Pekin. The trade in Cassia oil is stated to be a very profitable one, and would be still more so if it were not for the keen competition amongst the producers.

The spot price for fair dry crystals is 12s. to 15s. 6d. on the spot.

From China advice states that the market is somewhat firmer, and stocks are very small. Cassia: Is quiet at 4s. 6d. to 4s. 9d. on the spot for 75 per cent. oil. Reports from China state that no first quality oil is forthcoming, and what is obtainable is in but small quantities. Citronella: Firm at unaltered rates, the spot price for oil in tins being 1s. 4d. Clove: English oil offered at 7s. 7d. to 8s. 6d. Lemon-grass: Dull of sale at 1s. 11d. Pitcher: A fair quantity of oil is very difficult to obtain, and none can now be bought under 10s. per lb. Japanese oil, containing 40 per cent. of menthol, is worth 7s. 5d. to 7s. 6d., and demensothiolised, 5s. 6d. to 5s. 9d.

OILS (FIXED AND SPIRITS).—Castor: Steady. Fine Italian oil is still quoted at 30s. to 31s., c.i.f. Cotton: Firm at unaltered rates. Refined oil is still worth £18 to £18 5s., according to make and package. Coco-nutt: Dull of sale. Ceylon is worth £23 15s. on the spot. Coben: £22 10s. to 23s. 6d. to 24s. 6d., and Mauritius, normally £22 6s. to 23s. 6d. Linseed: Very firm at a further advance. In barrels on the spot it is quoted at £21 17s. 6d. Rape: Steady refined oil is now worth £23 on the spot. Turpentine: Lower and dull of sale. American spirit on the spot is worth 22s. 3d. Petroleum: Flat, with a lower tendency. American oil is quoted at 5s. 6d. to 5s. 11d.; Water white, 6d. 6d. to 6s. 4d.; and Russian at 6s. 3d. Petroleum Spirit: Ordinary, 5d. to 5d.; destilled, 6s. 3d. to 6s. 6d. The demand is now worth 30s. per lb., thanks to the yield of new oil being from 6000 to 7000 barrels less than last year, a high rate will necessarily be established for the rest of the year. The current rates for new oil is 12s. 6d. to 13s. 3d. at any rate, the quotations will be considerably higher.

OPIUM.—Turkey: For druggists' varieties there has been a good demand, but other kinds are dull of sale. The current quotations are:—Soft shipping descriptions, 11s. 3d. to 11s. 4d.; best druggists' 9s. to 9s. 3d.; seconds ditto, 7s. 6d. to 8s. 6d. Persian is steady at 15s. 6d. to 16s. 3d. for fine qualities.

ORIS ROOT.—Unchanged Florentine root being quoted 7s. 6d. per cwt. for good sorts, with best selected at 7s. 11s. c.i.f.

PERSIC BAISAM.—Somewhat dull of sale. Good genuine balsam offers at 9s. 3d. to 9s. 6d. per lb.

QUININE.—There have been no sales of importance during the week out prices are well maintained. H. B. and B. & S. are quoted at 1s. 6d. on the spot for moderate quantities.

SAFFRON.—Dull of sale, and quotations are lower. Super extra Persian is now worth 50s. 6d. per lb.

SALICIN.—Makers' quotations are unaltered, the current quotations for 1-ozt. lots being 5s., with 25 lbs. at 8s. 6d.

SALICIN.—The present price is 5s. 6d. per lb. net.

SOY.—Dull of sale and fair China offers at 1s. to 1s. 1d. on the spot.

TOLU (BAISAM).—Steady. The spot price for good Tolu Balsam is 1s. 6d. From New York a strong market exists for the oil, which has been quoted at 30s. per lbs. to its scarcity, and holders are by no means anxious to as there are no advices of any supplies coming forward at present.

WAX (JAPAN).—Very quiet, and good squares offered at 25s.

Trade Notes.

The British Antitoxine Company having pointed out to Mr. Lennox Brown, that his recent article on the failure of the antitoxic serum in diphtheria had caused many of the public and medical men to hurriedly conclude that he had been attacking their preparation, he has written them as follows:—"I am flattered by the suggestion that my disagreement with your claims of the so-called antitoxic serum in the treatment of diphtheria could in jure the sale of your antitoxine. But since you ask me, I am happy to re-echo the terms of your own letter, and to say that nothing one has been further from my mind than a desire to do your remedy the smallest injury, and that my adverse article referred to the anti-diphtheritic serum alone."

MESSRS. WILLIAM COOPER AND NEPHEWS, the well-known sheep dip manufacturers of Berkhamsted, have determined to give every farmer in the United Kingdom whose name and address are obtainable, a chance of expressing his opinion on the various questions affecting the agricultural industry, and with the object of carrying out this gigantic and costly scheme, a circular with an exhaustive series of questions attached, has been dispatched to the occupier of every holding in Great Britain. It is intended to tabulate the opinions received, and to issue a report containing a digest of such opinions.

MESSRS. POWELL AND BARTLOW, of 58, Blackfriars Road, London, S.E., submit revised price-lists of the different goods which they supply, including surgical instruments, elastic gum, rubber and gutta-percha goods. The lists should be found of very important to chemists and druggists.

FALLOWFIELD'S 'Photographic Remembrancer' for June contains particulars of a large number of novelties and useful lines for photographers, and in the supplementary spring season sale-list of photographic material materials are given of the best British and foreign. The Blackstaple series is also continued. Copies may be seen at the offices, 146, Charing Cross Road, W., for a copy.

MESSRS. BURGHOUG, WELLMORE AND CO., of Snow Hill Buildings, London, E.C., forward a tube containing one grammes of dry anti-diphtheritic-serum (B. W. and Co.) prepared in the form of fine golden scales. The firm claims to have been the first to prepare anti-diphtheritic-serum in this active, portable, and permanent form, possessing the full potency of the liquid serum. The therapeutic activity of the contents of each tube of this dry anti-diphtheritic-serum (B. W. and Co.) is attested by the medical director in charge of their Bacteriological Laboratory, and is guaranteed. The dried serum is freely soluble in about twice its volume of cold water. The contents of the tube represent 10 cubic centimetres of the normal liquid anti-diphtheritic serum, and it is customary to dissolve the quantity of the tube in 100 cubic centimetres of cool water, which has been previously boiled. This form of the serum is guaranteed to keep for any reasonable period under ordinary conditions—a great advantage over the fluid serum, which is very difficult to preserve for any length of time. Anti-diphtheritic serum axio. (B. W. and Co.) is supplied in these 1 gramme tubes at 1s. per tube.

MESSRS. TAMM AND CO., Boscombe, have a dark-room free to customers for changing from 9 a.m. to 8 p.m., and hold a stock of all the leading plates, papers, and photo requisites.

Mr. CHAS. CROOK, chemist and druggist, Easthorpe, Mirfield, Xorka, has also a free dark-room for changing and developing, and stocks plates, papers and chemicals.
Personal Notes.

Mr. William Baxter, pharmaceutical chemist, has purchased the business lately carried on by Mr. C. M. Footitt, at Great Marlow, Bucks.

Mr. Footitt had conducted the business for twenty-five years, and was preceded in the proprietorship by his father.

Mr. R. T. E. Eastern, F.I.C., who has for many years acted as assistant to Dr. Atfield, is to succeed Mr. F. W. Short, B.Sc., as demonstrator at the School of Pharmacy.

Mr. Thomas Tickle, a former Bell Scholar, who is at present working in the Pharmaceutical Society's Research Laboratory, will act as assistant-demonstrator in the School.

Dr. F. Schütz, of Kiel, has been appointed Professor of Botany and Director of the Botanical Gardens and Museum, at Greifswald University.

Dr. C. C. D. van Wijk, of the University of Amsterdam, has been appointed Professor of Pharmacology and Chemistry at the University of Leiden.

Professor Huxley has had a relapse, and is reported to be in a critical condition.

Exchange.

[Notices of books, apparatus, etc., for exchange, of reasonable length, are inserted free in this column, if they do not partake of the nature of ordinary advertisements. The notices should be sent to the Editor, 17, Bloomsbury Square, W.C."

WANTED.

'PHARMACEUTICAL JOURNAL', February 28, 1885.—Full price will be paid by the Secretary, 17, Bloomsbury Square, London, W.C.

British Pharmacopoeia, 1878, if complete, payable condition; lowest offer accepted. — Black, 381, Lower High Street, West Bromwich.

Composition Mortar, 17 in. diameter, and pestle.—Hill, Chemist, Lincoln.

OFFERED.

Year-Book of Pharmacy, 1874 to 1879, good condition, what offers? British plants or mocs preferred—Allen, Chemist, Canning Town, E.

Books for Minor, etc., various, cheap; also pocket microscope, botanical lenses. Stamp for descriptive list—3, Crosby Road North, Waterloo, Liverpool.

BICYCLE.—Coventry Machinists’ "Swift"; pneumatic tyres, ball bearings throughout. Good condition, with all accessories. Cost £21, to take £10 10s. — Apply Simpson, 6, Stonebridge Park, Willesden.

Stomach PUMPS, Pestle and Mortar, and Dispensing Scales, for disposal by widow of chemist in needy circumstances; all in good condition. Apply by letter to A. B., care of Mr. Bremeridge, 17, Bloomsbury Square, W.C.

STRAWMIONIUM PLANTS.—Have a quantity suitable for botanical specimens. Price, 2s. per dozen.—Williams, Chemist, Longfleeth, Poole.

TRICYCLE, strong and well made, 48 in. wheels, indiarubber tyres. Price 25s. cash.—G. N., 6, Ringford Road, Wandsworth.

Cricket News.

Wight, Layman, and Umnery’s C.C. v. Stafford Allen’s C.C.—A match between the representatives of these two wholesale houses was played on the ground of the former, at Hyde Farm, Belham, and resulted in a win for the Southwark Six, who scored 93 to their opponents 53.

Diary of the Week.

SATURDAY, JUNE 22.

Pharmaceutical Cricket Club v. Cheam Common (Worcester Park). Train leaves Waterloo at 2.10 p.m.

TUESDAY, JUNE 25.

Royal Photographic Society, at 8 p.m.

"A Demonstration by Mr. Packham of his Process of Toning Platinum Prints."

WEDNESDAY, JUNE 26.

Society of Arts, at 3 p.m.

Excursion to Colinton Dell. Leave Caledonia Station at 8.30 p.m.

Plymouth, Devonport, Stonehouse, and District Chemists' Association (Junior Section), at 5.30 p.m.

Fourth Lecture on Materia Medica, by Mr. John D. Turney.

THURSDAY, JUNE 27.

School of Pharmacy Students' Association, at 7 p.m.

Annual Report of Executive Committee.

School of Pharmacy, at 5 p.m.

Presentation of testimonial to Mr. F. W. Short, at 17, Bloomsbury Square, W.C. Past and present students at the School are invited to be present.

Company Business.

PIONEER SYNDICATE, LIMITED.—Registered on June 10, by W. H. Morrell, 98, High Holborn, W.C., with a capital of £5000 in 21 shares, to carry on the businesses of chemists, druggists, grocers, wine merchants, etc., in all or any of their respective branches. Registered without articles of association.

KENT DRUG STORES, LIMITED.—Registered on June 5 by E. David, 44, Charles Lane, W.C., with a capital of £5000 in 21 shares. Object, to adopt and carry into effect a certain agreement, and to carry on the general business of chemists and druggists.

Late Advertisements.

Assistants Wanted.

AT CDSO a JUNIOR ASSISTANT. Must be a good Dispenser. Indoors. State age, height, previous experience, with references and photo to STURTON & SONS, Wholesale Druggists, Peterborough.

SUNIOR ASSISTANT. Indoors. Qualified. Age 25 to 30. Must be a good Counterman, with a knowledge of Prescribing. Apply personally, between 12 and 1 p.m., and after 7 p.m., or by letter, with full particulars, enclosing photo if convenient (to be returned), to DREW THOMPSON & Co., 137, Queen's Crescent, N.W.

Businesses for Disposal.

SURREY. 10 miles from City.—An exceptionally profitable Retail, Dispensing and Prescribing Business, with good specialities. Returns £600. Net profit fully 50 per cent. Corner shop. Long lease. Rent £50. Same hands 8 years. Owner having built a larger but better shop, now is selling for less. Price £550. Apply HARRIES & Co., 40, Aldermary St., E.C.

CHEMIST'S (suburban).—Thoroughly genuine well-established Business, for immediate disposal. Excellent premises. Capital position. Moderate rent. Good-class profitable trade. All connections going for superior fitting. Stock, &c., about £200; or by valuation, without premium. Exceptional opportunity. MESSRS. WICKENDEN, 20, High St., Tunbridge Wells.
Personal Notes.

Sir Edward Maunde-Thompson, Chief Librarian of the British Museum, has been elected a corresponding member of the Philosophical Historical Section of the Berlin Academy of Sciences.

Dr. Thornes Thornes has been elected a foreign member of the Société Française d'Hygiène.

Professor Fraser is stated to have obtained definite proof of the antidotal properties of the blood serum of venomous serpents, and he will shortly publish a further communication on the subject.

Mr. W. Spencer Turner, pharmaceutical chemist, has purchased a business at Willingham, Camb.

Mr. William J. Bethune, Inverness, deputy-superintendent of the Pharmaceutical Society's First Examination, was married at 274 High Street, Forres, on the 19th inst., by the Rev. Dr. Keith, to Bella, second daughter of James Bowie, Forres.

Mr. Josiah Clarke, pharmaceutical chemist, Croydon, has suffered from the effects of a fire which broke out on the evening of June 23, in the upper part of the building in which his pharmacy is situated.

Mr. John Hallaway, pharmaceutical chemist, Carlisle, is to be congratulated on the fresh success of his son, B. B. Hallaway, a Student of the Pharmaceutical Society, who has just passed his final examination for the Associateship in Science of the Durham College of Science, with honours and prizes in Chemistry.

According to the Pall Mall Gazette, the Rev. (sic) Professor Michael Foster has received the honorary degree of Doctor of Civil Law at Oxford. Presumably the respected Secretary of the Royal Society is referred to, since he was thus honoured, together with Sir William Henry Flower, of the British Museum, and others, at the Oxford Commemoration on Wednesday last.

Professor Ricker is reported to have accidentally inoculated himself with the virus of diptheria, whilst investigating the antitoxic treatment of the disease.

Trade Notes.

Mr. John Mines, of the Antiseptic Dressings Factory, Ladywell, S.E., offers a new arrangement and operation sheet, consisting of a pad of sterilised cellulose enclosed in an outer covering rendered antiseptic by treatment with corrosive sublimate. It can be made in various sizes, but the most convenient one is 2 feet square, and costs 1s. 6d.

Messrs. Burroughs, Welcome and Co. have received from a correspondent in Shansi, North China, a letter, from which the following is an extract:—"The two cases of tea 'tabloids' reached us here a few days ago. In this part of China—indeed, all over China north of the Yellow River—tea is comparatively little drunk; the soil and climate being unsuitable for its cultivation, and the time and difficulty encountered in transporting up from the Yang-tse valley renders it somewhat expensive. Boiled water and thin gruel of millet are the usual drinks of the masses, so that the tea 'tabloids' are greatly appreciated by us. The ingenuity which is displayed in the 'tabloid' 'it, I need scarcely say, very striking in the eyes of the Chinese as well as our own."

Mr. A. D. Rae, chemist and druggist, 6, Railway Place, Fenchurch Street, E.C., has fitted up a free dark-room for customers.

Mr. William Tylor, 14, High Street, Aston, Birmingham, will send a new edition of his price-list of novelties and useful appliances on receipt of price-fourpence.

The Eastman Photographic Materials Co., Ltd., Oxford Street, W., has recently commenced to publish a small penny monthly paper—the Kodak News. The June number contains several notes of interest to photographers and others, especially two on the Kodak inside the Great Pyramid and in the Land of the Pharaohs.

Messrs. Burroughs, Welcome and Co. have arranged an admirable programme of arrangements in connection with the Seventh annual dinner and excursion of their employees, on Saturday, June 29. Special trains leave Dartford and London Bridge at 7.45 a.m. and 8.15 a.m., respectively, arriving at Portsmouth at 10.45 a.m. Dinner and tea will be served at the Esplanade Hotel, Southsea, and the special train will leave Portsmouth at 7.55 p.m.

Messrs. Tife and King, chemical manufacturers, advise their customers that their City address will in future be 7, Jeffreys Square, St. Mary Axe, E.C.

The Apollinaris Company, Ltd., sends the following note on a New "Departure" in the Natural Mineral Water Trade:—"The Curisbrook Castle sailed from London for the Rhine on the 13th inst. with a cargo of Royal German Soltzer Water, consisting of 146,000 full bottles. These bottles were brought over to London from Germany last year, and it cannot be said that they are sent empty away! It is to be presumed that the large advertisements which have appeared in recommendation of this water have not met with the anticipated response from the British public. What has occurred will doubtless act as a check upon those enthusiastic persons who are even now introducing new German mineral waters into this country."

Literary Intelligence.

Messrs. Longmans, Green and Co. have nearly ready Mr. H. S. Hoole Waylen's 'Thoughts from the Writings of Richard Jefferies.' The same publishers have in preparation two books on chemistry and physics to meet the new requirements of the Science and Art Department, namely, 'Inorganic Chemistry' by G. S. Newth, F.I.C., F.C.S., Demonstrator in Physics in the Royal College of Science, London; Assistant Examiner in Chemistry, Science and Art Department; and 'Physics' by W. Watson, B.Sc., Demonstrator in Physics in the Royal College of Science, London; Assistant Examiner in Physics, Science and Art Department.

A readable article on "Rhubarb" appears in Chambers' Journal for June, the history and cultivation of that edible being dealt with in an interesting fashion. There is also an article on "Ginseng" which should interest pharmacists.

Bentley's Botany is no more, the new manual published by Messrs. J. and A. Churchill, being described as "based upon the manual of the late Professor Bentley," by Dr. J. Reynolds Green, Professor of Botany at the Pharmaceutical Society, who recently elected a Fellow of the Royal Society. The first volume only has been issued, and is devoted to morphology and anatomy, the latter section having been almost entirely re-written, while the chapters on morphology have been brought up to date.
THE DRUG MARKET.

Thursday, June 27, 1895.

The drug sales to-day passed off very quietly. A limited amount of business was done in Brazilian ipecacuana at fair rates, to dearer rates in Carthagoa root was offered. Benzoin was largely offered, and a fair amount was sold at easier rates. Cubebes and gamboge sold cheaply, but cardamoms were very firm, especially for the better qualities. Full details will be found below.

The quotations here given are in all cases the lowest net cash prices for bulk quantities, and often the articles quoted have to be sorted in order to suit the requirements of the pharmacist. It is important that this should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

THE CHEMICAL MARKET.

Thursday, June 27, 1895.

The most important features in the Chemical Market are as follows:—Carbolic acid is very dull of sale, and the prices are lower all round. Citric acid is fractionally lower, and tartaric acid is dull of sale. There are few inquiries for cream of tartar, which is considerably cheaper. Of the potash salts, chlorate has again been a firm market. Full details will be found below:

**ACID, CARBOLIC.**—A very flat market owing to the absence of few inquiries. Quotations are lower all round. The current prices are as follows:—**Crystals:** 29/6 to 30/6 C.; 6/3d. per lb.; **Tartar:** 28/9 to 40/6 C.; 6d. per lb.; **Detached crystals,** 7d. per lb. **Crude:** 50 per cent. is quoted at 1s. 6d., with 76 per cent. at 1s. 9d. **Liquid:** —

**ACID, CITRIC.**—Quiet. Manufacturers' quotations are 1s. 9d. per lb., whilst in second hands it can be bought for 1s. 11d. per lb.

**ACID, OXALIC.**—Unchanged at 3½s net ex rail.

**ACID, TARTARIC.**—Quiet at unchanged rates. For **English brands of acid 11½d. is the price, whilst foreign makers quote both powder and crystals at 1s.**

**AMMOMIA SALTS.**—**Carbonate:** Quiet at 8½d. to 8½d. **Liquor:** Unchanged at 8d. to 8½d. Sal ammoniac: **Both firsts and seconds are unchanged at 8½d. and 7½d. respectively.** **Sulphate:** Quiet, but fairly steady. At the close grey 24 per cent. is worth 20s 17½d. 6d.

**ASHES.**—Unchanged. Canadian pot ashes are worth 23½s, with pearl ashes at 40s.

**BLEACHING POWDER.**—Unchanged. The spot price is £2 3s to 3s 6d. per ton in Liverpool it is unchanged at £2 10s to £2 15s, f.o.b.

**COAL DISTILLATION PRODUCTS.**—**Benzole:** Lower. 50 per cent. is now worth 11d., with 90 per cent. at 11½d. per gallon. **Pitch:** Steady at 8½s. 6d. per ton, f.o.b. **Tolu:** Firm at 11s. per barrel of 40 gallons.

**COPPER SULPHATE.**—Steady at unaltered rates. The quotations range from 21½s. 6d. to 21½s., according to brand.

**CREAM OF TARTRATE.**—Dull of sale at lower rates. Fine while French crystals are now quoted at 30s. 6d. to 31s. with German brands of powder at 29s. 6d. to 31s.

**POTASH SALTS.**—**Bichromate:** Unchanged at 4½d. to 4½d. **Chlorate:** Reports from New York state that the market is very firm and higher prices are generally anticipated, in consequence partly of the strong tone of the home market. On the spot 5d. has been paid, whilst in Liverpool the same rate has been paid, but the demand has slackened. **Permanganate:** Firm at 54s. 6d. to 55s. for small crystals. **Prussiate:** Quiet at 8½d. to 8½d. **The Liverpool price is 5d.**

**QUICKSILVER.**—Steady. Second-hand belters continue to offer at £7 5s. to £7 8s. whilst importers' prices are maintained at £7 10s.

**SALTPEAR.**—Unchanged. British refined is quoted at £2 11½d. to 12s. in the spot. In the Liverpool the price is 23s. 6d. in kegs, and 23s. in barrels.

**SODA COMPOUNDS.**—**Bicarbonate:** 27s. 6d. in London, £6 15s. in Liverpool. (autic: 70 per cent. is worth 25s. with 80 per cent. at 25s. less. Crystals: 50s. Hypophosphite: Much dearer. The Liverpool price is 27s. to 27s. 10d.**
Cassia Fistula.—Of 41 bags of fair Dominica pods, 9 sold at 18s.

Cayenne Pepper.—A single case sold at 6d. per lb.

Cherette.—Dull of sale. Eleven bales were bought at 3s.

Cinchona.—At the bark sales on Tuesday, the 25th instant, the consignment offered was considerably less than last month, and met with a good demand at fully steady to desirer rates. To-day 96 serons sold freely at 9d. to 11d., with first-class damaged at 7d., and second ditto at 6d. to 5s. Cortexaegusa bark was bought in at is. to 10d. per lb. on the spot. Only a few bales of Ambhoa were offered, which were bought in at 45d. Zaniber are firmer privately at 2s., July to September delivery.

Coca.—Fair broken Truxillo leaves of good colour were bought in at 5s. 6d. per lb. to 1s. the limits being 1d. less. A single package of Ceylon leaves sold at 1s. for first-class semi-damaged.

Cocaine.—Unchanged. 100-oz. lots are quoted at 10s. 6d. per oz., with smaller quantities in proportion.

Colocynth.—Two cases of fair Turkish apple were bought in at 5s. and 11d. each, and a case of broken Spanish at 10d. to 1s. 4d., according to quality.

Copal.—Dull of sales. Three cases of pale cloudy Marsham were bought in at 1s. 6d.

Copper.—A parcel of 28 bales of Bombay seed sold at 5s. to 7s. 6d. Another lot, also from Bombay, sold "without reserve" at 5s. to 6s. 4d.

Curcuma.—Sold freely at a considerable fall. A parcel of 400 boxes of fair brown Sricks berries sold at 94s. to 35s., and another parcel part sold at 32s. 6d.

Cummin Seed.—Fair Mogador seed was bought in at 28s.

Dill Seed.—Neglected. Sixty-three bags were bought in at 18s. to 15s.

Dragon's Blood.—None was sold to-day. Good bright gum, partly broken, in reed was bought in at 23s. 6d., fair bright seedy lump at £27 to £23 10s., and dark saucers at £26 10s.

Eleum Gum.—A parcel of 51 cases of Manilla gum sold freely at very firm rates, ranging from 55s. for good clear pale gum down to 28s. 6d. for somewhat dirty ditto.

Ergot.—Weevily Spanish was bought in at 8d.

Fennel Seed.—Fair bright East Indian seed was bought in at 18s. to 15s.

Gamboigne.—Lower. Good free pipe of clean fracture sold very grossly at £17 10s. 6d., and somewhat dull ditto at £20 to £20 8s. 6d., for fair good free pipe, £29 for blocky pipe, and £25 10s. for pickings.

Gualacium.—Sold at 1s. 11d. to 2s. for good gum of bright fracture down to 1s. 4d. Drossy grades were bought in.

Guaiacum.—Very dull of sale. The only parcel sold to-day was 3 cases of darkish brown Jamaica, which fetched 22s. 6d. Australian was bought in at 20s. to 25s., and Californian at 45s.

Ipecacuana.—A moderate supply only found purchasers to-day, but the prices realised were high. Good sound annulated Brasiliun (Rio) root sold at 4s. to 4s. 6d. No Carthageaus root was offered, and it is very scarce for odd qualities holders ask 32s. 6d. per cwt.

Insect Flowers.—Hofmanns reports no change in the market, and quotes open flowers at 50s. per cwt.; half-closed ditto, 75s. per cwt.; and closed cultivated ditto at 100s.

Jaborandi.—Bold gruyish leaves were bought in at 9d., and mixed leaves, with a lot of wood, were bought in at 6d. to 8d.

Jalap.—The better qualities of Vera Cruz were bought in at 1s. 6d. to 1s. 11d. Bes-damaged root fetched 6d.

King's Treasure cases of red gum mixed with bark were bought in at 50s., and good genuine gum in tears at 250.

Kola.—None was sold to-day. West Indian were bought in at 10d. to 1s. 6d.

Kola.—In steady demand. It is quoted at 200s. per cwt., c.i.f.

Mastic.—Seventeen cases of good bright gum in tears were bought in at 3s. to 3s. 6d.

Mastic.—Dull of sale. On the spot 18s. 9d. to 14s. per lb. is asked for good white, dry crystals. To-day two cases of Cocking's were bought in at 17s. 6d.

Myrrh.—A trifle easier, and there is no demand. To-day fair clean pickings sold at 45s. 6d. per cwt., good clean dittot 50s., also subject. The remainder was bought in at 92s. 6d. to 110s. for fair to good picked gum, fair to good pickings, 35s. to 65s., down to 20s. for dark chips.

Nutmeg.—Selling at very low rates, medium pale seed from Calicut sold at 8s. 6d. to 9s., and small ditto from Madras at 3s. 6d. to 4s., with damaged ditto at 3s. to 3s. Good bold Bombay seed was bought in at 15s.

Oils (Essential).—Star Anise remains dull of sale at 6s. 2d. to 6s. 3d. on the spot. Cloveput: 20 cases were bought in to-day at 2s. 8d. Cinnamon: No inquiries. Nutmeg: Not in stock at 4s. 7d. per lb., oil selling 70 to 75 per cent. cinnamon alcohol. Citronella steady. On the spot 1s. 4d. per lb. is the price for oil in time. Fisner's oil was bought in at 23d. per oz. Lemon oil sold without reserve. Lemon grass dull of sale at 15s. 6d. Bays made "without reserve" at 4s. Orange sold "without reserve" at 3s. Peppermint, H. G. Hooker's: Five cases sold to-day at 10s. per lb. Cocking's was bought in at 6s. 6d. and 40 per cent. Japan at 2s. 8d.

Oil (Cod-Liver).—Idal borh reports the continued firmness of the Bergen market, and unaltered quotation of 17d. per barrel of 26 gallons.

Oils (Fixed) and Spirits.—Coconut quiet. Ceylon is quoted at 23s. 6d. to 23s. 11d. Cork at 24s. to 25s. 10s., and Muscatel, 25s. to 25s. 10s. Cotton steady. Refined oil is quoted at 18s. to 18s. 6d., according to make and package. Linseed very firm at a slight advance on the spot in barrels it is quoted at 23s. 6d. Refined good olive oil at 18s. 6d. to 22s for refined oil on the spot. Turpentine falling steadily. American spirit is now worth 31s. 6d. on the spot. Petroleum firm. American oil is quoted at 6d.; water white, 9d. to 10d., and Busses, 6d.

Orto de Rosso.—Reports state that the collection this year has not exceeded 5400 kilos., which compares favourably with last year, but as there is no old stock the price will in all probability not be advanced.

Orum.—Turkey: For druggists' kinds a fair demand continues, but quantities remain dull of sale. The present quotations are:—Soft shipping descriptions, 11s. 5d. to 12s. 6d. for best qualities, with seconds at 10s. 6d. to 10s. 9d.; best druggist's, 9s. to 9s. 8d.; seconds ditto, 7s. 6d. to 8s. 6d. Parcels steady at prices ranging from 11s. for common grades up to 12s. 9d. for fine qualities.

Quinine Sulphate.—There are but few enquiries, and quotations are fractionally easier. H. B. & J. B. are quoted at 1s. 94d. on the spot.

Saffron.—Unchanged. Super extra Valencia is worth 23s. 6d. per lb.

Orange Peel.—Very dull of sale. Good thin cut Maltese was bought in at 9d., coarse ditto at 4s. to 45d.

Brahma.—Dull of sale. A few cases of high dried Canton of fair fracture sold at 9d. to 10d., and small round Canton of pinch fracture at 1s. 6d. per lb.

Sarraparilla.—Ordinary Jamaica sold at 8d. 6d., good grey Jamaica at 1s. 2d. to 1s. 4d. Mexican at 3s. 6d. to 3s. 7d. Honduran was bought in at 1s. 1d. to 1s. 2d.

Scammony.—Twenty-four bales of good bold root sold at 5s. 6d.

Sengoa.—Bought in at 1s. 5d. The spot price is about 1s. 3d.

Senna.—A small amount only of Tinniswylt leaves was offered to-day, and fairly steady prices were fetched at 2s. 6d. being paid for fine green medium to bold, 2s. 5d. to 2s. 8d. for medium greenish, and 1s. 1d. to 2s. 5d. for ordinary small leaves. All the Alexandria leaves and pods were bought in.

Senna.—A parcel of East Indiamen sold freely at 5s. 6d.

Thyme Seeds.—Bought in at 8s. 6d. to 9s.

Tulu Balum.—On the spot 1s. 7d. has been paid. At the sales to-day 1s. 1d. to 1s. 4d. to 1s. 11d.

Wax (Besse).—There was a large amount of Jamaica and Madagascar wax offered. The former sold at 27 17s. to £28 5s., showing a fall of about 2s. 6d. Blesched East Indian sold at 30 7s. 6d., Zanzibar at 25 12s. 6d., at 27 17s. 6d., and Madagascar at 26 12s. 6d. to 27 10s.

Wax (Japan).—Fifty cases of fair squares sold at 35s. per cwt.
Exchange.

[Notices of books, apparatus, etc., for exchange, of reasonable length, are inserted free in this column, if they do not partake of the nature of ordinary advertisements. The notices should be written on post-cards, addressed "Editorial Department, 17, Bloomsbury Square, W.C."]

WANTED.

‘Pharmacetical Journal,’ February 22, 1885.—Full price will be paid by the Secretary, 17, Bloomsbury Square, London, W.C.

Books. —Prantl and Vines’ ‘Botany,’ Fownes’ ‘Watt’s Inorganic Chemistry’; must be latest editions.—G. W. Kendall, Market Place, Bedall.

Squire’s ‘Companion,’ 1894, in good condition.—Lowest price to Jenner, Chemist, Meeting House Lane, Pockham, S.E.

Lancaster's Omnigraph ¾-plate camera.—Lee, Chemist, Guiseley.

Books. —Lindley’s ‘School Botany,’ and Flückiger and Hanbury’s ‘Pharmacographia.’ State lowest price, or will exchange ‘Taylor on Poisons’ or Brown’s Manual of Assaying.’—Chenows, 46, Harcourt Road, Sheffield.

OFFERED.

Dispensing Screen 4 feet, mahogany and plate glass with marble slab. Drawing sent.—Barrow, Chemist, Newmanst.

Pereira’s ‘Materia Medica,’ Vols. I. and II., 1929 printed pages, 365 illustrations, 1842; by Longman, Brown, Green, and Longmans, in good condition.—Chemist, 9, Queen Street, Edgware Road, W.

Dalmeyer R. R. lens, 8½ by 6½, Waterhouse stops, 90s. Hand camera (Prima), 8½. Barfoot, Compton Street, Chesterfield.

Reagent Bottles. —Twenty-nine good 4-oz. glass-stoppered bottles, and twenty-two 2-oz. Any reasonable offer accepted.—Simpson, Stonebridge Park, Willesden.

Portable Assay Balance, with rider, carry 2 grammes in each pan, turn with 0½ milligramme, fitted mahogany case, new to order, received too late for customer, bargain.—Allen, Chemist, Plymouth.

Partnerships Dissolved.

[From the London Gazette.]

Walter Manuel Harvey Elliott and Frank Edwin Howell, trading as Manuel, Elliott, and Howell, manufacturing chemists, Backfield, Moorhead, Sheffield.

Robert Nathaniel Mitchell and William Joselyn Foster, carried on under style of Mrs. Mitchell and Foster, in the profession of Doctors of Medicine, at Chester House, Wickham Road, and 74, Lewisham High Road, Kent.

Henry James Deacon and George Ernest Davis, chemists, High Street, Beckenham, carrying on business under style of H. J. Deacon and Co. Debts will be received and paid by H. J. Deacon.

Edward Stanley Beckett and Charles Beckett, carrying on business as airoiled water manufacturers at Hill Street and Hylop Street, Liverpool, under style of E. Beckett and Co. The business will be continued by E. S. Beckett under same style as previously.

Joe Kaye and John Crossley, trading as the Eiland Airoiled Water Company, at Eiland, Yorks.

Photographic Exhibitions.—This month and next will see two exhibitions in London, the one to be held at the Agricultural Hall, Islington, in connection with the Tobacco Trades Exhibition, which some eccentric wag has aptly said will probably all end in smoke, and the other at the Royal Aquarium, Westminster. What photography has to do with tobacco and vice versa is not quite clear, except that most photographers smoke inordinately.

Diary of the Week.

[Notices for insertion under this heading should reach the Editor on or before Wednesday.]

MONDAY, JULY 1.

Royal Institution of Great Britain, at 5 p.m. General Monthly Meeting.

TUESDAY, JULY 2.

WEDNESDAY, JULY 3.

Pharmaceutical Society of Great Britain. Council Meeting at 11 a.m. Plymouth, Devonport, Stonehouse, and District Chemists' Association, at 7.30 p.m.

“Night Charges for Dispensing,” discussion on, introduced by J. D. Turney.

FRIDAY, JULY 5.

Geologists' Association (London), at 8 p.m.

Trade Marks Applied For.

[From the Trade Marks Journal.]

No. 186,753. CHEMICAL SUBSTANCES used in manufactures, photography, or philosophical research, but not including acids, alkalis, vitrified porcelain enamel for coating metals, or anti-corrosives, and not including any goods of a like kind to these excluded goods.—Colthurst and Harding, 11, Queen Victoria Street, London, E.C. April 1, 1885. Device: A kangaroo.

No. 187,347. CHEMICAL SUBSTANCES prepared for use in medicine and pharmacy.—The Tazoo Company, 39, Baker Street, London, W. May 1, 1885. Device: A dish with handle with the name of applicants printed on.

No. 188,286. FULLER'S EARTH for manufacturing purposes.—The British Fuller's Earth Company, Limited, Woburn Sands, Bucks. April 29, 1885. Device: A boar's head and the initials of applicants at four corners. The essential particular is the device.

Late News.

PHARMACEUTICAL SOCIETY OF IRELAND, R. FAYLE.—Judgment was delivered in this case (see PA. J., June 16, p. 1161) on Thursday last, when the defendants were convicted of selling poisons without being qualified under the Irish Pharmacy Acts. Mr. Smith, inspector, imposed miscellaneous penalties on each of the three defendants, with costs, amounting in all to ten guineas.

Late Advertisement.

Business for Disposal.

SPECIAL.—A good opportunity to succeed to a selected Prescribing and Dispensing Business. Sample town, North Wales. Cash required about £1000; part can remain. Address, Box 51,673, Smith's Adv. Agency 132, Fleet St., E.C.
